Director of Nuclear Reactor Regulation
 Attn: Mr. Victor Stello, Jr., Director
 Division of Operating Reactors
 U. S. Nuclear Regulatory Commission
 Washington, D. C. 20555

Dear Mr. Stello:

Re: St. Lucie Unit No. 1 - Docket No. 50-335
Environmental Technical Specifications Report

Florida Power & Light Company is submitting the attached reports in accordance with Specifications 4.2 of Appendix B.

Very truly yours,

Robert E. Uhrig
 Robert E. Uhrig
 Vice President

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that this is essential for ensuring the integrity of the financial statements and for providing a clear audit trail.

2. The second part of the document outlines the specific procedures that should be followed when recording transactions. It details the steps from identifying the transaction to posting it to the appropriate ledger account, and finally to preparing the trial balance.

3. The third part of the document discusses the various methods used to verify the accuracy of the records. It covers techniques such as double-checking calculations, reconciling bank statements, and performing physical counts of inventory.

4. The fourth part of the document addresses the role of internal controls in preventing errors and fraud. It describes how a well-designed system of internal controls can help to ensure that all transactions are properly authorized and recorded.

5. The fifth part of the document discusses the importance of regular reviews and audits. It explains how these processes can help to identify any discrepancies or weaknesses in the accounting system and to take corrective action as needed.

IMPINGEMENT OF AQUATIC ORGANISMS - MARCH 1976

During the month of March, no intake screen washings were sampled, because the circulating water pumps were operated intermittently. Any samples taken would have resulted in irrelevant data.

IMPINGEMENT OF AQUATIC ORGANISMS-- APRIL 1976

Impingement studies at the Florida Power & Light St. Lucie Plant were initiated in April, 1976. Although the plant was not in operation, testing of the circulating pumps enabled us to obtain three complete 24-hour samples (Tables I-1 through I-3). These samples were taken at approximately one week intervals. All of the fishes and commercially important invertebrates are herein reported. Although not presented in the tables, data were recorded on other invertebrates impinged (such as other species of crustaceans, jellyfish, and polychaete worms). Throughout this study, length is recorded to the nearest millimeter. Standard length, from the tip of the snout to the base of the caudal fin, is the measurement used for the majority of fishes. Carapace (shell) width is used for measuring crabs; carapace length for shrimp and lobster. Weight is generally recorded to the nearest gram. Fishes and shellfishes were weighed and measured individually up to 25 specimens. A range of lengths and the combined weight was obtained for the balance of individuals when over 25 specimens were collected. For monthly reports on impingement, the data from individual measurements have been combined and are presented in major size groupings.

TABLE I-1
 IMPINGEMENT, ST. LUCIE, 1-2 APRIL 1976.

TIME	SPECIES	Number of Individuals	Range of Standard Lengths (mm)	Weight (gms)
0100-0930	shrimp	7	14-25	30
