During steady state operation, surveillance test N1-ISP-RE22 found a main steam high flow switch with a setpoint of 107.5 psi. T.S. 3.6.2b requires a setpoint of 105 psi +/- 1.0 psi. This condition resulted in minimal safety implications. Three redundant instruments were available in the same channel.

RE22G, a Barton Model 278 differential pressure flow indicating switch drifted from a setpoint of 105.7 psi. It was reset to 105.0 psi. Current surveillance testing schedules are adequate to insure early detection of future instrument drifts.
