

From Gerald Tobias.

Dear esteemed and honorable Kristine Svinicki,

This is my third attempt to reach you.

I consider myself very close in intelligence to Isaac Newton, the renown scientist of the 1600. Of course I have not one millionth of his abilities, but in comparison to the staff at the NRC who have disregarded my previous attempts to contact you, I find my self actually very comparable.

I say this because I have found that I am the only person in the United States who knows what the radiation exposure is for a cardiac nuclear scan. Certainly none of the 23,000 cardiologists in the U.S. know, and their professors at renown universities don't know either, and sadly, their 10 million patients seen over a year's time don't know.

I was told by your staff that the NRC is not tasked with protecting public health in this regard.

I would consider working at the NRC and educate all these professionals as to the fact that a nuclear scan is not equal to one chest x-ray or equal to a small dose. It is in fact equal to 2000 to 4000 chest x-ray equivalents depending on what test are being done.

See www.medicalradiationtest.com

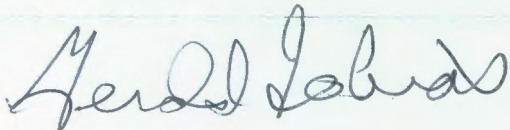

Perhaps you could find the time to contact me.
