Kevin M. Ramsey, Senior Project Manager  
Fuel Manufacturing Branch  
Division of Fuel Cycle Safety, Safeguards,  
and Environmental Review Office of NMSS  
United States Nuclear Regulatory Commission  
Washington, D.C. 20555-0001

SUBJECT: REQUEST FOR ADDITIONAL INFORMATION REGARDING TRIENNIAL UPDATE  
TO DECOMMISSIONING FUNDING PLAN (ENTERPRISE PROJECT IDENTIFIER  
L-2018-DFA-0001)

Dear Mr. Ramsey:

By letter dated May, 16, 2018, the NRC requested additional information regarding  
Framatome's Decommissioning Funding Plan (DFP) that was submitted on January 17, 2018.

The attachment to this letter provides responses to these requests.

If you have questions, please feel free to contact me at 509-375-8550 or Calvin Manning of my  
staff at 509-375-8237.

Very truly yours,

A handwritten signature in black ink that reads "T. J. Tate".

T. J. Tate, Manager  
Environmental, Health, Safety and Licensing

**After printing this label:**

1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

**Warning:** Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on [fedex.com](http://fedex.com). FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$1,000, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Attachment  
DFP RAI Responses

1. Your 2016 DFP submittal included the following key assumption. You need to retain this information (either verbatim or by reference) or explain why it no longer applies:

**Response: FRAMATOME will retain this information verbatim and has included it in the attached DFP.**

2. Your 2016 DFP contains the following line item in Table 12. The inventory disposition cost does not appear in the 2018 DFP. What is the basis for removing that cost?

Table 12 Miscellaneous Costs - Production and Production Support Facilities

No longer contains line item:

|                                |           |
|--------------------------------|-----------|
| USEC UF6 Inventory Disposition | \$756,000 |
|--------------------------------|-----------|

**Response: FRAMATOME will retain this information has included it in the attached DFP. We had 330 USEC Cylinders stored in Nov. 2015, and now have 179.**

3. Comparing Table 26 in AREVA's 2016 DFP to Table 26 in AREVA's 2018 DFP, the low-level radiological disposal rate went from to \$275.71 in 2016 to \$268.53 in 2018. What is the basis for the reduction? Additionally, line item MW- No Disposal Option \$300/ft<sup>3</sup> totaling \$434,558 in the 2016 DFP is removed from the 2018 DFP. What is the basis for removing that cost?

**Response: The low-level radiological disposal rate listed in Table 26 is largely the cost of operating our incinerator (SWUR) for volume reduction. The cost went from 275.71 to 268.53 because the cost associated with operating SWUR has decreased. The line item MW- No Disposal Option was removed because Framatome developed a unique process to separate the uranium from this waste and completed processing this waste, removed sufficient amounts of uranium from this waste so that it could be disposed of at Energy Solutions in Clive Utah. This waste has since been shipped offsite.**

4. Regarding AREVA's e-mail coming in with the 2018 DFP which covered the 8 regulatory factors, the following factors need more basis than what has been provided:

- a. "Spills—no spills that will impact decommissioning costs occurred since the last update." Additional information would help us make a finding. Have you reported any unplanned contamination events since the last update?

**Response: We have had a couple of very minor unplanned contamination events since the last update, but each was cleaned up to release limits and any contaminated soil or asphalt was packaged into waste drums and is accounted for in the DFP. (See section 5.3.2 of the DFP)**

- b. Waste inventory increases- the e-mail does not address this factor. A statement is needed regarding changes in the waste inventory since the last update and the reason for the changes (if any).

**Response:** The waste volume on is shown on the following graph. The current waste inventory as of March 31 is 13,225 ft<sup>3</sup>

- c. "Increasing waste disposal costs—the estimated cost increases listed in this update of the DFP are primarily due to increased disposal and labor costs." Additional information would help us make a finding. What factors have changed since the last update? Has the waste volume changed (if so, how much)? Have the disposal charges changed (if so, how much)? Have the labor rates changed (if so, how much)?

**Response:** The estimated disposal costs are primarily due to increased disposal and labor costs. The waste volume estimates for decommissioning is unchanged. Disposal costs estimates have changed as follows:

| Waste Category                                      | Disposal Rates, \$/ft <sup>3</sup> -2015 | Disposal Rates, \$/ft <sup>3</sup> -2017 | Comments |
|---|--|--|----------|
| LRW-Incinerate in SWUR                              | 275.71                                   | 268.53                                   |          |
| LLRW Direct disposal                                | *  | *  | *        |
| MW-Disposal at contracted mixed waste disposal site | 325.00                                   | 370.11                                   |          |

\*No incremental disposal costs above the money already allocated to US Ecology (see Table 9b).

Most key labor costs have changed. The rates used follow (note that in most cases where we found a lower labor rate in 2017, we retained the 2015 rates):

| Labor Category | Labor Rates, \$/hr- | Labor Rates, | Comments |
|----------------|---------------------|--------------|----------|
|----------------|---------------------|--------------|----------|

|  | 2015          | \$/hr -2017   |   |
|--|---------------|---------------|---|
| <b>Project Manager</b>                     | <b>119.32</b> | <b>67.96</b>  | <b>Retained 2015 rate</b>   |
| <b>Senior Engineer</b>                     | <b>99.84</b>  | <b>102.40</b> |   |
| <b>Engineer</b>                            | <b>69.78</b>  | <b>76.80</b>  |   |
| <b>Health &amp; Safety Tech (HST)</b>      | <b>42.00</b>  | <b>48.00</b>  |   |
| <b>HST Supervisor</b>                      | <b>42.00</b>  | <b>63.00</b>  | <b>HST Supervisor was not included in 2015 estimate. One HST is now assumed to be a supervisor.</b> |
| <b>Crafts (D&amp;D)</b>                    | <b>90.10</b>  | <b>93.47</b>  |   |
| <b>Equipment Operator</b>                  | <b>57.91</b>  | <b>57.66</b>  | <b>Retained 2015 rate</b>   |
| <b>Laborer</b>                             | <b>49.51</b>  | <b>53.09</b>  |   |
| <b>Clerical</b>                            | <b>36.08</b>  | <b>38.30</b>  |   |
| <b>Health Physicist</b>                    | <b>97.28</b>  | <b>111.18</b> |   |
| <b>Technician-Plant Operations Support</b> | <b>50.00</b>  | <b>53.15</b>  |   |

- d. "Facility Modifications—no facility modifications were made since the last update that will impact decommissioning costs." Additional information would help us make a finding. Has the footprint of contaminated buildings changed? Has the volume of contaminated piping, duct work, or other equipment changed significantly?

**Response: The answer to both questions is no.**

### DOCUMENT REVIEW/APPROVAL/DELETION CHECKLIST

All new and/or revised procedures shall be approved by the change author, cognizant manager(s) of areas affected by the changes, and by applicable manager(s) of any function that approved the previous revision of the document unless responsibility for such approval has been transferred to another organization. Also, the procedure shall be approved by manager(s) of functional organizations that provide technical reviews with the exception of the Training Department. Finally, Document Control shall verify that the required approvals have been properly obtained and that any documents that must be issued concurrently are ready to be issued.

Exhibit 2 - Standby Trust Agreement.....56

## 1.0 Introduction and Summary

This Decommissioning Funding Plan (DFP) is submitted by Framatome Inc. (Framatome) in compliance with 10 CFR 70.25(c) (2) and contains the information required by 10 CFR 70.25(e). Furthermore it provides the required [10 CFR 70.25(e)] triennial adjustment of the decommissioning cost estimate, last conveyed to the NRC via Version 6.0 of this plan (January 2015). The DFP was developed using the guidance provided in NUREG-1757, Volume 3, Rev. 1, "Consolidated Decommissioning Guidance".

The DFP establishes decommissioning criteria and key assumptions and outlines the major technical approaches in the decommissioning of all facilities on the Framatome Richland site with a potential for radioactive contamination. This includes the major production facilities, production support facilities, containerized waste storage areas, and contaminated environmental media (soil). Certain portions of the containerized waste storage areas manage wastes that are classified as mixed wastes, i.e., wastes that are radiologically contaminated and also contain chemical constituents that cause them to be designated as dangerous wastes under the State of Washington Dangerous Waste Regulations. The decommissioning/closure procedures and provision of financial assurance for these mixed waste areas are, therefore, intended to meet the pertinent requirements of both the NRC and the Washington State Department of Ecology (Ecology).

The DFP also provides associated decommissioning/closure cost estimates, a commitment for periodic (minimum triennial) cost estimate adjustments, and appropriate evidence of financial assurance via a Financial Assurance Instruments section. The total consolidated decommissioning/closure cost estimate addresses all required costs relative to NRC licensed materials for both the NRC and Ecology and is summarized in Table 1. The Table 1 costs are effective as of December 2017.

The major components of the cost estimate are described in Sections 5.1, Production and Production Support Facilities; 5.2, Containerized Waste Storage Pads, and 5.3, Environmental Remediation. Section 5.1 is further broken down into the major production facilities and production support (ancillary) facilities. Decommissioning the waste storage pads involves decommissioning the pad structures and disposing of the containerized mixed and low level radioactive wastes stored on the pads. Environmental remediation will entail any activities and associated costs to address any environmental contamination that will require remediation during decommissioning to meet the unrestricted use criteria of 10 CFR 20.1402.

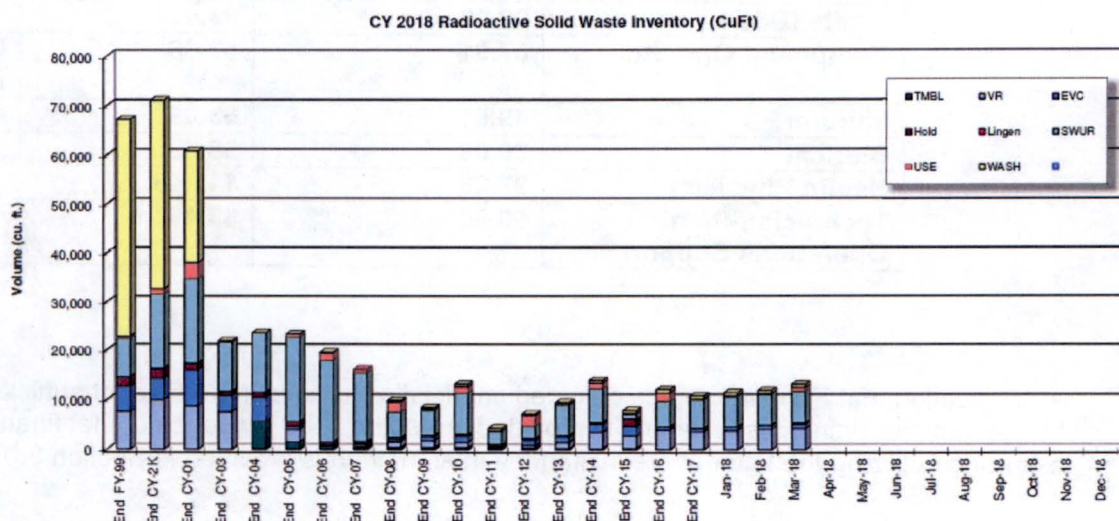

Each of the major cost estimate components is presented via a set of tables, as similar as practicable to those in NUREG-1757, which support the estimates. In some cases, e.g., dispositioning of the containerized waste inventories, the NUREG-1757 tables are not easily applied; in those cases alternate or modified tables better suited to communicate the pertinent cost data have been used.

Some key items to note since the 2015 DFP update are:

- There have not been any changes in the authorized possession limit.
- No spills that will impact decommissioning costs have occurred. The few very minor unplanned contamination events since the last update have been cleaned up to release limits and any contaminated soil or asphalt was packaged into waste drums and is accounted for in section 5.3.2.
- The volume of contaminated piping, duct work and other equipment has not changed significantly since 2015. The foot print of contaminated buildings has not changed.

- No onsite disposal has occurred.
- No use of settling ponds has occurred since the last update.
- No actual remediation costs have occurred since the last update.
- The total estimated cost of decommissioning has increased by \$3,845,604 to \$66,435,800.
- The inventory of USEC cylinders stored on site has decreased from 330 in November of 2015 to 179 in March of 2018.
- The cost of disposal of low-level radiological waste processed through the Framatome incinerator has been reduced from \$276/ft<sup>3</sup> to \$269/ft<sup>3</sup>. This decrease is largely due to decreased costs in operating the incinerator.
- The \$434,558 line item in Table 26 was removed because Framatome developed a unique process to separate most of the uranium from this waste and has completed processing this waste and has disposed of it at a commercial disposal site.
- There has been little change in the inventory of waste volume since 2015 as shown in the following figure.

- The estimated disposal costs are primarily due to increased disposal and labor costs. The waste volume estimates for decommissioning is unchanged. Disposal costs estimates have changed as follows:

| Waste Category                        | Disposal Rates, \$/ft <sup>3</sup> -2015 | Disposal Rates, \$/ft <sup>3</sup> -2017 | Comments |
|---------------------------------------|--|--|----------|
| LRW-Incinerate in SWUR                | 275.71                                   | 268.53                                   |          |
| LLRW Direct disposal                  | *  | *  | *        |
| MW-Disposal at contracted mixed waste | 325.00                                   | 370.11                                   |          |

**disposal site**

\*No incremental disposal costs above the money already allocated to US Ecology (see Table 9b).

- Most key labor costs have changed. The rates used follow (note that in most cases where we found a lower labor rate in 2017, we retained the 2015 rates):

| Labor Category                      | Labor Rates, \$/hr-2015 | Labor Rates, \$/hr -2017 | Comments   |
|-------------------------------------|-------------------------|--------------------------|--|
| Project Manager                     | 119.32                  | 67.96                    | Retained 2015 rate   |
| Senior Engineer                     | 99.84                   | 102.40                   |  |
| Engineer                            | 69.78                   | 76.80                    |  |
| Health & Safety Tech (HST)          | 42.00                   | 48.00                    |  |
| HST Supervisor                      | 42.00                   | 63.00                    | HST Supervisor was not included in 2015 estimate. One HST is now assumed to be a supervisor. |
| Crafts (D&D)                        | 90.10                   | 93.47                    |  |
| Equipment Operator                  | 57.91                   | 57.66                    | Retained 2015 rate   |
| Laborer                             | 49.51                   | 53.09                    |  |
| Clerical                            | 36.08                   | 38.30                    |  |
| Health Physicist                    | 97.28                   | 111.18                   |  |
| Technician-Plant Operations Support | 50.00                   | 53.15                    |  |

A certification that Framatome has obtained financial assurance in an amount sufficient to meet the decommissioning cost estimate is provided in Section 7.0. Evidence of that financial assurance utilizing the letter of credit/standby trust method is provided in Section 8.0.

Table 1 Decommissioning Cost Estimate Summary

| Category   | Cost Estimate, \$ |
|--|-------------------|
| 1. Production and Production Support Facilities (Table 13) | 48,033,688        |
| 2. Containerized Waste Storage Pads and Inventories        |                   |
| A. Storage Area (Pad) Structures (Table 25)                | 69,757            |
| B. LLRW Inventory Disposal (Table 26)                      | 2,924,292         |
| C. Mixed Waste Inventory Disposal (Table 26)               | 592,176           |
| 3. Environmental Remediation                               |                   |
| A. Legacy Surface Impoundment Area (Table 30)              | 265,885           |
| B. Historic Spills/Releases (Table 34)                     | 14,110            |

| Subtotal   | 53,140,640        |
| 25% Contingency  | 13,285,160        |
| TOTAL  | 66,425,800        |

## 2.0 Decommissioning Criteria

This DFP and associated decommissioning cost estimate for Framatome's Richland Facility, located at 2101 Horn Rapids Road, Richland, Washington (License SNM-1227, Docket 70-1257) have been prepared per the requirements of 10 CFR 70.25 and guidance provided in NUREG-1757, "Consolidated NMSS Decommissioning Guidance, Volume 3", Rev. 1, February 2012.

### 2.1 *Uncontaminated Facilities*

The disposition of uncontaminated equipment and facilities is not within the scope of this plan, provided that such facilities are verified to be uncontaminated in accordance with approved radiation survey procedures.

### 2.2 *Residual Radiation Levels*

In accordance with 10 CFR 20.1402, the residual radioactive contamination distinguishable from background radiation for the decontaminated Richland facility shall result in dose levels of less than 25 mrem/yr to the average member of the critical group. Any equipment or facility which cannot be decontaminated to acceptable levels will be demolished, packaged, and disposed of at a licensed low-level radioactive waste (LLRW) or mixed waste disposal site, or alternatively, could be transferred to another licensed facility. Residual environmental contamination will be remediated to levels consistent with the 25 mrem/yr unrestricted use criterion.

### 2.3 *Records*

Records of the decommissioning procedures and results will be preserved for at least five years, or as required by then-current regulations.

### 2.4 *Financial Provisions*

Decommissioning of the Framatome Richland facility will be conducted at no cost to the public. Framatome's provisions for funding of the decommissioning activities are provided in Section 7.0 of this plan.

## 3.0 Key Assumptions

The following key assumptions were used in the preparation of the DFP and cost estimate for the decommissioning of the licensed facilities at Framatome's Richland Facility.

1. This DFP assumes the availability of LLRW and mixed waste disposal facilities at reasonable cost and the application of packaging and transportation requirements consistent with existing regulations.
2. Prior to the start of final site decommissioning, a detailed decommissioning plan consistent with NRC guidance, including a proposed closeout survey plan, will be submitted to the NRC for approval. The results of the closeout survey shall be approved by the NRC prior to release of equipment or grounds to unrestricted use.
3. All work will be performed in compliance with procedures written specifically for the decommissioning activity in conjunction with the detailed decommissioning plan.
4. All work inside contaminated areas will be performed using approved radiation work procedures.

5. The typical costs associated with decontamination of process equipment and ventilation ductwork for free release are expected to be greater than their salvage value, as well as in excess of the cost savings realized by disposal at a non-radioactive waste disposal site. In general, therefore, no attempt at decontamination for this purpose will be made except in special cases when it may be warranted. Contaminated process equipment and ductwork along with other decommissioning-related wastes will typically be disposed of by burial in LLRW disposal sites, and only the facility will be decontaminated.
6. The facilities themselves, i.e., the buildings housing activities utilizing licensed materials, will be decontaminated via a combination of physical processes (steamcleaning, sandblasting, scarification, etc.) such that their demolition will not be required to meet the 25 mrem unrestricted use criteria.
7. All LLRW generated in the decontamination and/or dismantling of site facilities will be containerized and staged to allow shipment to the U.S. Ecology-operated Northwest Compact LLRW Disposal Site over a two calendar year period. The site operator is limited to a maximum allowable total revenue collection from all facility users over a one year period; this limit is currently at \$6.230M as set by the Washington Utilities and Transportation Commission. The disposal cost estimate [(see Table 9b)] conservatively assumes application of the entire disposal site fee for the two year period to Framatome.
8. The cost estimate does not take credit for any salvage value that may be realized from the sale of potential assets (e.g., recovered materials or decontaminated equipment) during or after decommissioning.
9. The cost estimate does not take credit for reduced taxes that might result from payment of decommissioning costs or site control and maintenance costs.
10. The site's stored inventory of uranium hexafluoride ( $UF_6$ ) in Model 30-B cylinders falls into three categories, (1) a relatively small number of cylinders owned by Framatome as working stock, (2) cylinders of  $UF_6$  owned by Framatome's utility customers and staged for utilization in manufacturing customer reactor reload fuel, and (3)  $UF_6$  cylinders stored on a temporary basis in behalf of the United States Enrichment Corporation (USEC). Richland's primary plan assumes that the entire  $UF_6$  inventory will be dispositioned prior to the initiation of the decommissioning process, i.e. either processed into and delivered as product to Framatome's customers or transferred offsite to locations consistent with the ownership of the  $UF_6$ . As such, assuming routine facility conditions leading into the decommissioning stage, the site's  $UF_6$  inventory will not constitute a decommissioning liability.  $UF_6$ -related assumptions considering an unanticipated non-routine shutdown scenario are as follows:
  - o Framatome-owned working stock. This relatively small number of cylinders (typically  $\leq 15$ ) will be dispositioned offsite to a European Framatome-affiliate fuel fabricator under an existing long-term NRC export license. If necessary, the costs of this inventory transfer will be borne by the Framatome recipient as an Framatome action to retain full usage of this Framatome-owned asset.
  - o Framatome customer-owned  $UF_6$ . Under the unlikely scenario of Framatome inability to pay for transfer costs, the primary assumption is that customers will reclaim their  $UF_6$  at their expense as a practical action to retain control and usage of their valuable business asset. However Framatome's business interruption plan and associated property insurance will provide financial coverage for inventory removal/transfer activities if such activities are necessitated by covered events (fire, lightning, aircraft, explosions, earthquake, windstorm, theft, equipment failure, terrorism, etc.)
  - o Consistent with contract language, in the event of a unilateral Framatome decision to terminate storage of cylinders stored in behalf of USEC, the cylinders will be transferred

to an alternate location of USEC's choice at Framatome expense. Based on a conservative assumption that the entire transfer cannot be accomplished promptly in the case of a sudden shutdown scenario, these costs are assumed to be covered from decommissioning reserves. In recognition that the stored USEC-related inventory is an extraordinary one-time occurrence related to the shutdown of that facility, the cost estimate uses a cylinder inventory total equal to 50% of the peak inventory (currently being approached as of June 2016). Costs based on currently contracted carrier and labor rates are reflected in Table 12. Miscellaneous Costs, of this DFP.

11. Non-UF<sub>6</sub> inventory of licensed material, i.e. powder pellets, fuel rods, and fuel assemblies, are anticipated to be dispositioned to customers and/or Framatome affiliates prior to initiation of the decommissioning process. In the unlikely event of a sudden plant closure, it is assumed that the material can be rapidly dispositioned within a 30-60 day timeframe.
12. For the sake of this DFP and associated cost estimate, the limit for free release of materials, e.g., soil, in which the radioactive contamination is distributed throughout the material matrix, is assumed to be 30 pCi/gram.
13. The DFP assumes that the site and associated facilities will be decommissioned via decontamination activities and materials removal/disposal in a manner that will not necessitate stabilization and long-term surveillance programs.
14. Increases in plant processing throughput, associated and not associated with increases in site possession limits, are not assumed to increase plant decommissioning liability unless they result in increases in contaminated facilities, equipment, or environmental media. Concurrent increases in generation of operational wastes also are not assumed to necessarily increase decommissioning liability in that estimate waste disposal costs are based on maximum expected waste accumulation (see Sections 5.2.2, 5.2.3, and Table 26). Maximum expected waste accumulations are based on plant history and are updated as appropriate.

#### 4.0 Facility Description Summary

This section provides a facility description as called for in the Facility Description section of Volume 3, Rev. 1, of NUREG-1757. The information supplements the facility description on record (Docket 70-1257) as part of Framatome's NRC special nuclear materials license (SNM-1227) for the Richland site.

##### 4.1 NRC License

The Framatome Richland nuclear fuel fabrication facility is operated in accordance with an NRC special materials license issued under 10 CFR Part 70. The license, SNM-1227, is docketed under NRC Docket No. 70-1257 for the Richland site.

##### 4.2 Authorized Radioactive Materials

NRC License SNM-1227 authorizes Framatome to possess U-235 present in uranium enriched up to 5 wt. % U-235; and a small amount of U-235 may be possessed in uranium U-235 enrichments exceeding 5 wt. %. In addition to this NRC license, Framatome has a Radioactive Materials license with the State of Washington, WN-I062-1. The disposal costs associated with the material authorized in this license, other than the sealed sources, is included in this Decommissioning Funding Plan.

#### 4.3 *Usage of Licensed Materials*

The Framatome Richland nuclear fuel fabrication facility utilizes enriched uranium ( $\leq 5$  wt. % U-235) for the production of enriched uranium nuclear fuel for use in commercial light water reactors, both domestically and internationally. Finished fuel assemblies (bundles) are supplied to nuclear utilities for direct usage as fuel in their nuclear power reactors; however intermediate products such as enriched uranium powder or pellets are also produced on behalf of other nuclear fuel cycle facilities.

The typical feed material to the plant is uranium hexafluoride ( $UF_6$ ) received in 30-inch diameter steel cylinders, each containing approximately 1500 kilograms of enriched uranium. Some feed material is Urania or UN solutions received in licensed shipping packages which are unloaded and eventually processed through the appropriate process stream(s). The  $UF_6$ , UN, and Urania are chemically converted to ceramic grade uranium dioxide ( $UO_2$ ) powder. The resultant powders pressed into fuel pellets, which are then sintered and subsequently loaded into fuel rods. These loaded fuel rods, in conjunction with other supporting hardware (tie plates and grid spacers), are assembled into a variety of fuel bundle designs, depending on customer-specific requirements. The fuel products - powder, pellets, or fuel bundles (assemblies) - are loaded for shipment into specially designed shipping containers licensed by the NRC and/or the U.S. Department of Transportation.

#### 4.4 *Description of Facilities Utilizing Special Nuclear Material*

The Framatome Richland nuclear fuel fabrication plant is located at 2101 Horn Rapids Road just within the northern limits of the City of Richland in Benton County, Washington. More specifically, the facility is located in the approximate center of the more easterly of two adjacent quarter sections (160 acres each) of land owned by Framatome. All facilities storing or processing special nuclear material are located within an approximately 53 acre fenced, secured area; the remainder of the surrounding Framatome property is either devoted to vehicle parking areas, is undeveloped, or is leased for agricultural usage.

The primary production activities involving special nuclear material and state licensed material are conducted in three major facilities - the Dry Conversion Facility; the Uranium Dioxide ( $UO_2$ ) Building, which includes the Blended Low-Enriched Uranium (BLEU) addition; and the Specialty Fuels (SF) Building. The specific functions of these facilities, the general approach to their decommissioning, and the associated decommissioning cost tables are provided in Section 5.1, Production and Production Support Facilities, of this DFP.

The primary production facilities are supported by a number of ancillary support facilities that also entail the storage or handling of SNM or SNM-containing materials. These facilities are most typically involved with materials storage (feed materials, product intermediates, or finished product) or waste processing functions but also provide a number of other miscellaneous production support functions, e.g., purification of contaminated fuel scrap, laundering of contaminated clothing, and recertification of  $UF_6$  shipping cylinders. A listing of these facilities and their functions, the general assumptions/approach pertinent to their decommissioning, and the associated decommissioning cost tables are also provided in Section 5.1 of this DFP.

The major containerized solid waste storage pads consist of two asphalted areas managing currently generated and legacy containerized (barreled or boxed) wastes. These facilities are distinguished by their large spatial size and the fact that they may manage mixed wastes, i.e., wastes that are both radiologically contaminated and chemically hazardous. These facilities are therefore simultaneously subject to the decommissioning requirements of the NRC and, for those portions managing chemically hazardous wastes, the closure requirements of the

Washington State Department of Ecology. The inventory disposition and closure approach pertinent to the containerized waste pads are addressed in Section 5.2 of this DFP.

In addition to the facilities themselves as discussed above, operation of the site offers the potential for contamination of the land (soil) below and/or around those facilities. That contamination may have resulted from releases from the facilities or from releases/spills associated with the transfer of licensed materials between facilities, e.g., piping leaks, container spills, etc.

The most significant area of known soil contamination on the Framatome Richland site was the area associated with operation of the legacy surface impoundment system. Known liquid releases from at least three of the six impoundments in the 1970s - early 1980s resulted in contamination of the soils underlying these units with uranium as well as certain chemicals (fluorides, nitrates, ammonia). The surface impoundment system has been removed and associated radiological and non-radiological soil contamination remediated to meet Washington Department of Ecology (Ecology) soil cleanup levels for uranium and regulated chemical constituents. Additional soil remediation to meet NRC radiological decommissioning criteria is not anticipated to be necessary.

Less significant instances of soil contamination with licensed materials have occurred from documented spills/releases over the course of the plant's operating history. These contamination incidents have typically been small and remediated at the time of occurrence but in some cases the potential for residual contamination (detected or undetected) remains. These areas are documented in decommissioning records maintained by Framatome in accordance with 10 CFR 70.25(g).

Also addressed are two potential soil contamination areas that have not been characterized but that may, based on operating history, impose soil contamination levels requiring remediation. The two areas are the soil underlying current and historic wet chemical processing areas within the UO<sub>2</sub> Building and soil underlying current and historic underground piping carrying uranium-bearing solutions.

Decommissioning obligations and associated costs relative to environmental remediation are discussed in Section 5.3. These include residual decommissioning-related final survey costs associated with the remediated surface impoundment area, potential characterization/remediation costs associated with certain spills/releases documented in required decommissioning records, and estimated characterization/remediation costs postulated for the two uncharacterized potential soil contamination areas discussed above.

#### 4.5 *Pre-Shipment/Disposal Waste Accumulations*

With the elimination of the site's historic surface impoundment system, current liquid waste processing is very closely coupled to production, using relatively small volume tanks. Temporary accumulation of liquid SNM-containing wastes from production activities is very limited with respect to time and volume and an insignificant contributor to the overall plant decommissioning liability.

Current inventories of containerized solid wastes (low-level radioactive and mixed) and their associated disposition costs are provided in Table 26. Based on the site's continued progress in working down its legacy backlog of stored wastes, current inventories are no longer necessarily higher than possible maximum foreseeable inventories in the future. Therefore in addition to current inventories, Table 26 provides estimates of maximum anticipated volumes in each solid waste category. These higher inventory volumes have been conservatively utilized to estimate disposal cost liabilities.

Accumulated volumes of low-level radioactive waste (LLRW) generated by the actual decommissioning activities will be dispositioned to LLRW disposal and/or recycle facilities. These waste volumes are presented in Table 9. Disposal volumes related to postulated environmental remediation activities are included in Table 40. As noted in Section 3.0, Key Assumptions, No. 7, the waste volumes set forth in Tables 9 and 40 will be containerized and staged over the course of the decommissioning/remediation activities and then all shipped to the LLRW disposal site over a two year period.

## 5.0 Closure Procedures and Cost Estimates

This section outlines the major technical approaches involved in the decontamination and decommissioning of each major facility with a significant potential for radiological contamination. In the case of the containerized waste storage areas, the DFP also extends to the onsite waste inventory associated with these units. Minor ancillary facilities such as external docks, grounds, and warehouses, where contamination is not anticipated but may be found, will be decontaminated in a similar fashion as the known-contaminated facilities described herein.

Certain portions of the containerized waste storage areas may manage mixed wastes, i.e., wastes that are radiologically contaminated and also contain chemical constituents that cause them to be designated as dangerous wastes under the State of Washington Dangerous Waste Regulations. These wastes are dually regulated by the NRC and Ecology and the units are subject to the decommissioning requirements of the NRC (10 CFR 70.25) and the closure requirements of Ecology (WAC 173-303-610 and 650). Detailed decommissioning procedures written pursuant to this DFP and closure plans/procedures developed pursuant to Ecology's regulations will jointly address the requirements of both regulatory agencies with respect to the mixed waste areas.

Environmental remediation costs apart from costs associated with the decommissioning of site structures are not anticipated to be significant by comparison. Environmental remediation-related approaches and costs are discussed in Section 5.3.

### 5.1 *Production and Production Support Facilities*

The production activities at the Framatome Richland facility encompass the full scale of nuclear fuel fabrication, i.e., chemical conversion of  $UF_6$  to  $UO_2$  powder,  $UO_2$  pellet production, rod loading, and fuel bundle assembly. These activities occur in three major production facilities, namely the Dry Conversion Facility; the  $UO_2$  Building, including the Blended Low Enriched Uranium (BLEU) addition; and the Specialty Fuels Building. The major production activities are supported by a number of production support, or ancillary, facilities. The general approach to decommissioning these facilities, along with the associated costs, is described below. The associated cost estimates are shown in Tables 2 through 13.

#### 5.1.1 Dry Conversion Facility

The Dry Conversion Facility (DCF) houses the head-end processes for the Richland plant's nuclear fuel fabrication activities, namely the vaporization of  $UF_6$  out of Model 30-B cylinders using electrically-heated autoclaves, the conversion of the  $UF_6$  vapor to dry  $UO_2$  powder in fluidized bed reactors, final defluoridation of the powder in calciners, and the physical preparation (milling, compacting, etc.) of the powder for subsequent pellet pressing. Major aspects of the decommissioning of the DCF are as follows:

1. All process equipment in the various contaminated areas of the building will be surveyed to determine the degree of contamination. Equipment with contamination which is below acceptable release levels can be disposed of on a commercial basis at non-radiological

disposal facilities. Equipment which is contaminated to levels above such release levels will be decontaminated if warranted, and packaged for shipment. Such equipment contaminated above free release levels will be shipped to an appropriate low-level radioactive waste disposal site or alternatively, could be transferred to another licensed facility.

Liquid effluent systems exiting radiation zones will be treated in the same manner as process equipment in the contaminated areas.

Sufficient radiation surveys of process equipment outside the contaminated areas will be made to assure that unacceptable levels of contamination have not spread outside the contaminated operating areas. Non-contaminated process equipment outside the contaminated areas can be disposed of on a commercial basis at non-radiological disposal facilities or can be left in place to support the mission of associated decontaminated facilities.

2. All contaminated exhaust ductwork will be treated in a manner similar to the contaminated process equipment as described in item 1 above. The final filter bank of the ventilation system will also be disposed of by burial.
3. After removal of all process equipment, ancillary equipment, and exhaust ducting, the facility ceiling and walls will be cleaned as necessary. The cost estimate for this work is based on sandblasting. The typical wall materials (painted concrete and painted cement block) and ceiling materials (metal panels) are amenable to coating removal and decontamination via sandblasting. Porous, non-durable wall coverings such as gypsum wallboard are uncommon and are present in noteworthy quantities only within two production facilities (UO<sub>2</sub> and Specialty Fuels Buildings) and a single production support facility (ELO Building). The total packed disposal volume for the potentially radioactively contaminated portion of this material is relatively small ( $\approx 2,500 \text{ ft}^3$ ) and is included in the packed disposal volumes provided in Table 2.
4. The floors of the controlled areas will be stripped of all protective coatings and appropriately cleaned. Solvents, if used, will be selected such that they will not cause materials to be designated as dangerous wastes under the State of Washington Dangerous Waste Regulations. The cost estimates for floor decontamination assume the utilization of mechanical scarification. Due to the fact that the floors are in most cases coated with some type of sealant, less aggressive surface decontamination techniques may suffice for large areas of the facility, making scarification a conservative assumption.
5. A radiation survey described in the decommissioning plan will be completed to verify that areas are successfully decontaminated.
6. After NRC approval of the radiation survey results, the entire affected area may be resurfaced as appropriate.

#### 5.1.2 UO<sub>2</sub> Building

The UO<sub>2</sub> Building houses the majority of Framatome's nuclear fuel fabrication process downstream of the Dry Conversion Facility, i.e., pellet pressing to final fuel bundle assembly. The building also houses the Richland plant's one remaining "wet" chemical conversion (ammonium diuranate) production line, now utilized strictly for uranium scrap recovery. The activities (excluding the ADU conversion-related activities) are broadly grouped into two categories as follows:

- Ceramics, including additive blending, pellet pressing, pellet sintering, pellet grinding and pellet inspection; and

- Rod Fabrication/Bundle Assembly, including rod loading; rod welding, leak checking, assaying, and x-raying; rod inspection; bundle assembly; and bundle inspection, cleaning, and packaging.

These ceramics and rod fabrication/bundle assembly activities include those performed in the traditional portions of the  $\text{UO}_2$  Building as well as those more recently added (2004) to accommodate processing of BLEU material.

Other miscellaneous support facilities located within the  $\text{UO}_2$  Building include the  $\text{U}_3\text{O}_8$  Facility, Powder Storage Facility, Powder Dissolution Facility, Pellet Dissolution Facility, Miscellaneous Uranium Recovery (MURS) Facility, Powder Characterization Facility,  $\text{UF}_6$  cylinder wash facility, Quality Control Analytical/Testing Laboratories, Waste Volume Reduction Facility (VRF), and "hot" maintenance facilities.

Decontamination and decommissioning of the  $\text{UO}_2$  Building will be accomplished via an approach consistent with that described for the Dry Conversion Facility with one exception. The cost estimate includes enhanced approaches to address potential floor contamination in historic and current wet chemical processing areas, including deeper floor scarification or concrete removal.

#### 5.1.3 Specialty Fuels Building

The Specialty Fuels (SF) Building houses fuel fabrication activities related to the production of fuel containing gadolinia ( $\text{Gd}_2\text{O}_3$ ) as a neutron poison. The activities include the blending of  $\text{UO}_2$  powder, produced in the Dry Conversion Facility or  $\text{UO}_2$  Building, with purchased  $\text{Gd}_2\text{O}_3$ ; powder preparation and additive blending; pellet pressing; pellet sintering; and pellet grinding. Loading of gadolinia-containing pellets into rods occurs in the  $\text{UO}_2$  Building. Also located in the SF Building is the Solid Waste Uranium Recovery (SWUR) Incinerator Facility.

Decontamination and decommissioning of the SF Building will be accomplished via an approach consistent with that described for the Dry Conversion Facility and  $\text{UO}_2$  Building.

#### 5.1.4 Production Support (Ancillary) Facilities

In addition to the Dry Conversion Facility and the  $\text{UO}_2$  and SF Buildings, a number of other facilities are involved with enriched uranium handling and processing in varying degrees, and will, therefore, require decontamination/decommissioning efforts commensurate with those activities. The facilities, along with a brief summary of their associated enriched uranium/radionuclide-handling activities, are as follows:

1. Engineering Laboratory Operations (ELO) Building - process development laboratories, Gadolinia Scrap Uranium Recovery (GSUR) Facility (fuel scrap dissolution and solvent extraction activities), decontamination area, and hot maintenance area.
2. Contaminated Clothing Laundry - laundering of contaminated protective clothing.
3. Fuels Storage Warehouse (Warehouse 4) - storage of packaged special nuclear material in various compounds and forms.
4. UNH Drum Storage Warehouse - storage of closed drums of uranyl nitrate liquid awaiting processing.
5. Uranium Storage Warehouse (Warehouse 6) - past storage of packaged special nuclear material in various compounds and forms; currently devoted to non-SNM processing/storage activities.
6. Operations Scrap Warehouse (Warehouse 7) - storage of closed containers of uranium-containing feed materials, product, or scrap awaiting processing.

7. Product Development Test Facility (PDTF) - LOCA heat transfer, seismic, and coolant flow testing of nuclear fuel assemblies.
8. UF<sub>6</sub> Receiving and Storage Facility - receipt and storage of UF<sub>6</sub> cylinders.
9. Lagoon Uranium Recovery (LUR) Facility - past recovery of uranium from liquid process wastes; no current SNM-related activities.
10. Solids Processing Facility (SPF) - an addition to LUR containing equipment for recovery of uranium from contaminated sludges.
11. Silicon Removal Process (SRP) - equipment housed at LUR/SPF to remove silicon from low-U liquid effluents before treatment in the Ammonia Recovery Facility.
12. Modular Extraction Recovery Facility (MERF) - recovery of uranium from certain solid phase low-level radioactive and mixed wastes.
13. Wastewater Treatment Facility - includes the traditional Ammonia Recovery Facility (ARF) for the recovery of ammonium hydroxide from high-ammonia-content liquid process wastes; the filtration and ion exchange (IX) systems for removal of trace levels of uranium from the plant's final sewered effluent, including equipment to flush and regenerate these systems; and wastewater tanks for interim management of the site's contaminated liquid effluents.
14. Fuel Services Facility (Building 9) - disassembly of contaminated fuel bundles; waste handling/packaging activities; miscellaneous production-support activities.
15. Cylinder Recertification Facility (CRF) - testing and recertification of UF<sub>6</sub> cylinders.
16. Warehouse 2 - storage/loading of packaged special nuclear material in various compounds and forms.
17. Uranyl Nitrate Building (UNB) - receipt of uranyl nitrate (UN) solution from offsite sources (download from shipping containers) and onsite sources (pipeline transfer) with subsequent storage of the UN in tanks while awaiting transfer to the UO<sub>2</sub> Building for conversion to UO<sub>2</sub>.

The same basic plan as outlined above for the major production facilities will be implemented, as necessary, in the decontamination and decommissioning of these ancillary facilities.

Assumptions specific to ancillary facilities are as follows:

1. The following facilities contain contaminated equipment to be disposed of and, based on the nature of their operations, will likely require decontamination of the facility and supporting structures prior to release.
  - ELO (process areas)
  - LUR/SPF/SRP
  - MERF
  - Fuel Services Building (Building 9) process area
  - WWTF (ARF process sump areas only)
  - Laundry
2. The following facilities contain contaminated equipment to be disposed of, but no significant contamination of the facilities themselves is anticipated because the radioactive material was well contained in equipment or in closed containers:
  - WWTF (exclusive of ARF process sump areas)

- Cylinder Recertification Facility
  - Uranyl Nitrate Building
3. The following facilities contain neither contaminated equipment requiring disposal nor significant levels of structural contamination because they contain, or previously contained, radioactive material exclusively in closed containers.
- Operations Scrap Warehouse (Warehouse 7)
  - UNH Drum Storage Warehouse
  - Boron Pellet Production Facility (a.k.a. Warehouse 6, this building was formerly used for Uranium Oxide Storage in inner shipping packages, 5-gallon buckets and 45-gallon powder storage drums.)
  - PDTF
  - Fuels Storage Warehouse (Warehouse 4)
  - UF<sub>6</sub> Receiving and Storage Facility
  - Warehouse 2

Table 5 Final Radiation Survey - Production and Production Support Facilities (Work Days)

Estimate of the number of work days, by specific labor category that will be required to conduct a final radiation survey.

| Activity     | Health and Safety Technician Work Days |
|--------------|--|
| Final Survey | 628                                    |
| TOTAL        | 628                                    |

Table 6 Total Work Days by Labor Category - Production and Production Support Facilities

Total work days estimated for each specific labor category from the applicable tables above (i.e., from Tables 3 through 5) plus total work days associated with overall project support functions (non-task-specific).

[illegible]

Table 7 Worker Unit Cost Schedule

Fully burdened billing rates (wages, benefits, overheads, and profits) from State of Washington-based third party contractors (with exception of NRC).

| Labor Category                        | Labor Rate, \$/hr. | Labor Rate, \$/day* |
|---------------------------------------|--------------------|---------------------|
| Project Manager                       | 119.32             | 955                 |
| Senior Engineer                       | 102.40             | 819                 |
| Engineer                              | 76.80              | 614                 |
| Health and Safety Technician (HST)    | 48.00              | 384                 |
| Health Physicist                      | 111.18             | 889                 |
| Safety Engineer                       | 72.40              | 580                 |
| Crafts (D&D)                          | 93.47              | 748                 |
| Crafts – Plant Operations Support     | 88.92              | 711                 |
| Equipment Operator                    | 57.91              | 463                 |
| Laborer                               | 53.09              | 425                 |
| Technician – Plant Operations Support | 53.15              | 425                 |
| Clerical                              | 38.30              | 306                 |
| NRC                                   | 279.00             | 2,232               |

\* Eight hour day; rounded to the nearest dollar.

Table 8 Total Labor Costs by Major Decommissioning Task - Production and Production Support Facilities

Estimated work days for each specific labor category (from Table 6) multiplied by the total cost per work day for the corresponding labor category (from Table 7). Costs for Craft Support – Plant Operations and Technician Support – Plant Operations based on full time equivalent staffing (FTE) as indicated and composite labor rates reflecting staffing mix.

| Task  | Project Manager Cost, \$ | Safety Engineer Cost, \$ | Senior Engineer Cost, \$ | Engineer Cost, \$ | Health and Safety Tech. Cost, \$ | Health Physicist Cost, \$ | Clerical Cost, \$ | Crafts (Avg.) Cost, \$ | Laborer Cost, \$ | Technician Plant Support, Cost \$ | NRC Cost, \$ | Total Labor Cost, \$ |
|---|--------------------------|--------------------------|--------------------------|-------------------|----------------------------------|---------------------------|-------------------|------------------------|------------------|-----------------------------------|--------------|----------------------|
| Planning and Preparation  |                          | 126,222                  |                          | 54,067            | 192,768                          |                           |                   | 29,910                 | 16,989           |                                   | 55,860       | 475,816              |

| TOTAL - Production and Production Support Facilities  | 48,812,368 |

## 5.2 *Containerized Waste Storage Pads and Inventories*

Containerized (barreled or boxed) operational wastes are managed on an ongoing basis at two significant container storage areas at the Richland facility - an uncovered asphalt pad located in the central portion of the site, often referred to as the "old" or "historic" dangerous waste storage pad; and a newer, partially covered asphalt pad, located in the southeast corner of the site, and referred to as the Dangerous Waste Storage Facility (DWSF). Both pads manage containerized low-level radioactive waste (LLRW) and also manage, or have managed, LLRW that also designates as chemically dangerous per Ecology's Dangerous Waste Regulations (WAC 173-303), i.e., mixed wastes. As such, these waste management units, all or in part, are subject to both the NRC's decommissioning requirements and Ecology's closure requirements, as well as the financial assurance requirements of both agencies.

The decommissioning/closure of the containerized waste storage pads will involve disposition of the containerized inventories followed by decommissioning/closure of the physical structures. Current plans call for utilization of both pads for the management of LLRW until time of plant closure, meaning that NRC decommissioning will not occur before then. With respect to mixed waste management, nearly all of the historic dangerous waste pad has been closed per Ecology regulations now that Framatome has completed its disposition of the large volume of legacy containerized mixed wastes once stored on the historic pad. Management of LLRW and mixed wastes on the newer DWSF will continue until time of plant closure, at which time Framatome will pursue Ecology closure of the DWSF plus the small unclosed portion of the historic pad. At that time, decommissioning of both pads will also be pursued per NRC requirements.

### 5.2.1 Container Storage Pad Structures

Physical structures associated with the container storage pads (historic pad and DWSF) consist of the blacktop pads at both locations, a limited number of double containment storage pallets, and the roofed three-sided storage building at the DWSF. Contamination levels (radiological or chemical) are expected to be minimal at both locations based on the fact that the pads manage for the most part solid phase wastes in securely closed strong-tight containers. Outside surfaces of the containers have undergone appropriate radiological release surveys. Furthermore, the containers are subject to routine operational inspections. The need for remediation of surrounding or underlying soil to any significant extent is also not anticipated but soil status will be verified via appropriate screening/sampling protocols. Prior (September 2004) closure of a significant portion of the historic waste pad under Ecology regulations confirmed the lack of surface and soil contamination associated with this longstanding operation.

Major aspects of the decommissioning/closure of the container storage pads and associated equipment/facilities are as follows:

- radiological surface screening measurements at a detection sensitivity sufficient to detect past releases from containers to the blacktop or surrounding peripheral soils;
- removal of any asphalt with evidence of radiological contamination to allow similar screening of underlying soil;
- chemical constituent sampling of any underlying or peripheral soils found to be radiologically contaminated;
- removal/disposal of contaminated blacktop and/or soils in accordance with NRC/Ecology cleanup criteria;
- surveying/decontamination/release of double containment pallets, and;
- replacement of removed asphalt with non-contaminated material.

Final release of the pad structures will be subject to the final release survey requirements of both the NRC and Ecology. Costs associated with closure/decommissioning of the waste storage pad structures are summarized in Tables 14-25.

Table 14 Number and Dimensions of Facility Components - Storage Areas

Name of room, laboratory, or area: Outdoor Containerized Waste Storage Areas

| Component                  | Number of Components | Dimensions of Components | Total Dimensions, ft <sup>2</sup> |
|----------------------------|----------------------|--------------------------|-----------------------------------|
| Asphalt Pad - Old          | 1                    | 72' x 133' + 45' x 169'  | 17,181                            |
| Asphalt Pad - DWSF         | 1                    | 120' x 170'              | 20,400                            |
| Double Containment Pallets | 20                   | 4' x 4'                  | 320                               |

Table 15 Planning and Preparation - Storage Areas (Work Days)

Estimate of the number of work days, by specific labor category, that will be required to complete planning and preparation activities.

| Activity   | Safety Engineer Work Days | Engineer Work Days | Health and Safety Technician Work Days | Laborer Work Days |
|--|---------------------------|--------------------|--|-------------------|
| Preparation and Submittal of Documentation for Regulatory Agencies   | *                         |                    |  |                   |
| Submittal of Decommissioning Plan to NRC when required by 10 CFR 30.36(g)(1), 40.42(g)(1), or 70.38(g)(1)  | *                         |                    |  |                   |
| Development of Work Plans/Safety Plans   | 2                         |                    |  |                   |
| Procurement of Special Equipment   |                           | 2                  |  |                   |
| Staff Training   | 1                         |                    | 1                                      | 1                 |
| Characterization of Radiological Condition of the Facility (including sampling, soil and tailings analysis, or groundwater analysis if applicable) |                           | 4                  | 10                                     | 4                 |
| Other (specify)  |                           |                    |  |                   |
| TOTALS   | 3                         | 6                  | 11                                     | 5                 |

\* Labor costs relative to NRC licensed materials included in Decommissioning Plan for Production and Production Support Facilities (Table 3). Closure plan for Ecology-regulated areas already on file with Ecology.

| TOTAL - Storage Areas   | 69,757   |

#### 5.2.2 Containerized LLRW Inventory

The LLRW inventory consists of drummed or boxed waste materials that are radioactively contaminated but that do not designate as chemically dangerous per Ecology regulations. They are essentially all solid-phase materials; all of the relatively few drums containing liquids, e.g., radioactively contaminated oils, are stored on double containment pallets or in drums within drums. Treatment and/or disposal options are available for each of the major containerized LLRW categories; disposition pathways vary primarily based on combustible versus non-combustible classification of the waste. Primary disposition pathways include:

- for combustible wastes, incineration in Framatome's SWUR facility, followed by uranium recovery processing of the resultant ash; and
- for non-combustible LLRW, disposal at the U.S. Ecology-operated Hanford LLRW disposal site.

Table 26 summarizes the volumes and associated disposition costs for the containerized LLRW inventory. As noted in the table, current inventories are now somewhat lower than reasonably assumed maximum inventories, due in large part to the site's ongoing efforts to minimize its backlog of stored wastes. The maximum expected volumes have been conservatively utilized to estimate disposal cost liabilities.

#### 5.2.3 Containerized Mixed Waste Inventory

The containerized mixed waste inventory consists of wastes that are both radioactively contaminated and chemically dangerous (per Ecology criteria). Like the LLRW inventory, they are essentially all solid-phase; the few remaining liquid-containing drums are stored on containment pallets. Treatment and/or disposal options are available and being utilized for all of the major currently generated containerized mixed waste categories. Viable options for the final disposition of a relatively small volume of legacy mixed wastes and very small volume of currently generated mixed wastes have not been identified but continue to be pursued in the commercial sector.

Disposition pathways for the containerized mixed wastes depend primarily on the specific acceptance criteria of the available commercial mixed waste disposal vendors. Primary disposition pathways, depending on the specific waste stream, include:

- direct shipment to the contracted mixed waste disposal site for treatment and/or disposal with or without pre-compaction; and
- offsite treatment via a permitted commercial mixed waste treatment facility followed by disposal of the treated residues at the contracted mixed waste disposal facility.

Table 26 also summarizes the volumes and associated disposition costs for the containerized mixed waste inventory. As in the case of the non-mixed LLRW, the current inventory of containerized mixed wastes is smaller than currently assumed maximum inventories. As such, the maximum expected inventories have been utilized to estimate disposal cost liabilities.

Table 26 Containerized Waste Inventory Costs

|  | Disposal Rate<br>\$/ft <sup>3</sup> | Current <sup>4</sup><br>Volume ft <sup>3</sup> | Max<br>Expected<br>Volume ft <sup>3</sup> | Max Total Cost, \$ <sup>1</sup> |
|--|-------------------------------------|--|---|---------------------------------|

| Shipping Costs   |                                     |  |   | N/A***                          |

\* No incremental disposal costs above \$12.460M already allocated to US Ecology (see Table 9 b.)

\*\* Logistics/shipping support included in Table 12.

\*\*\* Disposal rates include shipping costs, as applicable.

<sup>1</sup> Because this waste is already containerized, the cost of containers is not included.

<sup>2</sup> Low-level radioactive waste

<sup>3</sup> Mixed waste

<sup>4</sup> As of October 1<sup>st</sup> 2017

### 5.3 Environmental Remediation

Decommissioning financial liability can be associated with environmental contamination with licensed materials to the extent that the contamination requires remediation during decommissioning to meet the unrestricted use criteria of 10 CFR 20.1402. At the Richland facility the most significant area of known soil contamination was the area associated with the legacy surface impoundment system. This historically contaminated area and its residual decommissioning liability are discussed below in Section 5.3.1. Similar discussion relative to other historic site spills/releases of licensed materials to the environment is provided in Section 5.3.2. Lastly, Section 5.3.3 addresses potential investigation/remediation costs associated with two potential soil contamination areas, namely soil underlying certain areas of the UO<sub>2</sub> Building and soil potentially impacted by underground piping.

#### 5.3.1 Legacy Surface Impoundment System

The Richland site maintained and operated a surface impoundment system over the time period of 1971-2004 for the management of the plant's radioactively-contaminated (low-level uranium) liquid effluents. Certain of those impoundments initially installed with single liner systems developed leaks, resulting in contamination of the underlying soil. The leaks also resulted in uranium contamination within the shallow unconfined groundwater aquifer underlying the site. From 1983 until their last usage in 2004, all of the impoundments were operated with multi-linered containment systems with inter-liner leak detection/leachate collection; no additional leaks were documented over that period.

The surface impoundment system has been removed from service in accordance with a consent decree and formal closure plan under Washington State Department of Ecology (Ecology) Dangerous Waste Regulations. The work involved processing of the stored waste inventory, removal/disposal of lagoon structural components, characterization of contamination levels in underlying soil, and remediation (removal and offsite disposal) of contaminated soil to meet Ecology cleanup levels for uranium and regulated non-radiological chemicals. Certification of completion of the work in accordance with the approved closure plan and associated soil cleanup levels was submitted to Ecology in September 2006; Ecology concurrence was received on November 14, 2006.

Framatome believes that the surface impoundment area now conservatively meets NRC requirements for unrestricted release and that no additional remediation will be required at the time of final plant decommissioning. The Ecology-imposed uranium cleanup level of 12.1 mg/kg translates to an activity level of 29 pCi/g for uranium at a U-235 enrichment of 3.5%. In reality the residual soil uranium concentrations present upon completion of the Ecology-mandated closure work were generally well below the 29 pCi/g limit in that cleanup to a very conservative fluoride soil cleanup limit typically drove soil removal/disposal to an extent well beyond that required to meet the uranium cleanup limit. Framatome has calculated **Derived Concentration Guideline Levels** (DCGLs) of 63 pCi/g for U-234 and 66 pCi/g for U-235, U-236, and U-238 based on RESRAD 6.3 and ICRP 30 (using more up-to-date ICRP models would yield even higher DCGLs). While realizing the final NRC release of the former surface impoundment area will be based on NRC-approved DCGLs and final status and confirmatory surveys, it is not anticipated that such DCGLs will necessitate cleanup beyond that already conducted.

In accordance with its NRC license (SNM-1227) and Ecology Groundwater Compliance Monitoring Plan, Framatome continues its semi-annual monitoring of downgradient wells for gross alpha and uranium. Groundwater levels of gross alpha and uranium have continued their decline over the last three years and are expected to continue to decline via natural attenuation

in that the Ecology uranium soil cleanup level was calculated to be protective of groundwater at the 30 ppb Ecology groundwater cleanup limit, which also corresponds to the current federal (EPA) drinking water limit for uranium. In the first-half 2017 groundwater sampling event, none of the site's six groundwater monitoring wells downgradient of the legacy surface impoundment area still exceeded 30 ppb uranium. The highest measurement during this most recent sampling event was 28.4 ppb uranium. It should be noted that there is no domestic or agricultural usage of groundwater on the Framatome site or on the hydrologically-downgradient US Department of Energy Hanford Site.

Residual decommissioning cost liabilities related to the legacy surface impoundment area are limited to the costs associated with the planning for, and the conduct of, a technically compliant final survey, including anticipated NRC regulatory oversight and the conduct of an NRC-required third party certification survey. These residual costs are addressed in Tables 27-30. The costs will be incurred at the time of final plant decommissioning in that the NRC has granted Framatome an alternate schedule for official decommissioning of the remediated surface impoundment area in accordance with 10 CFR 70.38(f) (November 15, 2006; TAC L31973).

### 5.3.2 Historic Spills and Releases (Documented)

As required by 10 CFR 70.25(g)(3), Framatome maintains records of information important to the decommissioning of the Richland site, which includes areas of known or suspect environmental contamination that will require additional characterization and, if needs be, remediation at the time of plant decommissioning. These potential environmental remediation areas are a subset of the areas listed per 10 CFR 70.25(g)(3)(ii), i.e., records of spills or other unusual occurrences involving the spread of contamination in and around the facility, equipment, or site. Information in this regard has been derived from two major sources, namely (1) a major site-wide remedial investigation/feasibility study (RI/FS) conducted in the early 1990s which included a formal hazardous substance source review (the RI/FS was in response to surface impoundment-related issues and included both radiological and non-radiological constituents), and (2) the site's ongoing hazardous spill/release reporting procedure and associated spill reports/log.

Records of these past spills/releases typically reveal residual contamination levels below 30 pCi/g uranium-based activity; furthermore most of the areas are highly localized and typically were remediated at the time of occurrence. Extensive environmental remediation efforts are not anticipated for these areas to meet decommissioning radiological release criteria. Costs will primarily be related to characterization (investigation, sampling, analysis) with the potential for limited soil removal costs. Any limited soil removal required will not result in incremental disposal costs in that the soil can be easily accommodated within the void spaces in the approximately 450 93 ft<sup>3</sup> burial boxes that will be utilized to contain removed facility equipment (see Table 9). A review of site spill logs for 2012 through October 2017 indicated no additional radiological environmental releases requiring evaluation at time of decommissioning beyond those previously accounted for. Estimated decommissioning costs related to environmental remediation of documented historic spills/releases (unrelated to the surface impoundments) are provided in Tables 31-34.

### 5.3.3 Potential Soil Contamination Areas

Beyond the legacy surface impoundment area and the pertinent historic spill/release sites discussed in Sections 5.3.1 and 5.3.2, respectively, two other environmental areas of potential soil contamination will need to be accessed and evaluated at the time of plant decommissioning. The first area is the soil underlying the historic and current wet chemical processing areas

[primarily ammonium diuranate (ADU) chemical conversion] within the Uranium Dioxide (UO<sub>2</sub>) Building. The long-term processing of uranium-bearing solutions in conjunction with concrete flooring challenged by the harsh chemical environment have created the possibility for the release of uranium to the soil column below those areas. Access to this soil for characterization and possible removal will necessitate concrete removal, soil characterization, soil excavation, and possible offsite soil disposal.

The second area of potential soil contamination is the soil underlying underground piping, historically or currently conveying uranium-bearing solutions. It is estimated that approximately 3,000 feet of trenching will be required to gain access for removal of the approximately 6,000 lineal feet of underground piping that has conveyed uranium-bearing solutions, past or present.

Estimated decommissioning costs for these two areas of potential soil contamination are provided in Tables 35-42. Conservatism relative to the UO<sub>2</sub> wet chemical processing area estimate include removal of 1400 ft<sup>2</sup> of concrete to allow backhoe access versus an implicated floor area of 500 ft<sup>2</sup>, and removal of all soil to a depth of ten feet over a total surface area of 1000 ft<sup>2</sup> (twice the implicated floor area). Relative to the underground piping removal/remediation, the estimate conservatively assumes soil removal/disposal to a depth of ten feet below ten percent of the 3000 feet of trenching.

Table 27 Residual Labor Requirements for Final Release of Former Surface Impoundment Area (Work Days)

Estimated number of work days by specific labor category that will be required to complete the planning and preparation for, and the conduct of, a final release survey for the former surface impoundment area.

| Activity  | Senior Engineer Work Days | Engineer Work Days | NRC Work Days | Health and Safety Technicians |
|---|---------------------------|--------------------|---------------|-------------------------------|
| Planning and Preparation  |                           |                    |               |                               |
| Preparation of Documentation for Regulatory Agencies                  | 10                        |                    |               |                               |
| Submittal of Decommissioning Plan to NRC when Required by 70.38(g)(1) | 5                         |                    | 15            |                               |
| Development of Work Plans   |                           | 5                  |               |                               |
| Procurement of Special Equipment                                      |                           | 4                  |               |                               |
| Staff Training  |                           | 4                  |               | 2                             |
| Conduct of Survey   |                           |                    |               |                               |
| Final Radiation Survey (gridding, sampling, sample preparation)       |                           | 12                 |               | 12                            |
| TOTALS  | 15                        | 25                 | 15            | 14                            |

Table 28 Total Labor Costs for Final Release of Former Surface Impoundment Area

| Containerized Waste for Burial | 20,100                           | *                    |                        | 262,700**               |                       |

\* Catalog price from commercial container supplier.

\*\* No incremental disposal costs above \$12.460M already allocated to US Ecology (see Table 9b).

\*\*\* Assumes 37 shipments at \$7,100/shipment based on current TN rates.

Table 41 Laboratory and Miscellaneous Costs – Potential Soil Contamination Areas – Soil Below UO<sub>2</sub> Building Wet Processing Area; Soil Underlying Underground Piping

| Activity/Item*                           | Cost, \$ |
|--|----------|
| Equipment (Backhoe) Charges              | 215,641  |
| Materials                                | 2,784    |
| Analytical                               |          |
| Uranium in soil (364 @ \$120 ea.)        | 43,680   |
| Nitrate/fluoride in soil (57 @ \$30 ea.) | 1,710    |
| TOTAL                                    | 263,815  |

\* Does not include miscellaneous expenses that apply for the site-wide decommissioning effort, e.g., insurance, NRC inspections, logistics support, etc. (see Table 12).

Table 42 Total Decommissioning Costs – Potential Soil Contamination Areas – Soil Below  
UO<sub>2</sub> Building Wet Processing Area; Soil Underlying Underground Piping

Total of reported costs in Tables 39, 40 and 41.

| Task/Component  | Cost, \$  |
|---|-----------|
| Development of Work Plans/Safety Plans<br>(from Table 39)   | 11,920    |
| Staff Training (from Table 39)                              | 5,710     |
| Environmental Investigation/Remediation<br>(from Table 39)  | 295,187   |
| Packing Material Costs (TOTAL from Table<br>40a)            | 401,400   |
| Shipping and Disposal Costs (from Table<br>40b)             | 262,700** |
| Laboratory and Miscellaneous Costs (TOTAL<br>from Table 41) | 263,815   |
| TOTAL – Potential Soil Contamination Areas                  | 1,240,732 |

#### 6.0 Adjustment of Cost Estimates and Funding Level

As required in 10 CFR 70.25(e), Framatome will adjust these cost estimates at intervals not to exceed three years. Associated funding levels will be adjusted as needed. Consistent with guidance in NUREG-1757, the review will consider changes in costs of goods and services, including inflation; changes in facility conditions or operations; and changes in expected decommissioning procedures.

## 7.0 Certification of Financial Assurance

Principal: Framatome Inc., 2101 Horn Rapids Road, Richland, WA 99354

NRC License Number SNM-1227 for Framatome Inc. (same address)

Issued to: U.S. Nuclear Regulatory Commission

I certify that Framatome Inc. is licensed to possess the following types of unsealed special nuclear material licensed under 10 CFR Part 70 in the following amounts:

| Type of Material  | Amount of Material |
|---|--------------------|
| Uranium compounds in any chemical/physical form enriched up to 5.00 wt. % U-235 (uranium compounds) | 120,000 kg U-235   |
| Uranium enriched in U-235 (any enrichment or chemical/physical form)                                | 350 g U-235        |

I also certify that financial assurance in the amount of \$66,425,800 has been obtained for the purpose of decommissioning as prescribed by 10 CFR Part 70.

Date

## **8.0 Financial Assurance Instruments**

This section provides copies of financial assurance instruments (Exhibits 1 and 2) to demonstrate financial assurance for all of the estimated decommissioning costs. The mechanism utilized by Framatome is the letter of credit/standby trust agreement provided for in 10 CFR 70.25 (f)(2).

Exhibit 1 - Irrevocable Standby Letter of Credit
