EXECUTIVE SUMMARY

In this Technical Report, the chemical and radionuclide contaminant results from the First Quarter Calendar Year 2018 (CY18) sample of Tank 50 salt solution are presented in tabulated form. The information from this characterization will be used by Savannah River Remediation (SRR) for the transfer of aqueous waste from Tank 50 to the Saltstone Production Facility, where the waste will be treated and disposed of in the Saltstone Disposal Facility. This Technical Report compares results, where applicable, to Saltstone Waste Acceptance Criteria (WAC) limits and targets.¹ The chemical and radionuclide contaminant results from the characterization of the First Quarter CY18 sampling of Tank 50 were requested by SRR personnel via a Task Technical Request (TTR)² and details of the testing are presented in the Savannah River National Laboratory (SRNL) Task Technical and Quality Assurance Plan (TTQAP).³ This Technical Report is part of Deliverable 2 relating to Task 1 from the SRR request.² Data pertaining to the regulatory limits for Resource Conservation and Recovery Act (RCRA) metals will be documented at a later time per the TTQAP for the Tank 50 Saltstone task.³

The following facts pertaining to the WAC are drawn from the analytical results provided in this report:

- WAC targets or limits were met for all analyzed chemical and radioactive contaminants for which the detection limits are below the WAC targets or limits.
- Isopar L has a higher detection limit⁴ compared with the current Saltstone WAC¹ value of 11 ppm that has been in effect since revision 12 of the WAC dating back to July of 2013.⁵
- Nitrosamines were not detected in the Tank 50 salt solution sample above the instrument detection limits of < 1 mg/L.
- The minimum detection limit is reported for ⁹⁴Nb as determined from the minimum detectable activity associated with the radiochemical method used for this radionuclide. The reported detection limit is above the requested SRR target minimum detection limit concentration.⁶ However, the minimum detection limits reported for the First Quarter CY18 Tank 50 sample for ⁹⁴Nb is lower than the estimated detection limit initially established by SRNL in 2009.⁷ Thus per guidance from SRR,⁶ SRNL continues to achieve as low as practical detection limits for these radionuclides.

1.0 Introduction

Tank 50 aqueous waste is analyzed on a quarterly basis and the results are compared to the Waste Acceptance Criteria (WAC) of the Z-Area Saltstone Production Facility.¹ The quarterly Regulatory Compliance samples pulled in Tank 50 should be characterized for both Limit and Target acceptance criteria in this WAC.¹ The information from this characterization will be used by Savannah River Remediation (SRR) for the transfer of aqueous waste from Tank 50 to the Saltstone Production Facility, where the waste will be treated and disposed of in the Saltstone Disposal Facility. This Technical Report compares results, where applicable, to Saltstone WAC limits and targets.¹ A memorandum reporting the average Cs-137 value has been previously issued.⁸

2.0 Experimental

2.1 Technical

The First Quarter CY18 Tank 50 samples [a 200-mL sample obtained 6” below the surface (HTF-50-18-13) and a 1-L variable depth sample obtained 66” from the tank bottom (HTF-50-18-12)] were obtained on February 6, 2018 and received at Savannah River National Laboratory (SRNL) on February 6, 2018.⁹

The slurry in the steel variable depth sampler was transferred by pumping into a 2-L high-density polyethylene (HDPE) bottle. The transferred slurry was left to settle in the 2-L bottle. Visual inspection of the inside of the steel sampler indicated there were no visible solids remaining in the sampler, so no clear supernate was returned to the sampler for rinsing. The 2-L HDPE bottle was agitated to disperse thoroughly the extremely limited suspended solids into the supernate. Aliquots of slurry samples were promptly collected with slurry pipettes to minimize settling effects and placed into HDPE bottles. Samples removed from the 200-mL surface sample were transferred using glass pipettes into clean glass sample vials with Teflon lined caps. Amber colored glass sample vials were used for the samples that were analyzed for nitrosamines to minimize exposure to light.

Unless otherwise stated, all of the concentrations presented in the tables (except upper limits) are averages based on triplicate analyses of the First Quarter CY18 Tank 50 samples. The standard deviation of each average is also presented. Several of the contaminants were either not detected in the slurry samples or detected at values below the method reporting limit (MRL). For contaminants not detected or detected below the MRL, the result is preceded by a “<”, which indicates the result is an upper limit based on the sensitivity of the method used to analyze the individual analyte. If only one value out of the triplicate analysis is above the detection limit, then that single value is reported and noted in the tables. Also, if only two values out of the triplicate analyses are above the detection limit, then the average of those two values is reported and noted in the tables. All volatile organic analysis (VOA) and semi-volatile organic analysis (SVOA) were performed on the surface sample and all other analyses were performed on the variable depth sample. Data reported for atomic absorption (AA), cold-vapor atomic absorption (CVAA), inductively coupled plasma atomic emission spectroscopy (ICP-AES) and inductively coupled plasma mass spectrometry (ICP-MS) are derived from the digested Tank 50 supernate by the aqua regia method.¹⁰ Anion and the ammonium cation analyses are determined from Ion Chromatography (IC). Total Inorganic Carbon/Total Organic Carbon (TIC/TOC) analysis was used to measure the TIC (carbonate) and TOC components. The tetraphenylborate anion and ethylenediaminetetraacetate (EDTA) were analyzed using High Performance Liquid Chromatography (HPLC). All the above analyses excluding VOA and SVOA used approximately 150 mL of the 1-L variable depth sample. A 3-mL sample of the slurry was used to determine the density of the slurry using an Anton-Paar DMA 35n portable density meter. Total and soluble weight percent solids were determined on portions of the Tank 50 sample using the “Weight Percent Solids Determination Using a Furnace or Oven” procedure from the Environmental & Chemical Process Technology research programs section.¹¹

Approximately 630 mL of the variable depth sample were used to determine all the measured radionuclide concentrations in triplicate. Radionuclides reported using the ICP-MS method are converted from a reported mass per volume basis to activity per volume units using the specific activities (Ci/g) reported from the Department of Energy 1996 Integrated Data Base Report.¹²

Total mercury was analyzed by SRNL using the CVAA method. Other mercury (Hg) speciation data shown in Table 3-1, Table 3-2, and Table 3-5 are calculated from previous work as analyzed by Cold Vapor Atomic Fluorescence Spectroscopy (CVAFS).¹³ These species include elemental mercury (Hg(0)), monomethyl mercury, ethyl mercury, and dimethyl mercury. Monomethyl, ethyl, and dimethyl mercury are organomercury species. The concentration values for the organomercury species are calculated from the Hg speciation data on a mg Hg/L basis.¹³ As a sample calculation for monomethyl mercury, information from Reference 13 shows that the reported average monomethyl concentration on a mg Hg/L basis is 36.6 mg Hg/L. This value is then multiplied by the formula weight of monomethyl mercury from the WAC¹ (215.62 g monomethyl mercury/mole) divided by the molecular weight of Hg (200.6 g Hg/mole). Thus, the calculated concentration of the species monomethyl mercury is $36.6 \text{ mg Hg/L} \times (215.62 \text{ g monomethyl mercury/mole} / 200.6 \text{ g Hg/mole}) = 39.3 \text{ mg monomethyl mercury/L}$.

2.2 Quality Assurance

Quality Assurance requirements for performing reviews of technical reports and the extent of review are established in manual E7 2.60.¹⁴ SRNL documents the extent and type of review using the SRNL Technical Report Design Checklist contained in WSRC-IM-2002-00011, Rev. 2.¹⁵

3.0 Results and Discussion

Analyzed nonradionuclide chemical concentrations, their standard deviations and their corresponding WAC Limits¹ are shown in Table 3-1 that correspond to the Attachment 8.1 Limits in the WAC.¹ Per the WAC, the Limits shown shall not be exceeded accounting for the analytical uncertainty in each measured concentration.¹ Analyzed nonradionuclide chemical concentrations, their standard deviations and their corresponding WAC Targets¹ are shown in Table 3-2 that correspond to the Attachment 8.2 Targets in the WAC.¹ Per the WAC, the Targets shown shall not be exceeded accounting for the analytical uncertainty in each measured concentration.¹ The Limits refer to a type of acceptance criteria that, if not satisfied, will have an adverse impact on repository requirements, whereas the Targets refer to a type of acceptance criteria that is set as a guideline to protect a Limit.¹ For the chemical contaminants and the radionuclides given in tables below, an analytical uncertainty of 2 Sigma (2σ) shall be accounted for in sample analyses used to determine the analytical uncertainty vs. either the Limit or Target. The standard deviations given in tables for this WAC report are taken as 1 Sigma (1σ) values that are calculated from the normal 'standard deviation' function for either duplicate or triplicate values from within Excel[®] spreadsheets.

Analyzed radionuclide concentrations and the respective radiochemical analysis methods, their standard deviations and their corresponding WAC Targets and Limits are shown in Table 3-3 and Table 3-4, respectively. These tables correspond to Attachment 8.3 Limits and Attachment 8.4 Targets, respectively, from the WAC.¹ The minimum detection limit reported for ⁹⁴Nb of $< 3.52\text{E-}01 \text{ pCi/mL}$ in Table 3-4 is above the requested SRR target minimum detection limit of $2.0\text{E-}03 \text{ pCi/mL}$ ⁶ but is lower than the estimated detection limit initially established by SRNL of $4.38\text{E-}01 \text{ pCi/mL}$ in 2009.⁷

- Result is calculated from the measured Al concentration assuming all the Al is present as the OH compound.
- Measurement performed on filtered supernate samples.
- Measurement performed on duplicate samples rather than triplicate samples.
- Result is calculated from the reported concentration of < 33 mg/L and the density of the slurry sample listed in Table 8.
- Mercury species calculated from data presented in Reference 13.

Curium-245 (²⁴⁵ Cm)	Am/Cm	<1.59E+00	NA	2.25E+05

- a. Only one detectable value from the analyzed triplicate set.
b. Only two detectable values from the analyzed triplicate set.

The following tables show various chemical contaminants (Table 3-5), organic species (Table 3-6) and processing constituents (Table 3-7) related to the Saltstone Disposal Unit (SDU) that are referred to in the WAC per Tables 2, 3 and 4, respectively.¹

Table 3-5. Chemical Contaminants Impacting Saltstone Disposal Unit (SDU) Flammability from First Quarter CY18 Tank 50 Samples and Saltstone WAC, Revision 17, Table 2 Limits and Targets¹

<u>Chemical Name (Formula)</u>	<u>Method</u>	<u>Average Concentration (mg/L)</u>	<u>Std. Dev.</u>	<u>WAC Limit/Target</u>
Isopar L (----)	SVOA	< 2.67E+01 ppm ^{a,b}	NA	1.10E+01 ppm (Limit)
Tetraphenylborate [TPB] (B(C ₆ H ₅) ₄)	HPLC	< 5.00E+00	NA	5.00E+00 mg/L (Limit)
Ammonium (NH ₄ ⁺)	IC	< 1.00E+02	NA	2.12E+02 mg/L (Limit)
Total Mercury (Hg)	CVAA	6.76E+01	3.98E-01	3.25E+02 mg/L (Limit)
Monomethyl Mercury (CH ₃ Hg)	CVAFS w/ Distillation	3.93E+01 ^c	2.01E+00	3.50E+02 mg/L (Limit)
Dimethyl Mercury ((CH ₃) ₂ Hg)	CVAFS	1.06E-01 ^c	2.97E-03	1.00E+00 mg/L (Target)

- a. Measurement performed on duplicate samples rather than triplicate samples.
b. Result is calculated from the reported concentration of < 33 mg/L and the density of the slurry sample listed in Table 8.
c. Mercury species calculated from data presented in Reference 13.

Table 3-6. Other Organics Impacting SDU Flammability from First Quarter CY18 Tank 50 Samples and Saltstone WAC, Revision 17, Table 3 Concentrations¹

<u>Chemical Name (Formula)</u>	<u>Method</u>	<u>Average Concentration (mg/L)</u>	<u>Std. Dev.</u>	<u>WAC Concentrations (mg/L)</u>
Butanol (C ₄ H ₉ OH)	VOA	< 5.00E-01	NA	0.75
Tributylphosphate[TBP] ((C ₄ H ₉ O) ₃ PO)	SVOA	< 7.50E-01	NA	1.0
Isopropanol (C ₃ H ₇ OH)	VOA	< 2.50E-01	NA	0.25
Methanol (CH ₃ OH)	a	NA	NA	0.05
NORPAR 13 (C _n H _{2.n})	SVOA	< 7.50E-01	NA	0.75

a. Currently, a routine method for detecting this species does not exist in AD.

Table 3-7. Processing Constituents from First Quarter CY18 Tank 50 Samples and Saltstone WAC, Revision 17, Table 4 Limits¹

<u>Processing Constituents</u>	<u>Method</u>	<u>Value</u>	<u>Std. Dev.</u>	<u>WAC Limit</u>
pH	Calculated	> 13	NA	> 10
Sodium Concentration	ICP-ES	5.26M	2.96E-02	2.5 M < [Na ⁺] < 7.0 M
Total Insoluble Solids	Calculated	~0 wt%	NA	< 15 wt%

Table 3-8 contains additional measured constituents per the TTQAP.³ This table also includes formate analysis and the Total Organic Carbon (TOC) (minus formate & oxalate) as shown in Appendix 1 of the WAC. The average and standard deviation that may be used to determine the 95% confidence interval for the First Quarter CY18 are shown. These standard deviations include the variance in each triplicate analysis set as well as the one-sigma instrument uncertainty of 10% reported for each value. These values were calculated using the Guide for the Expression of Uncertainty in Measurement (GUM) Workbench statistical package.¹⁶ These data indicate that, at the 95% confidence interval, the calculated TOC (minus formate & oxalate) could be in the approximate range of 7 to 133 mg/L for the First Quarter CY18 sample, i.e., the average ± 2X Std. Dev.

Table 3-8. Additional Measured Constituents³

<u>Constituent</u>	<u>Method</u>	<u>Average Value</u>	<u>Std. Dev.</u>
Density (slurry)	Measured (23.9°C)	1.2369 g/mL	0.0001
Specific Gravity	a	1.2406	0.0001
Total Solids	Measured	27.47 wt%	0.21
Total Beta	LSC	1.11E+06 pCi/mL	2.33E+05
Total Gamma	b	8.12E+05 pCi/mL	3.20E+04 ^c
Beryllium (Be)	ICP-ES	< 1.92E-01	NA
N-Nitrosodimethylamine ^d (C ₂ H ₆ N ₂ O)	SVOA	< 1 mg/L	NA
N-Dioctylnitrosamine ^d (C ₁₆ H ₃₄ N ₂ O)	SVOA	< 1 mg/L	NA
Formate (HCO ₂) ^e	IC	2.08E+02 mg/L	4.93E+00
Total Organic Carbon (minus formate & oxalate) ^f	Calculated	6.97E+01 mg/L	3.17E+01 ^g

- a. Calculated from the measured density of slurry and density of water at 24.9 °C.¹⁷
b. Calculated from the sum of gamma emitters (Sb-126, Sn-126, Sb-125, Eu-154, Am-241, Co-60 and Ba-137m).
c. Value is the “standard error of the mean” rather than the standard deviation of the measurements since its calculation involves multiple radionuclides.
d. Nitrosamines analysis requested in TTR.²
e. Formate is not required by the WAC but is used in the Total Organic Carbon (minus formate & oxalate) calculation.¹
f. Total Organic Carbon (minus formate & oxalate) as shown in Appendix 1 of the WAC.¹
g. Standard deviation includes uncertainty in the triplicate analysis and the one-sigma instrument uncertainty.

4.0 Conclusions

The following conclusions pertaining to the WAC are drawn from the analytical results provided in this report:

- WAC targets or limits were met for all analyzed chemical and radioactive contaminants for which the detection limits are below the WAC targets or limits.
- Isopar L has a higher detection limit compared with the current Saltstone WAC value of 11 ppm that has been in effect since revision 12 of the WAC dating back to July of 2013.
- Nitrosamines were not detected in the Tank 50 salt solution sample above the instrument detection limits of < 1 mg/L.
- The minimum detection limit is reported for ⁹⁴Nb as determined from the minimum detectable activity associated with the radiochemical method used for this radionuclide. The reported detection limit is above the requested SRR target minimum detection limit concentration. However, the minimum detection limits reported for the First Quarter CY18 Tank 50 sample for ⁹⁴Nb is lower than the estimated detection limit initially established by SRNL in 2009. Thus, per guidance from SRR, SRNL continues to achieve as low as practical detection limits for these radionuclides.
