If I had them, the use of the words "operating cycle" would have made my last e-mail a lot easier to understand. Thank you to Tammy at Exelon.

You can use run. Both are referred to that at times. The time between two refueling outages is called an operating cycle. Also, we tend to call the period from which a plant starts up from an outage and then shuts down from an outage without taking it offline in between - breaker to breaker. Hope this helps.

Hi Tammy,

I need a word or a couple of words to describe the length of time a nuclear reactor is operating. Would that be a "run" such as a 45 day run? And I need a word or a couple of words to describe the length of time a nuclear reactor starts up from a refuel outage to the time it finally shuts down to start the next refuel outage.

I realized that I probably would call each a run but usually I would be talking to people who have an understanding of the situation (that is similar to mine). I am now writing to people who do not have that understanding and I don't want to confuse them.

I would appreciate some help.

Thank you,

Tom
