Donald C. Cook Nuclear Plant Unit No. 1
Docket No. 50-315
DPR No. 58

Regulatory

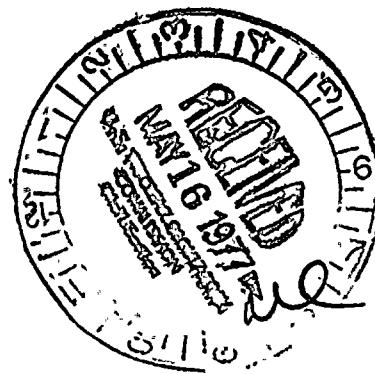

File Cy.

Mr. Benard C. Rusche, Director
Office of Nuclear Reactor Regulation
U.S. Nuclear Regulatory Commission
Washington, D.C. 20555

Dear Mr. Rusche:

This letter clarifies and amends our letter of April 6, 1977 regarding flushing or hot functional testing of Unit No. 2 using the auxiliary feedwater system while Unit 1 is in operation. A revision is necessary to the information transmitted in this previous letter regarding the identification of the valves and the safety requirements of the auxiliary feedwater system.

Corrected figures showing the proper valve nomenclature and line-up are attached to this letter. These figures show the valve alignment necessary to valve-out suction to the motor driven feedwater pumps from the Unit 1 condensate storage tank. In the unlikely event the auxiliary feedwater to Unit 1 is required while flushing or hot functional testing operations in Unit 2 are underway, water will be available to the motor driven feedwater pumps from the Unit 2 condensate storage tank. The auxiliary feedwater valves to Unit 2 will automatically close, and the valves from the motor-operated auxiliary feedwater pumps to Unit 1 will be opened by the operator from the control room. Further, during both flushing and hot functional testing operations, the Unit 2 condensate storage tank water volume will be maintained at a minimum of 175,000 gallons (the same as is currently required for the Unit 1 tank) by administrative control. Thus, this valve alignment replaces the Unit 2 condensate storage

Conseguemos que el 2 de febrero se realizó la reunión entre los representantes de las tres autoridades y el director general de la Caja de Pensiones para la Vejez y de las Vejandas, en la cual se acordó que se establecería una comisión mixta para tratar de la situación.

¹ See, e.g., *United States v. Ladd*, 100 F.2d 100, 103 (5th Cir. 1938) (holding that a conviction for mail fraud was not collaterally estopped from being used as an element of proof in a subsequent trial for mail fraud).

Then, because of the great variation in the amount of energy available, the rate of self-renewal varies from one type of cell to another. In addition, a single cell may have different rates of self-renewal at different times during its life cycle. For example, the rate of self-renewal of stem cells in the gut lining increases as they move towards the base of the crypt, where they undergo division to produce new stem cells.

tank for the Unit 1 tank as the suction for the motor driven feedwater pumps. This assures that the same degree of system redundancy and reliability is maintained as is required under our current mode of operation.

In our April 6, 1977 letter we also stated that in the event auxiliary feedwater is required for Unit No. 1 during these operations, it would take 30 minutes to switch the motor driven feedpump to the Unit 1 tank. By tying into the Unit 2 condensate storage tank as described above, this reliance on a 30 minute switchover time is not required to assure auxiliary feedwater to Unit 1. A further statement is made that references the 30 minute time requirement for the accident analysis in FSAR Section 14.2.4, the steam generator tube rupture. Other analyses, such as the loss of feedwater, require auxiliary feedwater in shorter times.

As stated above, the intended mode of operation during flushing and hot functional testing will not significantly change the times associated with delivery of auxiliary feedwater, but will only change the source of water to the motor driven auxiliary feedwater pumps. Therefore, it is concluded that the technical specification interpretation in our April 6, 1977 letter does not change the mode of auxiliary feedwater operation as used in the safety analysis and therefore does not constitute an unreviewed safety problem nor will it adversely affect the health and safety of the public.

We will assume our interpretation of the Technical Specifications and reporting requirements to be correct with respect to our flushing and hot functional testing requirements unless we hear otherwise from you.

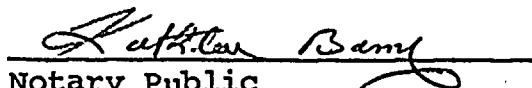

Very truly yours,

John Tillinghast
Vice President
