## Background Information

- During testing of the PORVs in operation at another facility, the noise level in the MCR was approximately 85 dB(A) and the noise level at the PORVs was approximately 110 dB(A).
- The size and geometry of the PORV block valves cause a high flow velocity (~800 ft/sec) and Helmholtz resonance which results in an increase in noise level. Since the PORV block valves are located in rooms adjacent to the MCR, the sound from the PORV block valves is transmitted into the MCR.
- reduce the noise contribution to the MCR and improve human factors with the PORVs in Changes to the PORV block valves and PORV branch lines are necessary in order to operation.
- Increase the size of the PORV branch line to reduce the flow velocity through the line
- Change PORV block valve to a type of valve less susceptible to generating noise

ONE TEAM. ONE VISION. ONE GOAL.

# Current vs Proposed Design

### **Current Design**

- The current design has one 6" branch line off of each main steam lines, through a 6" block valve (gate type), to each PORV.
- A 6" branch line comes off each main steam line <u>downstream</u> of the main steam safety valves (MSSVs) and upstream of the main steam isolation valve (MSIV).

### **Proposed Design**

- The proposed design has one 12" branch line off of each main steam lines, through a 12" block valve (globe type), to each PORV.
- The 12" branch line comes off each main steam line <u>upstream</u> of the main steam safety valves (MSSVs) and upstream of the main steam isolation valve (MSIV).
  - The PORV is unchanged

📥 Southern Nuclear 🛛 📥 Georgia Power

S

Technical Evaluation	There is no change to the safety class or safety-related functions of the valves and piping involved.	Relocating the branch line closer to containment maintains compliance with General Design Criteria (GDC) 57.	No impact to Chapter 15 evaluations. The mass release during a Steam Generator Tube Rupture would be limited by the PORV which is more restrictive.	Updated analyses confirm that the wall adjacent to the main control room (Wall L) is unaffected.	ONE TEAM. ONE VISION. ONE GOAL.	Vogtle 3&4 Building the future of nuclear power in America

#### PAR

 A PAR is planned to be requested soon to allow installation (at-risk) of piping in the MSIV compartment
