Note 1: Where there is a combination of radionuclides, the limit for the combination should be derived as follows: Determine the amount of each radionuclide possessed and 1,000 times the amount in Appendix B for each of those radionuclides when not in combination. The sum of the ratios of those quantities may not exceed 1.

$$\text{Example: } \frac{\text{Amt. of Radionuclide A possessed}}{1000 \times \text{Appendix B quantity for Radionuclide A}} + \frac{\text{Amt. of Radionuclide B possessed}}{1000 \times \text{Appendix B quantity for Radionuclide B}} \leq 1$$

Note 2: To convert microcuries (μCi) to SI units of kilobecquerels (kBq), multiply the above values by 37.
Example: Zirconium-97 (10 μCi multiplied by 37 is equivalent to 370 kBq).

Comment [MP1]: Remove, not in the SSR or CFR. The calculation isn't correct as written. For exempt concentrations a mixed source should be considered under Appendix A. Appendix B is an absolute quantity, the unity rule does not apply.
