1 The Emergency Director should declare the event promptly upon determining that time limit has been exceeded, or will likely be exceeded

2 If an ongoing release is detected and the release start time is unknown, assume that the release duration has exceeded the specified time limit

3 If the effluent flow past an effluent monitor is known to have stopped, indicating that the release path is isolated, the effluent monitor reading is no longer VALID for classification purposes

4 The pre-calculated effluent monitor values presented in EALs RA1.1, RS1.1 and RG1.1 should be used for emergency classification assessments until the results from a dose assessment using actual meteorology are available

5 If the equipment in the listed room or area was already inoperable or out-of-service before the event occurred, then no emergency classification is warranted

6 If CONTAINMENT CLOSURE is re-established prior to exceeding the 30-minute time limit, declaration of a General Emergency is **not** required

7 This EAL does not apply to routine traffic impediments such as fog, snow, ice, or vehicle breakdowns or accidents

8 A manual scram action is any operator action, or set of actions, which causes the control rods to be rapidly inserted into the core, and does **not** include manually driving in control rods or implementation of boron injection strategies

9 If the affected SAFETY SYSTEM train was already inoperable or out of service before the hazardous event occurred, then emergency classification is **not** warranted

10 If the hazardous event **only** resulted in VISIBLE DAMAGE, with **no** indications of degraded performance to at least one train of a SAFETY SYSTEM, then this emergency classification is **not** warranted
