ADDENDUM TO SYNOPSIS OF RESEARCH INSITU URANIUM LEACHING PROJECT
MINERALS EXPLORATION COMPANY
SWEETWATER COUNTY, WYOMING

RESULTS OF AQUIFER STABILIZATION OBSERVATION AND OTHER SURVEYS

REVIEW

Minerals Exploration, a wholly-owned subsidiary of Union Oil Company of California, conducted a research insitu uranium leaching test project in the Great Divide Basin, Sweetwater County, Wyoming from August 1976 to September 1978. This project was operated under the captioned State and Federal licenses. The results and activities of this test through September 1978 were fully described in a report by W.C. Goth. At the time of shutdown, commitments were made to perform soil and gamma surveys and to observe groundwater quality in the spring and summer of 1979 to demonstrate that the completed groundwater restoration is stable. The report summarizes the results of those commitments.

GROUNDWATER MONITORING

After the shutdown in September 1978, all of the pumps were pulled from the wells, and the wells were not disturbed until spring. On April 25, 1979, Minerals personnel met with

1592 150

14055
243
7912170

personnel from LQD's Lander office to sample the wells. Wells were sampled by lowering a pump into the casing to a depth of 100 feet and pumping one casing volume out before sampling. Due to pump problems, part of the sampling had to be delayed until May 10. At this time, the same persons completed the sampling program. The samples were analyzed by Chemical and Geological Labs in Casper, Wyoming except for radiometric analyses, which were performed by Eberline Labs, Albuquerque, New Mexico.

The wells were sampled again on July 11 and 12, 1979. Personnel from LQD's Lander office and from the Water Quality Division in Cheyenne were present and took duplicate samples. Minerals' samples were again analyzed at Chemical and Geological Labs, except for the radiometric analyses, which were performed by Ecology Audits in Casper, Wyoming.

Tables 1 through 23 present the results of these analyses (1 well per table). Each table has five columns with the following information: The limit of detection for constituents which are near or below the limit, The baseline values, The values as of September 1, 1978 when restoration concluded, and The values from the spring and summer samplings. Table 24 lists the relative locations and depths of the wells.

SOIL EVALUATION IN EVAPORATION/RETENTION POND

Map A is a detailed map of the natural depression which was used as a retention area/evaporation pond during the

operation and pumpout. This area was fenced off and had a 2-foot earthen dike around it, but was unlined. The map indicates the locations that were inundated within the fenced area, the locations of the soil sampling locations, and the location of the gamma survey points. The area was completely dry by November 1978. Soil sampling was performed by digging a small pit with a backhoe. After the pit was complete, the sidewalls were sampled through the prescribed intervals, and the lithology was described. Figures 1 through 6 depict the lithologic descriptions.

The soil samples were analyzed for selenium, arsenic, molybdenum, radium-226, uranium, conductivity, and pH by Chemical and Geological Laboratories in Casper except for the radium which was performed by Eberline Labs. Table 25 lists the results of these tests.

The soils appear to be fairly uniform in all respects and suitable as a revegetation substrate. Two locations showed higher than usual uranium values. The soil in location A showed high values of uranium from 2.5 to 10 feet. This location is 700 feet away from and 10 feet higher than the retention area and was previously undisturbed. Therefore, it was concluded that this occurrence is a natural phenomenon. The other high uranium value occurred within the top 6 inches of sample point D, which was near the outfall of the discharge pipe. It is accompanied by a high Ra-226 value.

GAMMA SURVEY

A gamma dose rate survey was performed on a grid of 45 points within the retention area. The grid is illustrated on Map A. Test particulars and results are listed in Table 26.

From the statistical analysis at the bottom of Table 9, it is concluded that the difference between areas inundated at one time or another and areas not inundated is not significant.

PROPOSED RECLAMATION PLANS

1. The individual well houses will be removed. The sand screen in the wells will be removed, if possible. The pattern wells and the monitor wells will be plugged according to LQD guidelines, and the casing will be cut off below grade. Approximately 6 inches of sand were placed inside each well house at the beginning of the project to absorb spills. This sand will be removed and disposed of according to paragraph 6. The entire area will be scarified and revegetated according to the requirements of License to Explore #17. Roads and trails other than the access road will be scarified and revegetated.

2. The fence surrounding the evaporation pond/retention area will be taken down as will the snow fences within. The fence around the discharge pipeline from the plant to the retention area will be taken down, the pipe removed, the ditch refilled, and the area revegetated as per paragraph 1. The top 6 inches of soil downstream from the outfall of the discharge pipe will

be removed as shown on Map A and disposed of as described in paragraph 6. The area will encompass that which was inundated and extend from the outfall to the present location of the first snow fence. This would amount to approximately 2800 square feet, or about 50 cubic yards of soil. The segment of the retention area which had been inundated plus any other segment significantly disturbed will be scarified and revegetated.

3. The two 10' x 30' metal buildings and the quonset type building will be left standing as storage facilities for the Sweetwater Mine. The plant equipment and building interior will be checked and cleansed of removable surface contamination according to NRC Annex C guidelines. The plant equipment will be removed for similar usage elsewhere or disposal as described in paragraph 6. The dirt floor will be removed to a depth of 6 inches and disposed of as described in paragraph 6. The fence around the metal buildings will be left standing. The lab and office trailers, fuel tanks, generators, and the generator buildings have already been removed. At some point in the future, the metal buildings will be removed, the fence taken down, and the area revegetated and re-contoured as per paragraph 1.

4. The freshwater well will be abandoned and its building will be removed.

5. The contents of the lined sump mentioned in Item 13b, p. 51 of the Application for Amendments, Modifications to Source Materials License SUA-1223, NRC Docket No. 40-8348 will be left as it is (covered and fenced in) until Minerals Exploration Company's mill is in operation. At that time, the contents of the sump will be transferred to the Sweetwater Project's mill tailings area. The 6'W x 6'D x 25'L sump will be refilled and revegetated. This is in accordance with Item 17 of the revised license, dated July 14, 1977.

6. All solid waste from the reclamation proceedings will be treated in 1 of 2 ways. Soil (expected volume, 150 cubic yards) and other materials not readily decontaminated will be deposited in the Sweetwater mill tailings area when that facility becomes operational. Items for disposal which can be decontaminated will be cleansed and placed in the mill's solid waste dump. Commitments made in Items 1 through 6 will be completed within 2 years of the time permission is obtained to commence reclamation. Progress of revegetation will be addressed in the annual report for License to Explore #17 until revegetation is complete.

F-6	1	2	2	4.4	8.4	1.2	0.4	1.0

Depths

Sample 1 0.0-0.5 feet
 Sample 2 0.5-1.5 feet
 Sample 3 1.5-2.5 feet
 Sample 4 2.5-4.5 feet
 Sample 5 4.5-7.5 feet
 Sample 6 7.5-10.0 feet

Detection Limits

Arsenic 1 mg/g
 Selenium 1 mg/g

pH was made on a saturation paste

Table 26
GAMMA SURVEY - IN SITU SITE

A Gamma Dose Rate Survey was performed at the in situ leach plant evaporation pond utilizing a Reuter-Stokes environmental monitor, model #RSS-111. Instrument's specs are: sensitivity = 20 $\mu\text{r}/\text{hr}.$, flux range = 1-500 $\mu\text{r}/\text{hr}$. and accuracy = 5% @ 10 $\mu\text{r}/\text{hr}$. The data that was obtained is summarized below. Raw data is on file in the Rawlins Office, MEC.

<u>Point #</u>	<u>Date of Reading</u>	<u>Reading*</u>	<u>Point #</u>	<u>Date of Reading</u>	<u>Reading*</u>
A1	1-10-79	16.0	E4	12-29-78	7.5
A2	1-10-79	14.5	E5	12-28-78	3.0
A3	1-10-79	16.0	E6	12-29-78	12.5
A4	1-10-79	15.0	E7	12-29-78	17.0
B1	1-10-79	14.5	E8	12-29-78	22.5
B2	1-9-79	13.0	E9	12-29-78	15.0
B3	1-9-79	13.5	F5	12-29-78	6.0
B4	1-10-79	15.0	F6	12-29-78	7.5
C1	1-9-79	14.0	F7	12-29-78	8.0
C2	1-9-79	14.0	F8	12-29-78	10.0
C3	1-9-79	14.0	F9	12-29-78	11.5
