ELECTRIC ENGINEERING  
DEPARTMENT

December 18, 1979

Mr. Boyce H. Grier, Director  
Office of Inspection and Enforcement  
Region 1, USNRC  
631 Park Avenue  
King of Prussia, PA. 19406

Dear Mr. Grier:

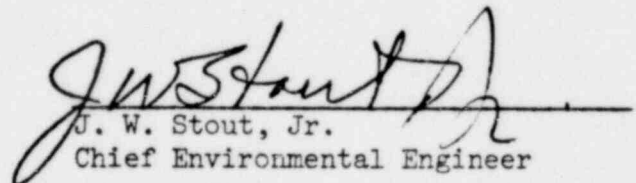

Subject: Calvert Cliffs Nuclear Power Plant  
Units Nos. 1 and 2  
License Nos. DPR-53 and 69  
Nonroutine Radiological Environmental  
Operating Report

This report is submitted, in duplicate, to comply with the requirements of Appendix B Environmental Technical Specifications Section 5.6.2.b.

The Oyster samples were collected on October 30, 1979 from the Camp Conoy sampling location and analyzed for gamma-emitting radionuclides as required. The results of the analyses showed the presence of Ag-110m at  $253 \pm 12$  pCi/Kg(wet). The oyster samples collected on the same date from the Kenwood Beach sampling location (the background location) showed Ag-110m at  $\leq 7$  pCi/Kg(wet).

Based on the observed levels of Ag-110m during this sampling period, for an average adult consuming one kilogram of oysters per year the doses to the GI Tract and Whole Body are estimated at  $\sim 1.5 \times 10^{-2}$  mrem/year and  $\sim 2.2 \times 10^{-5}$  mrem/year, respectively. These are very small fractions of the allowable 25 mrem/year (GI Tract) and 25 mrem/year (Whole Body) doses to members of the general public, (40 CFR Part 190 Environmental Radiation Protection Standards for Nuclear Power Operations) and are therefore considered to be of no consequence to the health and safety of the public.

Very truly yours,

  
J. W. Stout, Jr.  
Chief Environmental Engineer
