4/2 4:30 a.m. Ross

Have taken waste gas sample – no analysis yet.
local anal for H_2 → Bettis
25 cc sample reads 2 R/hr
Noise analysis – B&W tracking bubble
with it – guy in charge of analysis
says you can't conclude from noise
analysis that bubble is gone.

Denny & Ashok bubble calculation (same
simple one as before)

Hanauer worried over pressure trace
Bob Kryter at ORNL was contacted by Ross
Gil Ziegler is SAI expert on site – SHH says he's OK
The two are to consult (Bert Ackerman & Fry) Robinson
Kryter will in turn consult experts & one or
more will come up to review data
concern is with low pressure swing
on reactor pressure – plant computer
sees same thing – QA of noise
monitor confirms inst OK

Spare recombiner location is known to
the utility – ready to ship

Flow transmitter in idle hot leg
has gone bad – only one in that leg
Flow transm in operating loop is OK
B&W has advised that other instruments
can be predicted to begin to fail
about now, including pressurizer
pressure & level.
Can't work in present mode w/o
level ∴ procedure developed to
go water solid and vent su

227 309

HPSIS — don't know if RCP would be run — Astwick checking on status of procedure — NRC hasn't reviewed it yet

'crit'd — level indicator is in a more shielded position.

Warren Owen coming to trailer and to discuss strategy

primary pump OK, TCs OK

Personnel Side

Ross & Grimes favor rotation

Helps NRC safety expertise

People would go straight back to Op Center in Bethesda

Grimes & Ross could switch with Tedesco & Volmer

People here want to know how long they'll be here

Require at least as many as we have here now

12-12 cycle is good (really 10 on 10 off)

Israel & Novak could trade

Hannauer, Davis

Lowe

Should NRC have a focal point for the LEO mass advisory group (e.g. Ross)

NRC counterpart from SD to talk to Grimes

- licensee asked last night for help in decontamination — beyond their expertise — Joe Deal of DOE with HP consultants on the way to appraise the problem and see if DOE or DOD can help.

file queued ups

Summary of 4/6 day shift

@ ~ 9/6/79 ~ 9:10 pm

- Waste Gas Decay Tank transfer started about 11:00 am
- Agreed on NRC reps in controlroom
- Agreed on NRC organizational structure in Bethesda & Site
- RCP 1A tripped; 2A started.
- Prepared NRC manning profile for command, operations, and technical review. Prepared Denton Memo
- Ybarrondo on board & working for Ross
- Leak in Heise Gage fixed
- original Pz level transducer resurrected — others have noise, however.
- Ross Ordered 3 — Whole Body Counters
- Ross has Ybarrondo pulling all nat'l lab work together in a tematic form by 4/7 a'm.
- IRS — coming Monday

file general info

4/6 7:20 am

people into CR - need list - Novak

Jim Holman at IAG needs to communicate industrial waste pumped 1:30 - 3:30

2nd & 3rd level ⇒ instruments OK.

Heise Gage is leaking (elbow?)

* { B tank valve wouldn't open
  { A tank leaked. - will they now go to MUT and

hydrogen coming down in containment.

* confirm plans to spray Aux w/ ⇒ Sodium Hydroxide

transferred water to rad 2 - will tells us at

227 318

This table includes a number of assumptions about activity and weather. These assumptions have been chosen conservatively. In an actual release, the release rate and weather should be evaluated as they are at the time, and the decision based on those values.

Event - Spontaneous failure or decision to perform a potentially risky maneuver

Find out what actually happened and what is functioning.

Predict what could result - different likelihoods

Predict release rate

} In tables

Determine present weather and forecast — Assumed constant in table

Dose Prediction — In table

Action Guidelines — Per Appendix 7

	EVENT	EXPECTED PLANT RESPONSE (RANGE?)	RELEASE AND TIME	WARNING TIME	EVACUATION SCENARIO	WHO DECIDES
1.	Loss of vital function or decision to perform a potentially risky maneuver. Examples 1. Reactor Coolant Pump Trip. 2. Leak in Aux Building. 3. Loss of off-site power 4. Loss of feed-water 5. Depressurization to go on RHR.	Restore Function Within 1 hour	No significant change		None*	
		Switch to Alternate Function involving Pri Coolant in Aux Building	Small leak less than 1 gal/hour		None*	
			Large leak in Aux Building 50 gal/min	2 hour	Evac 2 miles Stay Inside ~~to~~ 5 miles	
		Failure to restore vital function	Core melt; see item 2 below & Appendix 1			

*For sufficiently risky maneuver, do precautionary evac 2 mi and stay inside 5 mi; whether to do this or not depends on details of maneuver and plant situation.

227 321

	EVENT	EXPECTED PLANT RESPONSE (RANGE?)	RELEASE AND TIME	WARNING TIME	EVACUATION SCENARIO	WHO DECIDES
2.	Core Melt	Maintain Containment Integrity (likely) with Containment Cooling	Tech Spec Containment Leak Rate	4 hour	Precautionary Evac 2 mi all around and 5 mi sector; stay inside 10 mi	
		Containment Breached	Reactor Safety Study Categories PWR 4 - See Appendix 1	24 hour	Evac 5 mi all around and 10 mi sector, stay inside 15 mi	
3.	Hydrogen Explosion Inside Reactor Vessel	No significant change in reactor or primary system	No significant change		None	
		Core Crushed (unlikely)	Core melt See Item 2 & Appendix 1			

APPENDIX 1 MAJOR SEQUENCES OF EVENTS

Major sequences evaluated here are tied to the loss of forced circulation in the RCS. The loss of flow from the reactor coolant pump (RCP) is the generalized initiating event from which other initiating events such as loss of offsite power can develop.

loss of PORV

APPENDIX 1.a SEQUENCES OF POSSIBLE SYSTEMS FAILURES

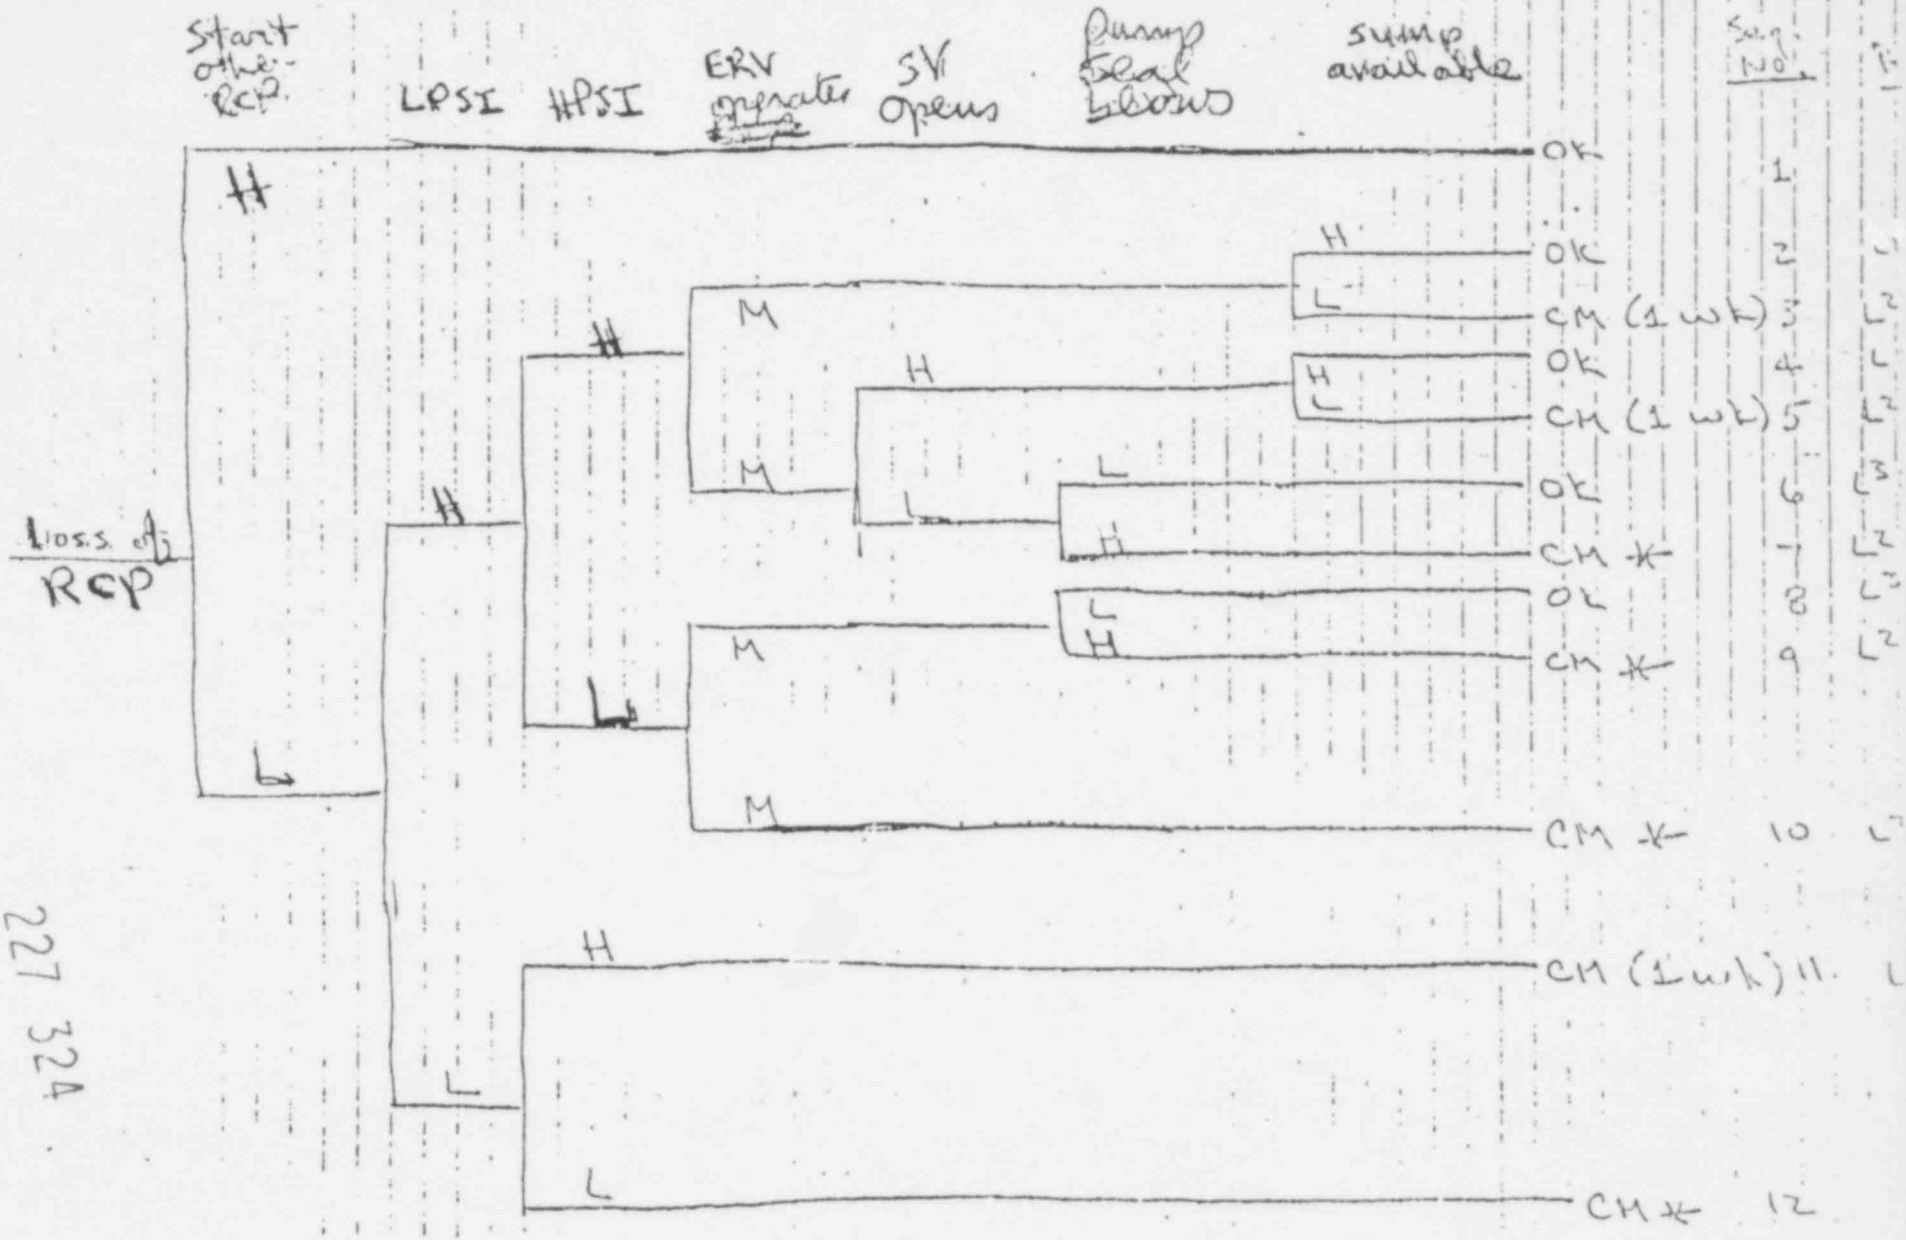
Figure 1.b-1 shows the loss of RCP event tree. This tree shows the various options available given the loss of the RCP, and indicates which combinations of events or failures would lead to core meltdown (CM). The sequences denoted with an asterisk are those which would be expected to follow the core meltdown progression discussed below, leading to the variety of atmospheric radioactive releases and consequences discussed later. Some core meltdowns could be expected to be delayed for roughly a week because of the availability of ECC injection over that period. This method of core cooling, however, is not expected to be adequate to prevent core melt; as such a core meltdown is assessed to occur at roughly a week. A rough measure of relative probabilities of the various outcomes is indicated by the notation of L, M, H (low, medium, high). The column on the right-hand side of the page indicates the relative probabilities of the sequences, with "LM" as the highest probability and L^3M as the lowest.

Sumps because unavail. DSS/DCR agree in a week we could get around this but release would be next because of decay in S/B bldg.

3 sequences lose sump 1 sequence loses EFW assume standard not effective — it helps it we do it, adds conservatism

Fig 1.b-1

Loss of Reactor Coolant Pump



APPENDIX 1.b

MAJOR EVENTS AND TIMING IN EVENT OF CORE MELTDOWN

Event 1 - Sprays and Coolers Operative

Time=0 Flow stops, core and water start heat-up

Time=100 min Core starts to uncover

Time=150 min Core begins to melt

Time=200 min Molten core is in lower head of reactor vessel, pressure is 2500 psia

Time=210 min Reactor vessel fails, containment pressure goes to 25 psia

Time=210 min Hydrogen burns, containment pressure goes to 67 psia
Steam explosion possibility - minor consequence

CONTAINMENT SURVIVES (Failure assumed 130 psia)

Time=10 hours Molten core has melted about 1 meter into basemat

Time=days Major problem - handle hydrogen, oxygen - maintain containment integrity

CAUTION:
- Keep sprays running
- Keep water many feet over molten debris
- WITHOUT RECOMBINERS Hydrogen continues to build up

BASEMAT SURVIVES

Event 1 Conclusion: This event should not produce major releases

Event 2 - Sprays and Coolers Failed Before Flow Stops

Time=0 to Time=210 min Same as Event 1 - containment pressure is 25 psia

Time=810 min Containment pressure is 70 psia

Time=1 day Containment fails due to steam (mostly) overpressure - about 135 psia

CONTAINMENT FAILS

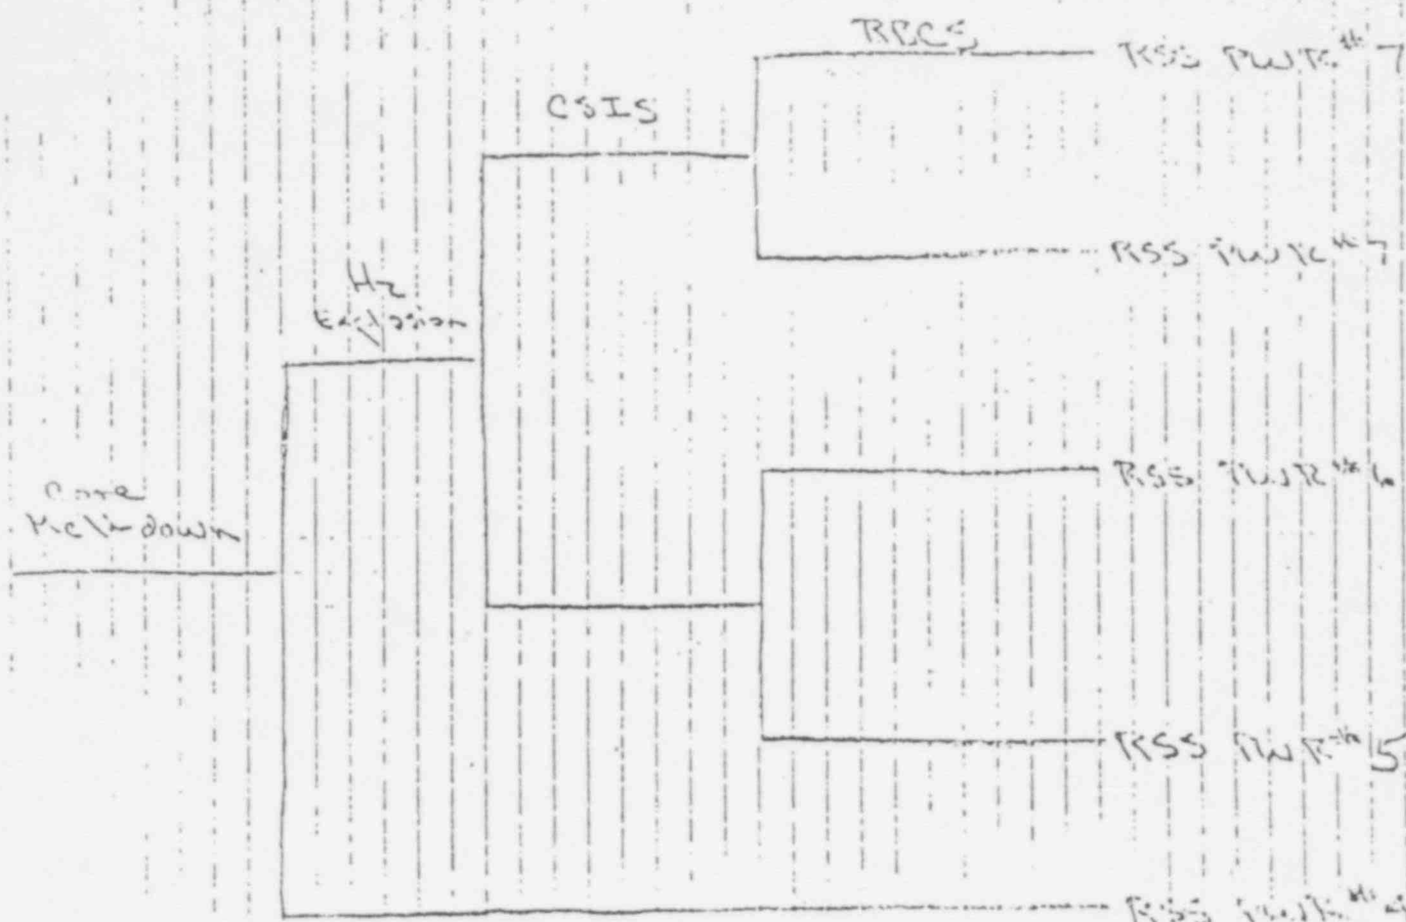
Event 2 Conclusion: This event leads to major releases.

227 325

The event tree for core melt leading to various releases is shown in Figure 1.b.

The following are essential in the event of core melt.

1. Sprays and coolers are required to prevent major releases.
2. Hydrogen must be recombined or otherwise removed from containment.



Core Meltdown
H2 Explosion

RRCS
RSS PWR #7
RSS PWR #7
RSS PWR #6
RSS PWR #5
RSS PWR #4

FIGURE 1.b

1c. Large Leak in Auxiliary Building (AB)

The activity level in the reactor coolant is so high that substantial releases can come from small amounts spilled in the AB which requires once through ventilation. A leak of 5 gpm to the AB atmosphere is assumed for the expected level of leakage. A leak of 50 gpm is taken as a large leak to consider a major leak in pump shaft sealing or some similar mishap. Based on the leakage experienced already only the noble gases and no iodine are assumed to evolve. The AB ventilation exhaust is assumed to flow through the charcoal filters.

1d. Hydrogen Explosion in Reactor Pressure Vessel

A detonation of the hydrogen oxygen bubble in the reactor vessel could rupture the vessel and/or crush the core. Rough analysis indicates that the pressure vessel would not rupture. Postulation of the core response is difficult. If the core is crushed, it could effectively prevent core cooling leading directly to the core melt sequence described earlier. It is unlikely that compression would lead to criticality.

Action Alternatives	Evacuation	Stay Inside
1.		2 miles
2.	2 miles	5 miles
3.	2 miles all around 5 miles 90° sector	10 miles
4.	5 miles all around 10 miles 90° sector	15 miles

a. All sector choices governed by wind direction. If shifting, more than one quadrant may be affected.

b. These are initial values; as the release continues measurements may indicate the need for reconsideration of action up to 20 miles.

6. Weather

The table is based on F stability and 1 m/sec wind speed, in view of the April 1-3 forecast. At the approach to decision time for evacuation, the appropriate met. condition will be factored into the dose equations to determine the evacuation time, sectors, and distances for the evacuation.

NRC is predicting X/Q for current meteorology as the incident progresses.

7. Action Guidelines

a. Notify evacuation authorities two hours in advance to standby for a possible evacuation.

b. Predicted doses of 1R whole body or 5R thyroid in 8 hours - mandatory evacuation of children and pregnant women.

c. Predicted doses of 5R whole body or 25R thyroid in 8 hours - mandatory evacuation of all persons.

Assumes general warning already that some form of evacuation may become necessary.

227 ~~340~~
339

FLIGHT 3/28/79-1F SHIPMAN/WATSON TIME: 1600-1700

East edge of the plume was at Hummelstown, west edge at Rutherford Heights. Levels were about 0.2 mr at 7 miles north of plant. 0.1 mr at 16 miles north. Plume extended at least as far as the ridge to the north of Harrisburg. Flown at 150 to 1000 feet. No change in count rate.

FLIGHT 3/28/79-2F SHIPMAN/WATSON TIME: 1900-2000

East edge of the plume was at Rutherford Heights. West edge was at Camp Hill. Levels were slightly lower. Top of plume was at about 3000 feet.

FLIGHT 3/29/79-1F SHIPMAN/WATSON TIME: 1000-1100

West edge of the plume was at Mechanicsburg. East edge was at Hershey with the maximum at a point about 2 miles west of the river. The top was at about 3200 feet, the max at 2100 feet and the bottom at 500 feet.

FLIGHT 3/29/79-2F SHIPMAN/WATSON TIME: 1600-1700

The east edge of the plume was at Hummelstown. The west edge at Mechanicsburg at 10 miles. The maximum was about 0.2 mr. Near Hummelstown the top of the plume was at 1200 feet, the maximum at 1000 feet, and the bottom

at 800 feet. The plume/cloud to the north of the plant appeared to be dissapating and a new plume was forming to the south. At 1/2 mile south at 500 feet, the highest level was 0.5 mr. At the site boundary to the south at 500 feet the levels were 10 mr.

FLIGHT 3/29/79-3F SHIPMAN/TIPTON/EICHER TIME: 0700

Circled plant at a distance of 8 miles. Saw no plume; only residules of about 100 ~~micror~~ μR/hr to northwest of airport.

FLIGHT 3/29/79-4F TIPTON/WATSON TIME: 2230-2330

Plume low and close to plant. Top at about 500 feet. Level at 1/2 mile of about 1/2 mr. Plume did not extend more than 5 miles from plant. Wind from 130 degrees at 8 knots. Ridge to northwest split plume with some trapped behind ridge and some going up river at very low altitude.

FLIGHT 3/30/79-1F MAGUIRE/WATSON TIME: 1030-1130

Maximum level of 20-30 mR at 300' altitude and 1/4 mile SW of plant. From 1/2 mile out plume is SE of plant. At 1 mile from plant highest levels are in the SW to the NNE. Approximate 0.5-1.0 mR/hr at SE. Top at 1 mile approximately 1500' altitude. Did not extend more than 5-6 miles in SE direction. At 1/4 mile 500' altitude 8 mR, WSW of plant.

FLIGHT 3/30/79-2F SHIPMAN/ZICHER TIME: 1600-1800

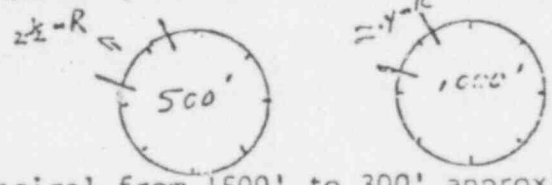
Plume is very narrow. Leaving plant on a bearing of 280 degrees. Hottest point near ground. Top at 1200'.

DISTANCE FROM PLANT (Mi)	Mr
1	9
1.5	8
2	8
2.5	8
3	7
3.5	4
5	2

Predominently up river valley.

FLIGHT 3/30/79 TIPTON/WATSON TIME: 2130-2230

Flew a circle around the plant at 1 mile out at 500' altitude and 1000' altitude. Cloud approximately 30degrees-40 degrees wide going to the NW. Maximum reading approximately 1/2 mR (with scintillation counter)



Flew altitude spiral from 1500' to 300' approximately 3 miles from plant at a heading of 330 degrees. Entered the cloud at approximately 1000', maximum at approximately 500', decreasing down to 300' where had to level off.

Flew a radial at a heading of approximately 330 degrees out from th
Seeing levels varying from 100 to 200 /hr all the way out, 18 mil
plant until broke off line due to ridge. Radial flown at 500' altitude.

Flew half circle at distance of 5 miles out from plant. Still approximately 30-40 degrees wide. Altitude 500'.

227 342

FLIGHT 3/31/79 TIPTON/WATSON TIME: 0015-0105

Perform a circle around the plant at 1 mile out at 500' altitude, and 1000' altitude.

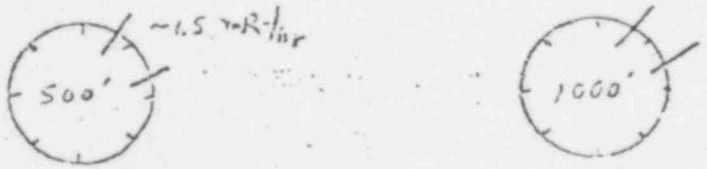
Wind out of 240 degrees

Flew a radial at 500' altitude in a direction of approximately 020 degrees out for 18 miles before breaking off. Did not run out of the plume. Levels were about 100 μR/hr along the path of the plume. Measured approximately 20 degrees angular spread out at 18 miles as did at 1 mile.

Did an altitude spiral about 6 miles out from the site in a direction of 020 degrees from 1500' to 300'. Entered the cloud at 800'. Continued to increase all the way down to 300' where had to level out. Maximum reading at 300' was 150 μR/hr.

FLIGHT 3/31/79-2 MAGUIRE/EICHER TIME: 0300-0400

Flew a circle around the plant at 1 mile out at 500' altitude and 1000' altitude.



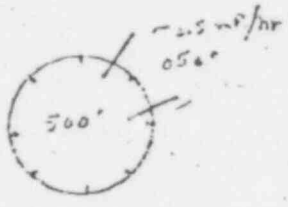
Wind out of 245 degrees (25 knots) @ 500' alt.

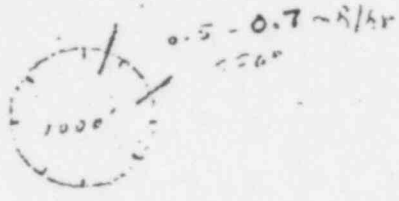
227 343

Flew a radial at 500' altitude in a direction of approximately 060 degrees out for 20 miles. Plume extends past 20 miles. Narrow cone (approx. 5 degrees) at 14 miles had levels of 100-200 μR/hr.

Flew altitude spiral at 2.5-3 miles out in a direction of 060 degrees from the plant. At 1100'-1500' altitude ~20 μR/hr - 700' - 1100' altitude 30 μR/hr. Sharp top between 600' and 700'. Levels rise to approximately 1 mR between 600' and 700' altitude. Stay constant down to 200' altitude.

FLIGHT 3/31/79 MAGUIRE/EICHER TIME: 0600-0715





Ground winds 8 knots @ 245 degrees

Flew out along 050° radial. Levels dropped from 1 mR/hr at approximately 1.5 miles out and dropped to 100-200 μR/hr at 13 miles. Levels stayed constant out to 30 miles from the plant. Top of plume is sharp at 600'. 100-200 μR/hr levels were present to the ground. Width of plume appeared the same at 4 miles out and 20 miles out (approximately 2 miles wide).

All along plume top appeared at 600' with constant levels from 0-500' altitude.

FLIGHT 3/31/79 SHIPMAN/WATSON TIME: 0900-1000

At 1 mile and 600' plume was between 030 and 060 with maximum at 045 of 3 mR/hr. At 1 mile and 1100' plume was between 030 and 060 with maximum at 045 of 0.5 mR/hr. At 3 miles in center of plume top was at 800 feet and went to ground level. Dose rate nearly constant throughout valve of 1 mR/hr.

227 327 344

At 3 miles plume was from 030-050 radial away from plant on 045 was 3 mR/hr out to 2 miles, 2 mR/hr at 3 miles dropped to 1 mR/hr by 10 miles.

Followed plume to Myerstown, about 22 miles where the level was about 0.1 mR/hr.

FLIGHT 3/31/79 SHIPMAN/WATSON TIME: 1215-1330

No major change. No I^{31}. Plume at 500' and 1 mile between 030 and 060 maximum value of 1.5 mR/hr. At 3 miles plume between 030 and 060 maximum value of 1.5 mR at 300' top of plume at 2800' bottom on ground. At 10 miles maximum value of 0.2 mR/hr maximum at 1800'.
