UNITED STATES OF AMERICA  
NUCLEAR REGULATORY COMMISSION

Public Meeting  
DISCUSSION OF NUCLEAR POWER NEEDS OF  
PENNSYLVANIA-NEW JERSEY-MARYLAND

Room 1130  
1717 H Street, N.W.  
Washington, D.C.

Thursday, 14 June 1979

Meeting in the above-entitled matter was convened,  
pursuant to notice, at 3:15 p.m., JOSEPH M. HENDRIE, Chairman,  
presiding.

PRESENT:

JOSEPH M. HENDRIE, Chairman

VICTOR GILINSKY, Commissioner

RICHARD KENNEDY, Commissioner

PETER BRADFORD, Commissioner

JOHN AHEARNE, Commissioner

Messrs. Smith, Feehan, Price, Everett, Eckert

Lindsay, Haines, Fowlkes, and Hoyle.

CHAIRMAN HENDRIE: Let's see, the second group of briefers headed by Mr. Robert Smith, Chairman of the Public Service Gas & Electric.

Please bring up whomever you would like to have at the table and introduce them for the record, please.

Go head.

MR. SMITH: Good afternoon, gentlemen. I am Robert I. Smith, Chairman, Chief Executive, Public Service Electric & Gas Company.

I am here this afternoon as the representative of the Pennsylvania-New Jersey-Maryland interconnection and the owners of Salem.

With me at the table, on my far right, John Feehan, Chief Executive of Atlantic City Electric.

Next to him, Bill Price, who is Vice President, Generation Delmarva Power & Light Company.

On my left, Lee Everett, Chief Executive Officer of Philadelphia Electric Company.

Next to Lee, Dick Eckert, our Senior Vice President, Public Service, of Energy Supply & Engineering.

In the audience we also have John McDonald, who is our Senior Vice President of Governmental Affairs, Public Service.

Also Richard Fryling, our Assistant General Solicitor

281 325

~~281 327~~

mm3

1 From Philadelphia Electric, Vincent Boyer, Senior  
2 Vice President.

3 And I might also mention the President of our  
4 New Jersey Board of Public Utilities George Barbour wanted to be  
5 here today. He was unable to do so. But I understand that a  
6 letter --

7 CHAIRMAN HENDRIE: He is represented by a letter to  
8 the Commissioners.

9 MR. SMITH: Fine.

10 Our purpose here today is to discuss the power  
11 supply situation of the Pennsylvania-New Jersey-Maryland  
12 connection with specific reference to Salem No. 2.

13 I think the gentlemen from the Department of  
14 Energy have described the interconnection so that it is  
15 unnecessary for us to do that. And I think we can say that  
16 we agree with them that our reserves during this coming  
17 summer will be adequate.

18 However, the costs of that supply are up in part  
19 because of the Three Mile Island accident and removing those  
20 two units from the system, and of course the continuing  
21 increase in the cost of fuel oil is directly affecting our  
22 customers.

23 Of prime concern to us is the operation of Salem  
24 No. 2. I don't think I have to describe the unit. You are  
25 familiar with it. It is 1100 megawatts Westinghouse Unit. It

mm4

1 is owned by the four companies here represented; Public  
2 Service and Philadelphia Electric each own 42 percent, and  
3 Delmarva, Atlantic City Electric each own 8 percent.

4 A recent NRC announcement indicates that the present  
5 intent is to delay, at least until August 1st, the operating  
6 license of Salem 2, and that is of importance to us.

7 We believe that Salem No. 2 is essentially ready  
8 for operation. Construction is complete, testing is complete  
9 up to the core load. And as we understand it, all modifications  
10 required by the NRC to date have been completed.

11 Our field people tell us that they believe that the  
12 Region 1 inspectors are satisfied the plant is ready for an  
13 operating license.

14 The review by the NRC Staff in Washington is not  
15 quite complete, but there are very few outstanding items.  
16 We believe that these can be resolved in a very short period  
17 of time.

18 The primary difference between Salem 2 and the  
19 operating nuclear unit on the system is that about a five-  
20 month test program is going to be required before commercial  
21 operation of Salem 2, after we receive the operating license  
22 and the plant, of course, is not presently radioactive.

23 In focusing on the Salem 2 operating license, I  
24 would like to briefly discuss four aspects of the Salem delay.

25 First, with regard to load carrying ability on

281 327

~~281 329~~

mm5

1 the system, I think that subject has been adequately discussed  
2 with regard to reserve capacity. However, within the  
3 Southern part of New Jersey we could be tight on voltage  
4 requirements during peak days.

5 Even with a low output from Salem 2, having the  
6 unit synchronized with this system, would give us the  
7 voltage stabilization which would be advantageous for possible  
8 peak loads in September.

9 Obviously --

10 COMMISSIONER AHEARNE: What period did you say  
11 would be a problem in handling the voltage stability?

12 MR. SMITH: Where it could be.

13 COMMISSIONER AHEARNE: In what period did you say?  
14 Summer?

15 MR. SMITH: Peak in September. We occasionally  
16 have peaks in that system in September. Obviously this unit  
17 can't be ready for June and July peaks. But, if it could even  
18 be on-line and synchronized, it could be of help in late  
19 September.

20 COMMISSIONER BRADFORD: When does your system  
21 experience its peak?

22 MR. SMITH: We have had peaks in June and in  
23 September.

24 COMMISSIONER BRADFORD: Its annual peak?

25 MR. SMITH: Yes. Oh, system peak. I am talking

mm6

1 about our company peak.

2 It varies with the different companies. PJM's  
3 peak has been during the summer months. But we have had peaks  
4 in June. Ours has been, peaks also in September.

5 COMMISSIONER BRADFORD: But the peak -- PJM system  
6 peak is generally July, August?

7 MR. EVERETT: Corresponds to hot weather. Whenever  
8 we have hot weather in the summer we have a peak.

9 MR. SMITH: Actually, a lot of industries are  
10 shut down during the summer months, so we have reduced  
11 operations.

12 You are liable to have a peak in June if you have  
13 a hot day, or September, if you have a hot day, because  
14 they are normally -- it is not during their normal vacation  
15 period.

16 COMMISSIONER BRADFORD: Do you know offhand how  
17 many years in the last 25 years, the annual peak has occurred  
18 in either June or September?

19 MR. SMITH: I do not have that information.

20 MR. EVERETT: Since about 1965, '66.

21 COMMISSIONER BRADFORD: Every year?

22 MR. EVERETT: Every year.

23 COMMISSIONER BRADFORD: Either June or September?

24 MR. EVERETT: We have a substantial difference

25 between winter and summer peak.

mm7

1 COMMISSIONER BRADFORD: I am talking about June  
2 or September versus July or August.

3 MR. EVERETT: It is impossible to say when during  
4 the summer season we will get the hot weather. It usually  
5 takes three or four days of very hot humid weather to develop  
6 the saturation of heat that causes the air conditioning peak.

7 But, as Bob said, it could be in June or September  
8 with perhaps weather that is not quite so hot because of  
9 industry going full tilt.

10 COMMISSIONER AHEARNE: But the question was going  
11 back the last 25 years.

12 MR. EVERETT: I don't have a list.

13 MR. FEEHAN: September 23rd is burned in my memory.

14 (Simultaneous discussion.)

15 MR. SMITH: Let me point out, the two major  
16 problems we have had on our system, one occurred in June and  
17 one occurred in September.

18 MR. ECKERT: Big outages. They weren't during the  
19 peak.

20 (Laughter.)

21 COMMISSIONER BRADFORD: And were they because of  
22 a shortage of capacity?

23 MR. ECKERT: No.

24 MR. SMITH: It was a shortage of capacity in  
25 September.

nan8

1 MR. EVERETT: It was brought on by a shortage,  
2 but it wasn't as a direct result of an inadequate ability  
3 to serve at that point. It was brought on by units not  
4 coming on when scheduled, and therefore having to rearrange  
5 transmission lines in order to cope with the reduced capacity.  
6 And the lines weren't arranged so that they were reliable  
7 enough. And when an operating error happened, why it  
8 cascaded on the system.

9 MR. SMITH: I think the people from DOE have also  
10 indicated that a major portion of our generation, about 20  
11 percent is nuclear. So, obviously, we need nuclear capacity  
12 on our system to maintain operations.

13 So, if for any reason the thought was occurring to  
14 anybody to shut down nuclear plants on our system, we would  
15 be in deep trouble.

16 With regard to the economics, again, there has  
17 been quite some discussion on the fuel cost differential  
18 and the net results to the customers. With Salem at 100  
19 percent capacity, our figure is \$600,000 a day. This is  
20 not out of line with the DOE figure which I think was  
21 \$400,000 some odd, on the basis of 70 percent capacity  
22 factor.

23 COMMISSIONER AHEARNE: But you would never be  
24 running at any length of time at 70 percent capacity, would  
25 you?

mm9

1 MR. SMITH: We hope we do.

2 COMMISSIONER BRADFORD: Some year.

3 MR. SMITH: This is a scenario that can go on all  
4 afternoon.

5 CHAIRMAN HENDRIE: A 100 percent day is worth so  
6 much, and if you move off to longer periods of time since  
7 you aren't going to run every day, every hour at 100 percent,  
8 you grade down, and everybody choose his own guess at the  
9 reasonable annual plant factor and we will apply accordingly.

10 MR. EVERETT: These are monthly factors, I think.  
11 We are not talking about annual. There is a difference. We  
12 have had monthly capacity factors of our nuclear units over  
13 100 percent.

14 COMMISSIONER BRADFORD: But not, probably, during  
15 the startup period.

16 MR. EVERETT: These were mature units.

17 MR. SMITH: We used for our calculations, a 5 mil  
18 per kilowatt hour fuel cost for nuclear, and 25 mils for the  
19 oil, which are somewhat more conservative, I think, than  
20 the figures which DOE supplied.

21 I think the other factor that perhaps should  
22 enter into consideration of the capacity factor in Salem 2  
23 is that it is a duplicate of Salem 1, which we have had  
24 operating experience with. I think a lot of the problems  
25 that might have occurred with the first unit on the plant we

mm10 1 have taken care of, so I think there is a better chance of  
2 having higher capacity factor in Salem 2.

3           However, I think probably more important than the  
4 economics with regard to our customers is the saving in  
5 oil consumption which can be made by operation of this nuclear  
6 unit. Again this 100 percent capacity at the nuclear is  
7 equivalent to a saving of 45,000 barrels a day of oil.

8           And again, you can take however many days at what  
9 percentage capacity you want and use that 45,000 barrels a  
10 day figure to come up with an oil savings.

11           COMMISSIONER AHEARNE: Are you saying that from  
12 this system that you would definitely be using oil capacity  
13 to replace it?

14           MR. SMITH: Yes.

15           I think it has been pointed out that we operate  
16 in economic dispatch. We have examined the availability of  
17 capacity from adjacent systems. We are utilizing all the  
18 coal burning capacity in our own system. As a matter of  
19 fact we have more than this much oil burning on our system,  
20 but we just backed off that.

21           The investment in Salem 2 is \$700 million. Part  
22 of that is in construction work in progress in the rate  
23 base, but only a very small part of it. Maybe a third of  
24 that.

25           This unit, of course, is sitting there. It is a

mm11 1 \$700 million investment, nonproductive. It has got interest  
2 charges, of course, on the money. And it costs about  
3 \$1000 a month, just for standby service to keep the thing  
4 moving.

5 MR. ECKERT: A million dollars.

6 MR. SMITH: I'm sorry, a million dollars a month.

7 (Laughter.)

8 I could never talk in that long a number.

9 Now I think we all recognize that Three Mile Island  
10 was a very serious accident, and that following Three Mile  
11 Island all of us have been required to examine our nuclear  
12 operations.

13 Immediately after the accident we established a  
14 task force within the company to examine all the details of  
15 the accident. We referred them to our Salem designs to  
16 see what corrections or modifications should be made as a  
17 result of that investigation.

18 We have had 25 people full time working on that.  
19 We have added to that representatives from the other owners  
20 who are working with this task force. We anticipate that  
21 within the very near future we will have up to 60 people working  
22 full time on the design and investigation of some of these  
23 possible modifications.

24 We have worked with a Westinghouse owners' group  
25 which was assembled immediately after the accident, who

mml2 1 reviewed the Westinghouse design. Our people are active in  
2 the AIF task forces and also with APRI, again in examining the  
3 ramifications of the accident.

4 We are well along in finalizing design of some  
5 of the modifications. We have ordered equipment for some  
6 changes, and have actually accomplished a number of changes  
7 as of this date.

8 I have before me a 13-page list of items which we  
9 are working on; some of the things which we have concluded;  
10 have done the work on Salem 2 pressurizer logic change; alarms  
11 for the pressure operated relief valve; saturation indications  
12 in the computer which are given directly to the operator;  
13 and containment isolation in case of an accident. We do  
14 have positive containment isolation.

15 We are in the midst of design, have all the material  
16 for a reactor head vent system --

17 COMMISSIONER BRADFORD: When you say containment  
18 isolation, what would trigger it?

19 MR. SMITH: Any one of a number of factors.

20 MR. ECKERT: There is a lot of things that will  
21 trigger containment isolation.

22 COMMISSIONER BRADFORD: But that was true in Three  
23 Mile Island as well. The problem is having the right thing  
24 trigger it.

25 MR. ECKERT: We had to look at the logic as to just

mml3 1 when it would be triggered and when it wouldn't.

2 For instance, safety injection. I don't think  
3 that triggered containment isolation in TMI. It does for us.

4 CHAIRMAN HENDRIE: No, it didn't.

5 COMMISSIONER KENNEDY: But it does with you?

6 MR. ECKERT: This kind of thing. It is very complex,  
7 we realize, but that is an example.

8 MR. FEEHAN: It doesn't wait for the pressure to  
9 get to 4000 -- (Inaudible.)

10 MR. SMITH: Rate of water rise, reactor vessel  
11 level, things like that. We are engaged in designs and  
12 securing material.

13 COMMISSIONER GILINSKY: What are you doing about  
14 reactor water level?

15 MR. SMITH. We are working with Westinghouse, I  
16 think on that.

17 Dick?

18 MR. ECKERT: Yes, we have some preliminary designs,  
19 but we have some problems with those designs and they really  
20 have to be finalized at this stage.

21 CHAIRMAN HENDRIE: What is the aim here on this  
22 particular item? To try to get some indication down in  
23 the vessel, upper part of the vessel?

24 MR. ECKERT: Yes.

25 But it is a complex thing to do and the design has

mml4 1 not been completed. We haven't submitted anything to the  
2 NRC at the present time.

3 COMMISSIONER GILINSKY: You don't regard any of  
4 these things as being affected by the plant going critical?

5 MR. SMITH: Well, Salem 1 has been operating for  
6 two years. This is an identical design which we have already  
7 made modifications to, the things we are considering -- we are  
8 also planning to install in Salem 1 at the first opportunity,  
9 assuming the NRC approves the changes we have proposed.

10 MR. ECKERT: If you are concerned about the  
11 radiation field in installing some of these things, we  
12 looked at the two we think are most difficult to install, which  
13 is the vent system and the water level in the reactor. And  
14 we don't see either one of those requiring a lot of man hours  
15 being worked in the high radiation level.

16 We don't think it is very significant as to whether  
17 the plant has actually operated or not.

18 CHAIRMAN HENDRIE: What is your projection Dick, on  
19 when you shake out with Westinghouse on whether you really  
20 want to do those things or not, and how, exactly, you do  
21 them? Because you know there is a period of time here in  
22 any unit, of course, in the workup when you still have  
23 relatively modest radiation levels even in close. So there  
24 is some period of time.

Do you project that you are settling down on whether

201 337

~~201 339~~

mml5 1 you are going to do it or not, is it near term or months?

2 MR. ECKERT: From a radiation point of view, we  
3 looked at the radiation levels that exist on number one which  
4 has been operating, and we considered some of these designs  
5 and used those radiation levels. And that's what I mean,  
6 using those levels we did not have an excessive amount of  
7 radiation.

8 COMMISSIONER GILINSKY: What sort of numbers are  
9 you talking about?

10 MR. ECKERT: Give me a minute.

11 COMMISSIONER GILINSKY: Surely.

12 MR. SMITH: I think what we are saying is we  
13 have divided some of these into short-term and long-term.  
14 Some of these are going to take maybe years to work out the  
15 designs and changes, develop specific designs and get the  
16 material.

17 Some of the valves we ordered have fairly long  
18 lead time, so that we will be accomplishing all of the things  
19 we can accomplish short-term, within a very short period of  
20 time.

21 MR. ECKERT: In response to your earlier question,  
22 the vessel vent system, if indeed the final design in  
23 Salem is a preliminary design, and please understand that  
24 qualification, we would see a total manrem exposure of about  
25 4 manrem.

mm16

1           On the level instrumentation I have a radiation  
2 level in which men would work, but I don't have the man hours  
3 involved in it.

4           Talking about work on the reactor head, which runs  
5 75 to 100 mr per hour. Hotleg connection, which is 100 to  
6 300 mr. And some work in the bottom of the vessel, which  
7 is again 100 to 350.

8           This vessel level design is not as firm in our  
9 minds as the vent design. So I would say those numbers  
10 are more in question --

11           COMMISSIONER AHEARNE: And even the design that  
12 you have there, roughly what kind of hours are you talking  
13 about for that installation?

14           MR. ECKERT: On the vent design --

15           COMMISSIONER AHEARNE: No, on the pressure level.

16           MR. ECKERT: What kind of man hours?

17           COMMISSIONER AHEARNE: Yes.

18           MR. ECKERT: I don't have that number with me.  
19 But obviously the full intent would be to prefabricate  
20 everything ahead of time, do nothing more than make a few  
21 cuts. Probably in the area where the incore thimbals come up  
22 into the seal room. It is a radiation area, but it is not  
23 so high that you can't put people in it for direct work.

24           COMMISSIONER AHEARNE: You don't have a tap already  
25 on say the hotleg?

mml7

1 MR. BECKERT: Well, we have -- the hotleg, well  
2 we have vents, drains, things of that nature. That is a  
3 difficult thing to design because you have to look at the  
4 velocities, the water that is going in. That is the hard  
5 part is the top tap, not the bottom tap.

6 The bottom tap you can do in the seal cable area.

7 MR. SMITH: The other area of investigation  
8 prompted by Three Mile Island is, of course, operator  
9 training. We have reviewed our operator training.

10 We have always had an extra shift on operations  
11 at Salem 1, and will have on Salem 2. This extra shift is  
12 essentially in training during the off periods. They also  
13 provide backup, vacation and absences by other shift members.  
14 But we have provided continuous training of our operators.

15 We have been working with the industry and the  
16 AIF particularly have a task force working in operator training  
17 and we endorse their proposal to establish a nuclear opera-  
18 tions institute which will essentially be a quality assurance  
19 institute for operators in such an area where it is demon-  
20 strated that we do need continuous high-level operator  
21 training.

22 In summary, we see Salem 2 as a duplicate of  
23 Salem 1 with some modifications already made as a result of  
24 the Three Mile Island incident.

25 We would urge that you consider expediting the

281 340

~~281 342~~

mm18

1 Salem 2 license because of not only the economic benefits, but  
2 the savings in oil which will result. We feel that this can  
3 be done without compromising safety at all.

4 And that is our presentation.

5 COMMISSIONER GILINSKY: Could I ask you, are you  
6 saying that the things our Staff wants to have done can be  
7 done more quickly, or that they don't need to be done before  
8 the plant goes into operation? In effect, they are operating  
9 out of an excess of caution?

10 MR. SMITH: Well, I think we have responded to all  
11 of the bulletins that have been issued. I'm not sure that  
12 we all know what things the Staff wants to be done yet.

13 However, Salem 1, as I said, is an operating unit.  
14 As far as I know we are not talking about shutting those  
15 units down. We have made modifications to Salem 2. We will make  
16 any other modifications that are considered to be necessary.

17 COMMISSIONER GILINSKY: You have to start somewhere,  
18 though, and it is natural to start with plants that haven't  
19 started up yet. So they are, naturally, treated differently  
20 than plants that are operating, just as you would treat a  
21 plant that is not yet constructed more differently.

22 But what I am trying to get at is, what is your  
23 view about the position of our Staff, which seems to be what  
24 is in issue here?

25 MR. SMITH: Well, the public indication has been

mml9 1 that the license will be delayed until August 1st.

2 I think a different way of stating might be,  
3 at least until August 1st.

4 We are concerned that this thing will drag out.  
5 And you can argue about whether it is \$600,000 a day or  
6 \$300,000 a day, but it is still a tremendous amount of money.  
7 And we think it is in the national interest to reduce the  
8 burning of oil, and this 45,000 barrels a day I think  
9 represents about 10 percent of the national shortfall.

10 COMMISSIONER BRADFORD: But the 45,000 barrels a  
11 day --

12 MR. SMITH: But that is going to come sometime.  
13 Maybe October or November, if you start now.

14 MR. ECKERT: A delay in the startup will do nothing  
15 more than move a whole block of work further out in time.

16 (Simultaneous discussion.)

17 MR. ECKERT: So it means very little if you are  
18 replacing it in September, October, November, or the next  
19 three months. We will still have a net difference.

20 MR. EVERETT: You never mak up a lost day in our  
21 business.

22 COMMISSIONER GILINSKY: Let me ask my question  
23 again.

24 Are you asking that the plant be turned on for  
25 approved operation today, or simply that we take these

mm20 1 important matters into account as we go down the road and  
2 review what needs to be done?

3 MR. SMITH: I think we can ask you to authorize  
4 the plant to be turned on today. But I am sure that you  
5 have the final say in this. You will have to, in your considered  
6 judgment decide whether the plant should be kept off for  
7 another three months, four months or six months.

8 I think all we presented today is what we see as  
9 the consequences of delay.

10 CHAIRMAN HENDRIE: I think the Staff has been  
11 working to gather up and sort out what they believe are  
12 the short-term steps that ought to follow from Three Mile  
13 Island, in addition to the ones represented by the bulletins  
14 already issued.

15 And it would be my hope that we could develop  
16 those in fairly straightforward fashion pretty quick now. The  
17 work has been going on for several weeks. And then see how  
18 fast -- look at your list of things you are already doing and  
19 see how those things are coming along and how soon they might  
20 be implemented and what is reasonable to do, and look at it  
21 from that standpoint.

22 I don't, for myself, regard us as being in some  
23 mode where we have just shrugged and said, well, no we  
24 are not considering anything this season, try us next  
25 winter. I don't perceive it that way in any sense.

mm21

1 And I think it would be useful for us perhaps to  
2 have some indication of the direction you are going. The  
3 Staff will certainly want to go over these in detail pretty  
4 quick any way. Among other things, I think there is  
5 considerable interest in things like that vessel level  
6 indication, and about whether in fact the analyses would  
7 support one's sort of first reaction which was, well, gee,  
8 that seems like a pretty good idea, why don't we do that.

9 But, I would like some sense that it would ultimately  
10 be useful in at least some cases, and as people who have  
11 some experience around water -- around boilers know, liquid  
12 level, a two-phase system is very good.

13 It is a pity we have to measure it.

14 MR. ECKERT: Particularly a dynamic system.

15 CHAIRMAN HENDRIE: Yes.

16 So, you know, it is not just a transparently  
17 simple situation where even the meanest intellect will  
18 arrive at the right solution on casual observation. And I  
19 am sure the Staff will be interested, and I will be interested  
20 in some of the analyses. But I think it would be helpful if  
21 those were available.

22 Let me ask a question that may lead us into a  
23 little different line of discussion:

24 Salem 1 is operating. There is an emergency plan  
25 for the site?

mm22 1 MR. SMITH: Yes.

2 CHAIRMAN HENDRIE: Emergency planning is obviously  
3 one of the significant items of discussion that follows from  
4 Three Mile.

5 I guess Jersey does have --

6 MR. SMITH: We were one of the five states, I  
7 understand, that has a plan which has been concurred in by  
8 the Commission.

9 COMMISSIONER AHEARNE: Twelve states.

10 CHAIRMAN HENDRIE: Something like twelve.

11 But do you know offhand how far offsite your  
12 own emergency plan reaches in terms of contact with local  
13 emergency group leaders and so on?

14 MR. SMITH: I don't have the details with me.

15 What I can tell you is that following the Three  
16 Mile Island accident, the Superintendent of State Police  
17 called representatives of the utilities in New Jersey  
18 together with the Department of Environmental Protection which  
19 had the basic responsibility for drawing up the plan. Called  
20 us down to Trenton to review the Three Mile Island incident.

21 As a matter of fact, New Jersey sent a couple of  
22 state policemen over to the Harrisburg site, who reported  
23 directly back to Trenton.

24 They are reexamining all the details of their  
25 emergency plans, and there may be some proposed modifications

mm23 1 in those plans as a result of that examination and as a  
2 result of the experience at Three Mile Island.

3 We do have a whole series of people to call from  
4 the station and we are now getting state police even more  
5 involved. They appear to want to take the principal role  
6 in the administration of this plan. They want to be called  
7 first now. They want to know now also any event that occurs,  
8 whether it is an emergency event or not; they want to know  
9 when the plant is shut down, when it comes on line-. So they  
10 have taken a very active interest in the whole operation.

11 MR. ECKERT: Perhaps another response to your  
12 question as far as distance is concerned, the first town is  
13 I think, about 4 1/2, 5 miles away. And it is a small town.  
14 But they are involved in the emergency plan. How much further  
15 out than that it goes, I don't know. The next town is out  
16 between 8 and 10 miles. Very isolated there.

17 MR. SMITH: The police, Dick, are going to all  
18 the towns in the surrounding area, visiting them, since  
19 Three Mile Island and are reenforcing the whole evacuation  
20 plan.

21 CHAIRMAN HENDRIE: John?

22 COMMISSIONER AHEARNE: Well, I want to ask either  
23 Bill Lindsay or Frank Haines on the question of the  
24 stability of the grid.

25 Do you people look at that issue? And, if you

281 346

~~281 348~~

mm24 | have, do you have any comments?

2           MR. LINDSAY: We have looked at it a little bit  
3 from the standpoint that was mentioned here, namely that  
4 under certain light load conditions -- there is a lot of  
5 coal-fired generation in the western part of PJM, and  
6 of course light-load -- while in heavy-load conditions much  
7 of that is being used there, but as total load conditions fall,  
8 more of that is shifted to the East.

9           And so, under conditions of light load, it appears  
10 that there is a possibility of voltage control problems  
11 arising in the absence of more generation in the East, which  
12 is an economic problem because it could be replaced with oil  
13 and has to be.

14           MR. ECKERT: That may be a new problem we have to  
15 worry about, because it is not what we were referring to.

16           MR. SMITH: That is part of it, though.

17           MR. ECKERT: That is part of it. The very heavy  
18 loads, however, with outages in the southern part of the  
19 state, both transmission and an outage from closing Salem 1  
20 under a worst condition, could get into a low load situation  
21 in the southern part of the state. And I think that is what  
22 Bob was referring to, not a low load.

23           CHAIRMAN HENDRIE: Frank, you had a hand up.

24           MR. HAINES: I simply wanted to observe that  
25 yesterday we went and looked at the transmission system and

mn25

1 it is on the 500 kv ring that they have. It has a major  
2 generating ring that goes around their load and it is right  
3 on it.

4 COMMISSIONER AHEARNE: Another question to either  
5 of the two of you.

6 The State of New Jersey, as well as the company  
7 has just indicated an estimate of 500,000 barrels of oil,  
8 so this is roughly 10 percent for national use, and this is  
9 roughly 10 percent of that. Does that sort of jibe with  
10 your numbers?

11 MR. HAINES: (Nodding affirmatively)

12 MR. LINDSAY: Yes, sir, it does.

13 MR. ECKERT: The 500,000 barrel figure was  
14 quoted by Stuart Eizenstat.

15 COMMISSIONER AHEARNE: 45,000 is a 10 percent  
16 level -- is at 100 percent capacity level. So I was  
17 wondering what the 500,000 is. A similar --

18 MR. ECKERT: That is a net --

19 COMMISSIONER AHEARNE: But that is a real number  
20 as opposed to 100 percent is a theoretical upper bound.  
21 And that is really what I was trying to ask.

22 MR. FOWLKES: Excuse me. The numbers that I  
23 got from PJM indicated the 45,000 barrels a day was based  
24 on an 80 percent operation of Salem No. 2. That is what  
25 I was told.

mm26

1 COMMISSIONER KENNEDY: Would you go over that  
2 again?

3 MR. FOWLKES: The 45,000 barrels a day shortfall --  
4 not shortfall, but increased usage without Salem No. 2, it  
5 was indicated to me that that was based on an 80 percent  
6 operation for the Salem No. 2 unit, capacity factor I'm  
7 talking about now.

8 MR. SMITH: Our number is more conservative.

9 MR. ECKERT: I am sure the 45,000 by our numbers  
10 is with 100 percent capacity.

11 MR. SMITH: There are two other factors which I  
12 didn't mention, which perhaps have some bearing.

13 One is that -- and I know this -- Public Service  
14 has a responsibility for engineering design construction  
15 of Salem 2. We have our own in-house engineering staff  
16 that did that. So all the people who have direct relation to  
17 that design are in house and always available. We are not  
18 depending on some architect-engineer who has maybe three  
19 or four other plants to worry about, to look into some of  
20 these things on Salem.

21 The other thing which I think is public information,  
22 GPU has contracted with Philadelphia Electric for Philadelphia  
23 Electric's share of the Salem 2 output, so you have got a  
24 situation here where GPU would actually be helped if Salem 2  
25 was in service.

mm27 : MR. EVERETT: For about 8 to 10 years.

2 COMMISSIONER AHEARNE: Would that be all?

3 You are saying Philadelphia Electric doesn't  
4 really need --

5 MR. EVERETT: The capacity at this time.

6 And with other changes in our system, completion  
7 of Limerick 1 and 2, we won't need this capacity for about  
8 8 or 10 years.

9 COMMISSIONER AHEARNE: Just to make sure I have  
10 that --

11 CHAIRMAN HENDRIE: What is the state on Limerick 1?

12 MR. EVERETT: It is about 50 percent complete as  
13 far as construction is concerned.

14 COMMISSIONER AHEARNE: It had been several numbers  
15 of reserve margin, but I gather without trying to get involved  
16 in which number is the accurate one, I think you mentioned  
17 that even without Salem this summer you are going to have  
18 a --

19 MR. SMITH: We couldn't argue the case on the  
20 basis of lack of capacity.

21 MR. EVERETT: We have been concerned with the  
22 possibility of a shortage in number 2 oil, which we use  
23 for peaking, combustion oil. And our suppliers have offered  
24 us none on the spot market. We do depend occasionally on the  
25 spot market for purchase of that type of oil, so we have

mm28 1 curtailed the use of those kinds of machines during peaking  
2 so far, but we really haven't had any peaking weather at  
3 this point in the summer.

4 So that one could go either way. If we cannot use  
5 the combustion turbines or must limit their use, then we  
6 may have a larger problem than we think at the present time.  
7 That's about all we can say.

8 COMMISSIONER BRADFORD: So, the power pool  
9 presumably establishes some sort of capacity responsibility  
10 for each of the companies within it. As of what date does  
11 the power pool presently allow you to count Salem 2 against  
12 your capacity responsibility?

13 MR. EVERETT: If I understand your question right,  
14 it can't be counted until it is dispatched. That means it  
15 has to be in commercial operation, it has to be turned over  
16 for day-to-day dispatching purposes to the system operator  
17 and the PJM operator.

18 COMMISSIONER BRADFORD: So it is not counted at all  
19 in the power pool's -- your projections through the summer?

20 MR. SMITH: It is in the forecast, but it is  
21 not available.

22 COMMISSIONER BRADFORD: It is not part of what  
23 they are considering and relying on until sometime out  
24 towards the end of the year.

25 MR. SMITH: We haven't changed the date yet.

29 mm 1 CHAIRMAN HENDRIE: What was the date, by the way?

2 MR. SMITH: The date was, for commercial operation  
3 on the system, in June?

4 MR. ECKERT: The end of June.

5 MR. SMITH: Commercial operation would be three to  
6 four months after then. It would be putting power -- we  
7 make an estimate of when it is going to go on line. We get  
8 into 10 percent for so long and 30 percent for another period.

9 It is about a five-month schedule to get from  
10 the operating license up to 100 percent power test, and  
11 during that period it is on there for varying loads.

12 CHAIRMAN HENDRIE: Let's see. Did you say the  
13 machine is, in your view, ready for an OL now?

14 MR. SMITH: Yes.

15 CHAIRMAN HENDRIE: And I guess the Staff now --

16 MR. ECKERT: There are a few minor things that  
17 are resting with Staff.

18 CHAIRMAN HENDRIE: -- and I&E will have to complete  
19 some --

20 MR. ECKERT: I believe that completed everything.

21 COMMISSIONER BRADFORD: Can you run through those  
22 five months for me?

23 You said it was 10 percent for one period of  
24 time, then 30 percent for another?

25 MR. SMITH: If you assume a July 1 operating license.

21  
22  
23  
24  
25

COMMISSIONER BRADFORD: Right.

MR. SMITH: Core loading complete by July 8.

Prepare for criticality July 12.

Initial criticality August 16.

Prepare for generator synchronization August 16.

Initial generator synchronization August 29.

10 percent power testing August 29.

30 percent power testing September 4.

50 percent power testing September 19.

Planned outages September 28.

Startup to 75 percent power October 9.

75 percent power October 14.

90 percent power October 31.

100 percent power November 8.

Commercial operation November 23.

COMMISSIONER BRADFORD: With outages during that  
period?

MR. SMITH: Just one outage.

COMMISSIONER BRADFORD: Just one outage.

CHAIRMAN HENDRIE: Other questions?

COMMISSIONER GILINSKY: If I could return to  
this point about the water level. I don't don't know what  
the meanest intellect is. If I recall correctly, Harold  
Denton said he wanted those in before he gave out any more  
operating licenses. If I am wrong about that, I hope somebody

mm31 1 will check into that and correct me.

2 MR. ECKERT: In order to install this it will  
3 require new materials that will have to be ordered once it  
4 is decided what to install, in time, on nuclear grade 1  
5 equipment, can be measured in a year or so, not in a week or  
6 so.

7 I see no way that such equipment could be ordered,  
8 installed -- first of all, design approved in a short period  
9 of time. The lead time for these things is very lengthy  
10 because of all the manufacturing requirements, qualifications.

11 COMMISSIONER GILINSKY: Did I recall correctly?

12 COMMISSIONER AHEARNE: I don't recall that.

13 MR. ECKERT: The contact that we have had with  
14 Harold Denton indicates what he wanted to do is try to firm  
15 up whether it would be done, and then set a schedule to do it,  
16 because of his recognition of the long lead time.

17 And with the water level as mentioned, the two-  
18 phase operation of water power, it makes it questionable  
19 if this is an advisable thing to do. The information I was  
20 giving you earlier was if it is decided that indeed this  
21 is the right thing to do, these are the radiation areas we  
22 would be working in to do it.

23 COMMISSIONER AHEARNE: When you said whether "this  
24 is the right thing," did you mean a particular design you  
25 are considering, or the concept at all?

mm32

1 MR. ECKERT: The concept at all.

2 MR. EVERETT: Whether or not this instrument would tell  
3 anything useful. That is an important question. I hope we  
4 don't ignore it.

5 COMMISSIONER AHEARNE: You are saying whether or  
6 not a measurement of water level in the reactor vessel will  
7 tell you anything useful at all?

8 MR. EVERETT: It is normally seldom it will tell  
9 you anything, even in an emergency.

10 I think that is a good question that should be  
11 answered very explicitly before we begin to tag things  
12 on to these systems.

13 COMMISSIONER AHEARNE: I guess when you say it  
14 should be answered, then you don't accept the current --  
15 like ACRS recommended --

16 COMMISSIONER GILINSKY: I must say I didn't hear  
17 anything like this raised when we were up before the  
18 Congress and had the ACRS here. It may be right. I don't  
19 know what the right answer is.

20 MR. ECKERT: We are waiting for the Staff to look  
21 very hard at this. And they are not sure it is a useful  
22 evaluation.

23 It has not been resolved.

24 CHAIRMAN HENDRIE: I talked to some of the Staff  
25 people who are engaged in it. There are some pretty good

mm33

1 arguments going on; people trying to understand the various  
2 transient situations in which it would give you a meaningful  
3 level, and if it would, why that would certainly be good, and  
4 try to sort out when it might mislead you if you didn't  
5 understand the nature of the beast and so on.

6 I think at Three Mile there were some times there  
7 when the pumps turned off and things were sort of sitting and  
8 just steaming quietly, when it sure would have been valuable  
9 if the water level gauge would have indicated that you wanted  
10 to do some things which I would have thought might have been  
11 done anyway.

12 But on the other hand, there are a number of  
13 situations where you have that flow, and maybe even as low  
14 as natural circulation flow where you want to look and see  
15 what you want to get as a reading on that.

16 COMMISSIONER AHEARNE: You are discussing not so  
17 much the question of whether it would be valuable to have  
18 an accurate measurement, but whether it is feasible to  
19 develop a device that gives you an accurate measurement.

20 CHAIRMAN HENDRIK: Feasible in the sense of putting  
21 a tap on the top and a tap down here, and you read that  
22 differential.

23 COMMISSIONER GILINSKY: Well, it doesn't tell you  
24 the water level. It tells you how much water is in there.

25 MR. EVERETT: That is pressure differential.

IMAGE EVALUATION  
TEST TARGET (MT-3)

mm34

1 CHAIRMAN HENDRIE: It is a pressure differential  
2 which may be due to dynamic forces and density differences.

3 (Simultaneous discussion.)

4 COMMISSIONER AHEARNE: I would guess this is an  
5 interesting, but different discussion.

6 MR. EVERETT: If you had a once-through boiler under  
7 the accident conditions, you can postulate. And if you have a  
8 dynamic once-through boiler you have got to figure out  
9 just what that measurement really means.

10 CHAIRMAN HENDRIE: Yes. I think there is a fair  
11 possibility that we will want to see something along this line  
12 because we will decide on balance it will be useful to have.

13 On the other hand, there is still some sorting out  
14 of the arguments one way or the other.

15 I don't want anybody to interpret my comments  
16 this morning as saying here I think it is a bad idea.

17 COMMISSIONER AHEARNE: How about this afternoon?

18 CHAIRMAN HENDRIE: This afternoon. It is a longer  
19 day than I thought.

20 -- Or, that I am advocating. I am just saying  
21 there are some aspects that need to be sorted out before we  
22 go off.

23 Now the general question of accurate fluid condi-  
24 tion throughout the system obviously there are better ways  
25 we can devise to know that, and the better off we will be.

mm35

1 Whether those are necessarily differential -- derived from  
2 differential pressure, you know, just high-low tapping and  
3 then inferring what the pressure differences mean, is meaning  
4 not so clear to me.

5 Well, other questions?

6 MR. EVERETT: Mr. Chairman, may I ask a question?

7 COMMISSIONER KENNEDY: Why not.

8 CHAIRMAN HENDRIE: We don't always expect an  
9 answer when we ask a question, and I am sure you don't always  
10 expect an answer when you ask a question.

11 MR. EVERETT: I was concerned to read that part  
12 of the reason for the holdup in issuing licenses -- if not  
13 the whole reason -- was lack of manpower resources because  
14 of the commitment of the Commission Staff to TMI analysis.

15 And I would think that the economics, if it is  
16 economics and safety, are certainly a judgment factor that  
17 you have to make on the site of safety.

18 But, if it is a manpower shortage that the  
19 Commission faces, there ought to be resources in this nation  
20 that the economics would dictate we can utilize to help out  
21 in that.

22 COMMISSIONER AHEARNE: But you do take into  
23 consideration the possibility that there might be some other  
24 things other than economics, that might be driving the  
25 Staff to be concerned with perhaps taking --

mm36

1 MR. EVERETT: Of course.

2 COMMISSIONER AHEARNE: I think you ought to at least  
3 recognize that that was an overriding factor.

4 COMMISSIONER KENNEDY: But let me say to the extent  
5 that the point you make is correct, it is that in fact there  
6 is a manpower shortage, and to the extent that that drives  
7 the question, let me say that I agree with you there ought to  
8 be resources in this nation which can be brought to bear to  
9 solve it.

10 COMMISSIONER GILINSKY: I don't think it applies  
11 though in this case, because the Staff has given higher  
12 priority to those systems that are closer to completion.

13 CHAIRMAN HENDRIE: There are a half dozen plants  
14 that are close, and Unit 2 at Salem is the lead unit in that  
15 trend, and I think the Staff resources, as Vic says, will be  
16 focused on those ready and near-ready units.

17 So, I think it is considerably less of a problem  
18 for the plant, for the unit that we are talking about here,  
19 than it is in general.

20 In general, in fact, we have a severe Staff  
21 resource problem and are taking steps to try to help that as  
22 fast as we can.

23 MR. EVERETT: The nation has tremendous technological  
24 resources as you all know at the national labs, Oak Ridge,  
25 Argonne, Savannah River and I'm sure you haven't overlooked

mm37

1 that.

2 CHAIRMAN HENDRIE: We have been in those discussions.

3 COMMISSIONER AHEARNE: We haven't overlooked that.

4 BUT I am sure you also recognize there was a very major  
5 accident, and for whatever reasons it did happen, and there  
6 is a lot of understanding that has to be developed.

7 MR. EVERETT: I don't mean to minimize --

8 COMMISSIONER AHEARNE: It is possible for some of  
9 the comments to be interpreted as that perhaps you were  
10 minimizing it.

11 COMMISSIONER AHEARNE: I certainly don't think  
12 you were minimizing it, not in the least.

13 CHAIRMAN HENDRIE: Other comments?

14 (No response)

15 Thank you very much, and we thank our colleagues  
16 from FERC and the Energy Resources Administration --  
17 Regulatory Administration, I'm sorry.

18 (Whereupon, at 4:10 p.m., the hearing in  
19 the above-entitled matter was adjourned.)

20

21

22

23

24

25
