DOCKET NO. 50-409

Director of Nuclear Reactor Regulation
ATTN: Mr. Dennis L. Ziemann, Chief
Operating Reactors Branch #2
Division of Operating Reactors
U. S. Nuclear Regulatory Commission
Washington, D. C. 20555

SUBJECT: DAIRYLAND POWER COOPERATIVE
LA CROSSE BOILING WATER REACTOR (LACBWR)
PROVISIONAL OPERATING LICENSE NO. DPR-45
APPLICATION FOR AMENDMENT TO LICENSE

Reference: (1) NRC Letter, Reid to Madgett, dated April 22, 1976.
(2) DPC Letter, LAC-4271, Madgett to Reid, dated October 13, 1976.
(3) NRC Letter, Reid to Madgett, dated January 10, 1978.
(4) DPC Letter, LAC-6280, Linder to Ziemann, dated May 11, 1979.
(5) License Amendment Fee, Check #21046, dated July 10, 1979.

Gentlemen:

An application to amend Provisional Operating License No. DPR-45 was requested in Reference 4. The requested amendment involved proposed changes to Technical Specifications for the La Crosse Boiling Water Reactor (LACBWR) which deal with the Inservice Inspection Program. Therefore, in accordance with our commitment of Reference 4, we are submitting the plans and requests for relief of the inservice testing and inspection programs for the La Crosse Boiling Water Reactor. LACBWR was issued a construction permit before January 1, 1971, therefore the enclosed inservice inspection and testing programs are submitted in accordance with 10CFR 50.55.a (g)(5), as meeting the requirements of 10CFR 50.55.a(g)(4) to the extent practical. The pressure vessels, piping and other components of LACBWR have been designated into classes utilizing the guidelines of NRC Regulatory Guide 1.26, Revision 3, dated February 1976 for inservice inspection purposes, though the components may or may not have been designed and constructed to the requirements of any part of the ASME Boiler and Pressure Vessel Code.

7908150683

693 333

The current issue of Technical Specifications contains the inservice inspection requirements for the LACBWR designated Class I piping and components. The inservice inspection interval was established by this Technical Specification as starting November 1, 1969 and ending October 30, 1979. Therefore, this submittal, in conjunction with Reference 4, establishes this as the second inservice inspection interval, and will start November 1, 1979, for all of the LACBWR inservice inspection and testing requirements.

All of the LACBWR Inservice Tests and Inspections will be conducted in accordance with the 1974 Edition of the ASME Boiler and Pressure Vessel Code and Summer of 1975 Addenda, Section XI.

Enclosure 1 includes a table, "Inservice Inspection Program - LACBWR Class I Components", wherein is listed all the Class I parts and components to be examined related to the ASME Code Section XI, and other pertinent information. Appendix A, "Weld Identification Drawings - LACBWR Class I Components", identifies in stylized isometric drawings, all the weld numbers and other relevant information for the Class I systems. Another table, "Relief for Class I Components Requiring ISI to ASME XI", identifies, by number, the specific Class I weld or component to which relief from the examination requirements of ASME Section XI is requested, and other relevant information.

Enclosure 2 contains the LACBWR Class II and III Inservice Inspection Program which includes a summary of the program, identification and classification of the system and/or components, scope of the inspection, listing of the drawings (P&ID's) associated with each system classification, and a table of symbols identification.

There is one request for relief of a Class III component, and no requests for relief of any Class II component.

Enclosure 3 contains the pump inservice testing program which includes a summary of the program, documentation sheets for each of the safety-related pumps, data sheet for use in pump performance analysis, and corrective action report form. There are no requests for relief of a pump test requirement.

Enclosure 4 contains the Valve Inservice Inspection Program which includes a summary of the program, tables listing each of the safety-related valves by number (as identified in P&ID's) and other relevant information. There are requests for relief of ASME Section XI testing requirements included in this enclosure. Also included are the data sheets for valve leak test documentation; leakage analysis data sheet, data sheet for valve stroke time documentation, corrective action report sheet, and list of abbreviations.

693 334

Mr. Dennis L. Ziemann, Chief
Operating Reactors Branch #2

LAC-6429
July 27, 1979

Enclosure 5 consists of 3 copies of each of the following P&ID's, submitted as requested by Reference 3 (Jan. 10, 1978):

System	Drawing (P&ID)
Purification	41-300-081
Main Feed	C/LR-53
Main Steam	M-12
Reactor Coolant and Level Instruments	C/LR-79
Decay Heat	41-300-083
Shutdown Condenser	41-300-084
High Pressure Core Spray	41-300-080
Boron Injection	41-300-080
Hydraulic Valve Accumulator	41-300-087
Demineralized Water	C/LR-74
Fuel Element Storage Well	41-300-079
Seal Injection	41-300-102 41-300-195
Low Pressure Service Water	M-17
Component Cooling Water	41-400-416
Alternate Core Spray)	M-21
High Pressure Service Water)	41-507-358
Shield Cooling	41-300-082
Feedwater Heaters	(C/LR-57 (b/LR-69
Condensate	M-13
Air Ejector Off-Gas	41-300-169

Enclosure of Reference 4 contained the language for inclusion of the Inservice Inspection Programs into the LACBWR Technical Specifications.

The fee for the review of this license amendment was forwarded by Reference 5.

The information submitted in this application for license amendment has been reviewed by LACBWR Committees as prescribed in Technical Specifications.

If there are any questions concerning this submittal, please contact us.

Very truly yours,

DAIRYLAND POWER COOPERATIVE

Frank Linder, General Manager

ENCLOSURE 2

INSERVICE INSPECTION PROGRAM

for

CLASS II AND III SYSTEMS

694 018

INTRODUCTION

The following Inservice Inspection Program for Class 2 and 3 components will be performed in accordance with Section XI of the ASME Boiler and Pressure Vessel Code of 1974 and Summer of 1975 Addenda, as required by 10 CFR 50, Section 50.55a(g).

The Inservice Inspection Program for Class 2 and 3 components begins November 1, 1979, consisting of four (4) 10-year inspection intervals divided into 40-month periods, in which a selected percentage of component inspections will be completed.

All steam, water, and radioactive waste containing, pressure retaining components and their supports, other than those already covered under the current Inservice Inspection Program for Class I components will be tested and examined in accordance with the 1974 Edition of ASME Boiler and Pressure Vessel Code and Summer of 1975 Addenda Section XI.

Each component in the following Inservice Inspection Program is assigned an ASME Code classification (as defined in Regulatory Guide 1.26) which will determine the examination requirements and time intervals that will apply.

694 019

REQUIREMENTS

Class III Components shall be tested by performing a system hydrostatic test at 1.1 x design system pressure, and conducting a 100% visual examination of the system and its associated supports prior to the end of each inspection interval (10 years). Also, a 100% visual examination while at operating pressure once every 40 months.

Open-ended portions of a non-closed system will be exempt from the requirements of the pressure test.

Components such as surge tanks, storage tanks, or expansion tanks and their associated piping up to the first shut-off valve will be tested by filling the tank to the tank's design capacity and performing a 100% visual inspection of the tank, piping and associated supports.

All testing, examining and inspecting of Class III components shall be in accordance with the 1974 Edition of ASME Boiler and Pressure Vessel Code and 1975 Summer Addenda, Section XI, Article IWD.

Class II components shall be tested in accordance with Table IWC-2520 and prior to the end of each inspection interval, a system hydrostatic test of 1.25 x design system pressure will be performed on both exempt and non-exempt components of Table IWC-2520 including a 100% visual examination of system and its supports.

Open-ended portions of a non-closed system will be exempt fro the requirements of the hydrostatic test.

Components such as surge tanks, storage tanks or expansion tanks and their associated piping, and supports will be tested by filling the tank to the tank's design capacity, and performing a 100% visual examination of tank, piping and their associated supports.

All testing, examining, and inspecting of Class II components shall be in accordance with the 1974 Edition of the ASME Boiler and Pressure Vessel Code and the 1975 Summer Addenda, Section XI, Article IWC.

The following systems or portions of the systems as applicable are incorporated into the Inservice Inspection Program in accordance with 10 CFR 50 Section 50.55a and Regulatory Guide 1.26 and shown on enclosed referenced drawings (P & ID's).

694 020

CLASS II

Reference	System
1.	Purification
2.	Main Feed
3.	Main Steam
4.	Reactor Coolant Level and Pressure Instruments
5.	Decay Heat
6.	Shutdown Condenser
7.	High Pressure Core Spray

CLASS III

Reference	System
8.	Boron Inject
9.	Hydraulic Valve Accumulator
10.	Demineralized Water
11.	Fuel Element Storage Well
12.	Seal Injection
13.	Low Pressure Service Water
14.	Component Cooling Water
15.	High Pressure Service Water and Alternate Core Spray
16.	Shield Cooling
17.	Feed and Condensate Feed Heaters, Flash Tank, and Gland Seal Steam Generator
18.	Main Condensate System
19.	Air Ejector Off-Gas

Class IV(D) systems are exempt from Inservice Inspection Requirements. These include the Liquid Waste Management System, the Condensate Demineralizer System outside of the main flow path, and the Containment Spray System.

Although Class IV Systems do not require an Inservice Inspection, they shall follow the Quality Standards set forth in Regulatory Guide 1.26 Table 1 for Quality (D) components.

System pressure tests, other than those tests which are coordinated with Class I hydrostatic tests, shall be performed on those portions of the systems which are highlighted in red on the system P&ID's provided. System pressure tests shall be performed in accordance with LACBWR 10-Year Plan.

694 021

RELIEF REQUEST BASIS

COMPONENT:	Sodium Pentaborate Tank 60-19-001
FUNCTION:	Stores, at atmospheric pressure, concentrated sodium pentaborate, for injection into rea tor primary coolant, in the case of control rod(s) failure to insert.
CLASS:	III
TEST REQUIREMENT:	IWD-2410(b), system pressure test on the open tank.
BASIS FOR RELIEF:	In order to fill the tank to capacity, it would be necessary to mix a quantity of dry boric acid, dry borax in 120°F. water equal to approximately 25% of the tank's capacity. Then, at the completion of the inspection, drain the tank to normal level and dispose of the sodium pentaborate solution.
ALTERNATE TESTING:	System inservice test will be substituted at the scheduled intervals.

PURIFICATION SYSTEM (Dwg. 41-300-081) (1)

The Purification System was previously classified Class I, but without affecting the Inservice Inspection Program for Class I, the system is reclassified Class II.

With pipe size ≤ 2", the Purification System is exempt from the requirements of Article IWC-2520, but a system hydrostatic test is required prior to the end of each inspection interval. The Purification System hydrostatic test can be coordinated with the Class I systems hydrostatic test.

MAIN FEED (Dwg. C/LR-53) (2)

The Class II portion of the Main Feed System shall be inspected and tested in accordance with Articles IWC-2520 and IWC-2600 as shown on the enclosed LACBWR 10-Year Examination Plan.

Requirements for a hydrostatic test of the Main Feed System can be coordinated with the hydrostatic test required for Class I portion of the system prior to the end of each inspection interval.

MAIN STEAM SYSTEM (Dwg. M-12) (3)

Inspection of the Class II Main Steam System shall be in accordance with IWC-2520 and IWC-2600 as shown on the enclosed LACBWR 10-Year Examination Plan. Prior to the end of each inspection interval, a hydrostatic test shall be performed on the system, and can be coordinated with the hydrostatic test required for the Class I portion of the system.

REACTOR COOLANT LEVEL AND PRESSURE INSTRUMENTS (Dwg. C/LR-79) (4)

All level and pressure instruments in the Reactor Coolant System require a hydrostatic test prior to the end of each inspection interval. This hydrostatic test can be coordinated with the hydrostatic test of the Primary System for Class I systems.

DECAY HEAT REMOVAL SYSTEM (Dwg. 41-300-083) (5)

The entire Decay Heat Removal System is tested under the ISI Program for Class I components with the exception of the instrument lines, which require a hydrostatic test. This can be coordinated with the hydrostatic test required for Class I systems.

694 023

SHUTDOWN CONDENSER SYSTEMS (Dwg. 41-300-084) (6)

The Shutdown Condenser System (Primary side) requires a system hydrostatic test which can be coordinated with the hydrostatic test of the Class I systems.

HIGH PRESSURE CORE SPRAY SYSTEM (Dwg. 41-300-080) (7)

Portions of the Core Spray System associated with the Overhead Storage Tank (OHST) can be tested by filling the OHST to its design capacity and inspecting the system to the first isolation valve. The remainder of the system shall be hydrostatically tested prior to the end of the inspection interval. The hydrostatic test of the system can include portions of the Boron Injection System.

BORON INJECTION SYSTEM (Dwg. 41-300-080) (8)

The Sodium Pentaborate Tank and associated piping up to the first shutoff valve can be tested by filling the tank to its design capacity and performing a 100% visual examination.

The remainder of the system requires visual examination during operation and a pressure test which can be coordinated with the High Pressure Core Spray Suction Line hydrostatic test in accordance with LACBWR 10-Year Examination Plan.

HYDRAULIC VALVE ACCUMULATOR SYSTEM (Dwg. 41-300-087) (9)

Water return tank and all piping associated with the tank shall be tested by filling the tank to its design capacity and performing a 100% visual examination.

Visual examination of the remainder of the system is required during operation and pressure testing in accordance with LACBWR 10-Year Examination Plan.

DEMINERALIZED WATER SYSTEM (Dwg. C/LR-74) (10)

The Virgin Water Tank will be tested by filling the tank to its design capacity and performing a visual examination of the tank and associated piping up to first shutoff valves.

A visual examination of the system is required for the remainder of the system during operation, and pressure testing, in accordance with LACBWR 10-Year Examination Plan.

694 024

FUEL ELEMENT STORAGE WELL SYSTEM (Dwg. 41-300-079) (11)

Fuel Element Storage Well and its associated piping up to the first shut-off valves will be tested by filling the Fuel Element Storage Well to its design capacity and performing a 100% visual examination of those portions of the system.

The remaining portions of the system will be visually examined during operation and pressure testing in accordance with LACBWR 10-Year Examination Plan.

SEAL INJECTION SYSTEM (Dwgs. 41-300-102 & 41-400-195) (12)

Seal Injection Reservoir and pump suction lines will be tested by visual examination while the system is filled to design capacity.

A visual examination of the remaining portion of the system shall be performed during operation and pressure testing in accordance with LACBWR 10-Year Examination Plan. The pressure test can be coordinated with Class I System hydrostatic test.

LOW PRESSURE SERVICE WATER SYSTEM (Dwg. M-17) (13)

Those portions of the system essential for plant safety, Control Room operations, primary heat removal, and post accident heat removal, shall be tested by visual examination during operation and pressure testing in accordance with LACBWR 10-Year Examination Plan.

COMPONENT COOLING WATER SYSTEM (Dwg. 41-400-416) (14)

Piping associated with Surge Tank and the Surge Tank shall be tested by filling the tank to its design capacity and performing a 100% visual examination.

The remainder of the system shall be tested by visual examination during operation and pressure testing in accordance with LACBWR 10-Year Examination Plan.

HIGH PRESSURE SERVICE WATER AND ALTERNATE CORE SPRAY SYSTEMS (Dwgs. M-21 & 41-507-358) (15)

In the Alternate Core Spray System the series check valves are the Primary System Pressure Boundary. The two (2) systems will be tested together up to the 6" flange inside the Biological Shield, by performing a visual inspection during operation and pressure testing in accordance with LACBWR 10-Year Examination Plan.

694 025

SHIELD COOLING SYSTEM (Dwg. 41-300-082) (16)

Return lines and Surge Tank shall be tested by filling the tank to design capacity and performing a 100% visual inspection.

The remainder of the system shall be tested by performing a visual inspection during operation and pressure testing in accordance with LACBWR 10-Year Examination Plan.

FEED AND CONDENSATE HEATERS, FLASH TANK AND GLAND SEAL STEAM GENERATOR (Dwg. b/LR-69 & C/LR-57) (17)

Perform visual examination during operation and pressure testing of all portions of the system which does not operate at condenser pressure in accordance with LACBWR 10-Year Examination Plan.

MAIN CONDENSATE SYSTEM (Dwg. M-13) (18)

Perform system test by visual examination during system operation and pressure testing in accordance with LACBWR 10-Year Examination Plan. The test shall include the reactor feed pump suction.

AIR EJECTOR OFF-GAS SYSTEM (Dwg. 41-300-169) (19)

Test the system by performing a visual examination during operation and pressure testing in accordance with LACBWR 10-Year Examination Plan.

For the system pressure test, the portion of the system on the suction side of the Waste Gas Compressor shall be tested pneumatically and the discharge side of the compressor will be tested with water. The two tests will be at different pressures.

PUMP TESTING PROGRAM

694 043

INSERVICE INSPECTION FOR PUMPS

Quantities to be measured are listed below.

QUANTITY	MEASURE	OBSERVE
Speed, N	X	
Inlet Pressure, Pi	X[2]	
Differential Pressure, ΔP	X[1]	
Flow Rate, Q	X[1]	
Vibration Amplitude, V	X	
Proper Lubricant Level or Pressure		X
Bearing Temperature, Tb	X	

[1]In a fixed resistance system, it is required to measure ΔP or Q, not both. In a variable resistance system, both shall be measured.
[2]Measure before pump startup and during the test.

Each pump shall have an inservice test performed monthly during operation where applicable. During shutdown conditions the testing should be performed, but is not mandatory.

The allowable ranges of quantities measured are stated in Table IWP-3100-2.

Initial testing of the pumps will establish the reference quantities required to conduct future tests on the pumps.

Pump Test shall be performed by establishing system conditions the same as the previous test; this is done to determine the pump's operability with reference to the quantities established in the initial test.

The duration of the test when bearing temperature is not required is 5 min. under stable conditions; then take data.

When bearing temperatures are required, the data shall be taken when three successive bearing temperature readings taken at 10 min. intervals do not vary by more than 3%.

Pumps to be tested are:

1) High Pressure Core Spray Pump 1A 53-06-001
2) High Pressure Core Spray Pump 1B 53-06-002
3) Alternate Core Spray Pump 1A 38-06-001
4) High Pressure Service Water Pump 1B 75-06-002
5) Demin. Water Transfer Pump 1A 67-06-001
6) Demin. Water Transfer Pump 1B 67-06-002
7) Component Cooling Water Pump 1A 57-06-001
8) Component Cooling Water Pump 1B 57-06-002

All quantities that are measured for a test shall be reviewed and analyzed within 96 hours of the test. If any of the quantities are outside of the acceptable range, that quantity will be in either the Alert Range or Required Action Range. To determine which range the quantity is in, and what action is to be taken, refer to ASME Boiler and Pressure Vessel Code, Section XI, Article I.W.P. Table IWP-3100-2 and Paragraph IWP-3230, 1974 Edition with Summer 1975 Addenda.

VALVE TESTING PROGRAM

694 056

INSERVICE INSPECTION FOR VALVES

Valves Inservice Inspection Program for safety-related Class 1, 2 and 3 valves is established in accordance with ASME Boiler and Pressure Vessel Code, 1974 Edition, and 1975 Summer Addenda, Section XI, Subsection IWV.

The Inservice Inspection Program for Valves is intended to verify operational readiness of safety-related valves in Class 1, 2 and 3 systems on a continuing basis.

Valves used for operating convenience such as manual vent, drains, sample, instrument test, and valves used for maintenance only are excluded from the requirements of Article IWV of the ASME Code.

To determine the test requirements for applicable valves, there are five (5) categories, and each valve will fall into one (1) or more categories. If a valve has more than one (1) category, that valve will meet the requirements for each category.

The five (5) categories will be defined as:

Category A - valves in which a limited seat leakage is specified in the closed position to fulfill their function.

Category B - valves in which seat leakage is inconsequential for the fulfillment of their function.

Category C - valves which are self-actuating by some system characteristic.

Category D - valves actuated by an energy source capable of only one (1) operation.

Category E - valves which are normally locked, or sealed, closed or open.

Tests which require a measured characteristic of a valve (such as stroke time or seat leakage,) will have a data sheet to document the test results.

For power-operated valves which require stroke time, the full stroke time is the time required for a valve to travel in the direction required to fulfill its function, from full shut to full open, or full open to full shut (etc.)

In the case of power-operated valves which do not have an assigned stroke time, the first test performed on these valves will be used to determine the stroke time for future tests. The operational readiness during the first test for the above-mentioned valves will be determined by operating experience.

694 057

To maintain the current status of valve testing and exercising, each valve is listed under the applicable category heading, and the date of the last test or cycle shall be entered.

The test frequency is determined from the appropriate IWV Article of the ASME Code. The test frequency is dependent upon category, type of test to be performed, and type of valve to be tested.

This testing program for valves will be performed using a 20-month inspection interval for the service life of the valves. The first inspection interval will begin November 1, 1979.

If a leak rate for category "A" valves 6 in. and larger exceeds the previous test by an amount that reduces the margin between the measured rate and the maximum permissible rate by 50% or more, then the test frequency shall be doubled until the valve is repaired. When a test shows that the leak rate is increasing with time, and a projected leak rate using three or more test shows that the next test will exceed the maximum permissible leakage rate by 10%, the valve will be repaired or replaced before being returned to service.

RELIEF REQUEST BASIS

VALVE:	53-25-001
CATEGORY:	B
CLASS:	2
FUNCTION:	LOW PRESSURE CORE SPRAY SUPPLY ISOLATION
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	This valve is required to operate at low plant pressure (30#); to cycle this valve during plant operations could cause an overpressure condition in the system which supplies the valve and depressurization of primary through one check valve.
ALTERNATE TESTING:	This valve will be exercised at each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	53-25-004
CATEGORY:	B
CLASS:	3
FUNCTION:	ISOLATE HIGH PRESSURE SERVICE WATER FROM THE CORE SPRAY SYSTEM
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Isolating this valve during plant operation is not permitted by LACBWR Technical Specifications.
ALTERNATE TESTING:	This valve will be exercised at each cold shutdown.

POOR ORIGINAL

RELIEF REQUEST BASIS

VALVE:	53-26-001
CATEGORY:	C
CLASS:	2
FUNCTION:	PREVENT BACKFLOW FROM REACTOR PLANT TO OVERHEAD STORAGE TANK
TEST REQUIREMENT:	Ex cise valve for operability every three months.
BASIS FOR RELIEF:	To establish flow through this valve, the reactor plant must be depressurized; therefore, this valve cannot be exercised during plant operation.
ALTERNATE TESTING:	This valve will be exercised at each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	53-26-002
CATEGORY:	C
CLASS:	1
FUNCTION:	PUMP 53-06-002 DISCHARGE CHECK VALVE
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Any exercising of this valve would require injecting cold high pressure core spray water into the reactor vessel, which would cause adverse effects unless the plant is shutdown and cooldown.
ALTERNATE TESTING:	This valve will be exercised each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	53-26-003
CATEGORY:	C
CLASS:	1
FUNCTION:	PUMP 53-06-001 DISCHARGE CHECK VALVE
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Any exercising of this valve would require injecting cold high pressure core spray water into the reactor vessel, which would cause adverse effects unless the plant is shutdown and cooldown.
ALTERNATE TESTING:	This valve will be exercised each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	69-26-001
CATEGORY:	C
CLASS:	2
FUNCTION:	PREVENT BACKFLOW FROM HIGH PRESSURE SERVICE WATER OR REACTOR PLANT INTO OVERHEAD STORAGE TANK (OHST)
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Exercising this valve would require establishing flow through the Core Spray System, which is not allowed during normal plant operation.
ALTERNATE TESTING:	This valve will be exercised each cold shutdown.

RELIEF REQUEST BASIS

VALVES:	32-98-001 thru 32-98-029 (LOWER CONTROL ROD DRIVE MECHANISMS)
CATEGORY:	B
CLASS:	2
FUNCTION:	TO ACTUATE LOWER CONTROL ROD DRIVE MECHANISMS HYDRAULIC MOTORS WHEN SCRAM SIGNAL IS INITIATED
TEST REQUIREMENT:	Exercise valves for operability every three months.
BASIS FOR RELIEF:	Exercising these valves requires inserting the control rods, requiring plant shutdown.
ALTERNATE TEST:	The valves will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	38-26-001
CATEGORY:	C
CLASS:	2
FUNCTION:	PREVENT BACKFLOW FROM REACTOR VESSEL TO ALTERNATE CORE SPRAY SYSTEM
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Any exercising of this valve would require isolating the primary system from the alternate core spray system, which would decrease the plant's accident protection, thus placing the plant in an unsafe condition.
ALTERNATE TEST:	The valve will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	38-26-002
CATEGORY:	C
CLASS:	2
FUNCTION:	BACKUP PREVENTION FOR BACKFLOW OF REACTOR COOLANT TO ALTERNATE CORE SPRAY SYSTEM
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Any exercising of this valve would require isolating the primary system from the alternate core spray system, which would decrease the plant's accident protection, thus placing the plant in an unsafe condition.
ALTERNATE TEST:	The valve will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	38-30-001
CATEGORY:	B
CLASS:	3
FUNCTION:	TO OPEN UPON INITIATION OF THE ALTERNATE CORE SPRAY SYSTEM
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Exercising this valve requires isolating the alternate core spray system from the primary plant, which would place the plant in an unsafe condition in the event of an accident.
ALTERNATE TEST:	The valve will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	38-30-002
CATEGORY:	B
CLASS:	3
FUNCTION:	TO OPEN UPON INITIATION OF THE ALTERNATE CORE SPRAY SYSTEM
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Exercising this valve requires isolating the alternate core spray system from the primary plant, which would place the plant in an unsafe condition in the event of an accident.
ALTERNATE TEST:	The valve will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	64-30-001
CATEGORY:	A
CLASS:	1
FUNCTION:	TO ISOLATE MAIN STEAM LINE INSIDE THE CONTAINMENT BUILDING
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Movement of this valve from full open will initiate a full scram.
ALTERNATE TEST:	Valve will be exercised each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	73-25-021
CATEGORY:	A
CLASS:	D
FUNCTION:	TO ISOLATE CONDENSATE RETURNING TO HEATING STEAM SYSTEM UPON A HIGH CONTAINMENT BUILDING PRESSURE
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	To exercise this valve during plant operations would require inserting a high Containment Building pressure signal which could cause other safety system actuations and place the plant in an unsafe condition.
ALTERNATE TEST:	The valve will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	55-25-003
CATEGORY:	A
CLASS:	D
FUNCTION:	TO ISOLATE CONTAINMENT VESSEL FROM OFF GAS SYSTEM
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	To exercise this valve during plant operations would require inserting a high Containment Building pressure signal which could cause other safety system actuations and place the plant in an unsafe condition.
ALTERNATE TEST:	Valve will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	65-26-001
CATEGORY:	A, C
CLASS:	1
FUNCTION:	TO PREVENT BACKFLOW FROM PRIMARY SYSTEM INTO REACTOR FEED SYSTEM
TEST REQUIREMENTS:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Exercising this valve during plant operations would require stopping feedwater flow to the reactor, thus placing the plant in an unstable condition.
ALTERNATE TESTING:	This valve will be exercised each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	62-25-001
CATEGORY:	B
CLASS:	1
FUNCTION:	TO ISOLATE THE SHUTDOWN CONDENSER FROM THE MAIN STEAM SYSTEM AND TO OPEN DURING PLANT MANUAL DEPRESSURIZATION
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	This system is not designed to operate during plant operations; therefore, exercising this valve would place the plant in an unstable condition.
ALTERNATE TEST:	The valve will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	62-25-011
CATEGORY:	B
CLASS:	1
FUNCTION:	TO ISOLATE THE SHUTDOWN CONDENSER FROM THE MAIN STEAM SYSTEM AND TO OPEN DURING PLANT MANUAL DEPRESSURIZATION
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	This system is not designed to operate during plant operations; therefore, exercising this valve would place the plant in an unstable condition.
ALTERNATE TEST:	The valve will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	62-25-013
CATEGORY:	B
CLASS:	2
FUNCTION:	TO OPEN DURING PLANT MANUAL DEPRESSURIZATION
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Exercising this valve during plant operations could cause plant depressurization, thus placing the plant in an unsafe condition.
ALTERNATE TEST:	The valve will be exercised for operability each cold shutdown.

RELIEF REQUEST BASIS

VALVE:	62-25-014
CATEGORY:	B
CLASS:	2
FUNCTION:	TO OPEN DURING PLANT MANUAL DEPRESSURIZATION
TEST REQUIREMENT:	Exercise valve for operability every three months.
BASIS FOR RELIEF:	Exercising this valve during plant operations could cause plant depressurization, thus placing the plant in an unsafe condition.
ALTERNATE TEST:	The valve will be exercised for operability each cold shutdown.

CATEGORY A VALVE LEAK RATE TEST

DATA SHEET

VALVE ID_____ SIZE_____ DATE_____

TYPE "C" TEST DATA SHEET: _____

PART I LEAK MEASUREMENT

Permissible Leak Rate _____SCFH

Measured Leak Rate _____SCFH

If Valve <6", go to Summary. If valve ≥6", complete Parts 2 and 3.

PART II MARGIN CALCULATION

$$R = \frac{MR - LR}{MR - PR} = \frac{\_\_\_\_ - \_\_\_\_}{\_\_\_\_ - \_\_\_\_} = \_\_\_\_$$

$R > 0.5$ PASS_____

$R \leq 0.5$ FAIL_____

MR Maximum Permissible Leak Rate
LR Measured Leak Rate (this test)
PR Measured Leak Rate (previous test)

PART III PROJECTION CALCULATION

Estimate Projected Rate for Next Test if:
(1) At least 3 successive tests have passed, and
(2) Leakage rates increase with time

Projected Leak Rate for Next Test _____ N/A
_____ SCFH

Projection below 1.1 x MR PASS_____
Projection above 1.1 x MR FAIL_____

SUMMARY OF RESULTS

		PASS	FAIL	N/A
≥6"	Part I			
	Part II			
	Part III

DECAY HEAT BLOWDOWN AND STEAM TRAPS DRAIN TO HOTWELL CONTAINMENT ISOLATION VALVES (M-17) 56-25-001 AND 62-25-017

TEST DATA:

Time At Start Of Leakage Measurement _____

Time At Completion of Leakage Measurement _____

Water Collected _____ Liters

COMPUTATIONS AND EVALUATION:

Total Length Of Test _____ Hours

Leak Rate _____ Liters/Hour

Leak Rate Standardized _____ SCFH

Leak Rate (SCFH) = Leak Rate(Liters/Hour) x .1603

ACCEPTANCE CRITERIA: .375 SCFH (Reference: Tech. Spec. 5.2.1.3(b))

If total leakage for both valves exceeds .375 SCFH, the individual leak rates must be determined or the valves repaired or adjusted as necessary to reduce total leakage to ≤ .375 SCFH. Technical Specifications permit .375 SCFH through each valve but this test does not provide for individual measurement.

DATA SHEET 3.5.11

TYPE "C" LEAK TEST

Reactor Vent Header Valve Seat (55-~~23~~25-003) (M-29)

Prepared or Revised By	Date	Oper Rev. Com. Approval	Date	Safety Rev Com Approval	Date
J. D. Parkyn	5/21/76		5/21/76		5/21/76

TEST DATA:

	Initial Reading	After 30 Minutes	After 60 Min
Time			
Temperature	°F	°F	
Pressure Gauge No. 1	PSIG	PSIG	
Pressure Gauge No. 2	PSIG	PSIG	

COMPUTATIONS AND EVALUATION:

	Pressure Change Over 60 Minutes	Leak Rate (SCFH)
Pressuge Gauge No. 1		
Pressure Gauge No. 2		

$$\text{Leak Rate(SCFH)} = \left(\frac{\text{Pressure Change Per Hour}}{14.7}\right)(2.9061\ ft^3)$$

ACCEPTANCE CRITERIA: .375 SCFH (Reference: Tech. Spec. 5.2.1.2(b)4)

TEST_____ PASS_____

**RETEST_____ *FAIL_____

Test connection caps have been replaced. _____

*If test is observed to be failing after several data points, extend points to ensure six (6) sets of data are taken. (Reference: Technical Specification 5.2.1.5)

**List repairs performed before retest including MR No._____.

DATA SHEET 3.5.14 - Primary System Containment Isolation Valves - (Cont'd)

ALTERNATE CORE SPRAY CHECK VALVES (1-A)

Prepared or Revised By	Date	Oper. Rev. Com. Approval	Date	Safety Rev. Com. Approval	Date
J. D. Parker	5/21/76		5/21/76		8/21/76

TEST DATA:

Time At Start Of Leakage Measurement _____

Time At Completion of Leakage Measurement _____

Water Collected _____ Liters

COMPUTATIONS AND EVALUATION:

Total Length Of Test _____ Hours

Leak Rate _____ Liters/Hour

Leak Rate Standardized _____ SCFH

Leak Rate (SCFH) = Leak Rate(Liters/Hour) x .1603

ACCEPTANCE CRITERIA: .375 SCFH (Reference: Tech. Spec. 5.2.1.3(b))

TEST_____ PASS_____

**RETEST_____ *FAIL_____

REFERENCE: Type "C" Leak Test - Technical Specification 5.2.1.3.

*If test is observed to be failing after several data points, extend to ensure six (6) sets of data are taken. (Reference: Technical Specification 5.2.1.5)

**List repairs performed before retest including MR No._____.
