The valve was manually shut and a caution tag was placed on its control switch. The torus was pumped to the normal operating range. Upon investigation of the valve, it was found that pressure switch E41-PSH-N027 was operating erratically, due to moisture and corrosion, causing the FO12valve to not fully close. LER CONTINUATION - RO# 2-79-060

Facility: BSEP Unit No. 2 Event Date: 7-21-79

The pressure switch was replaced, calibrated, and its conduit entrance was resealed to prevent moisture damage. The valve was then tested satisfactorily. The switch on the Unit 1 HPCI unit was inspected and found to be satisfactory. This is considered an isolated event and no further action is required.
