Docket No. 50-245

Director of Nuclear Reactor Regulation
Attn: Mr. D. L. Ziemann, Chief
Operating Reactors Branch #2
U. S. Nuclear Regulatory Commission
Washington, D. C. 20555

References: (1) W. G. Council letter to D. L. Ziemann dated February 28, 1979.

Gentlemen:

Millstone Nuclear Power Station, Unit No. 1
In-Service Inspection and Testing Program

Reference (1) forwarded the revised in-service testing program for safety-related pumps and valves, and an inspection program for pressure testing essential systems, for the second 20-month segment of the third inspection period for Millstone Unit No. 1. The segment began on May 28, 1979.

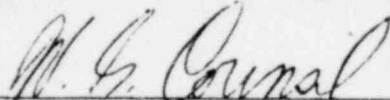

On August 16 and 17, 1979, during telephone conversations between members of our staffs, a need was identified to provide additional information on several valves in the program.

This submittal contains the additional information in the form of a revised valve listing, and requests relief for test requirements found to be impractical. We have also included a complete set of system boundary diagrams for use by your staff reviewers.

NNECO intends to implement the program described within by January 1, 1980.

Very truly yours,

NORTHEAST NUCLEAR ENERGY COMPANY

W. G. Council
Vice President
