POOR ORIGINAL

ABSTRACT

The Ten-year program presented within this document was written to comply with the requirements of revisions to 10 CFR 50.55 a(g) published in the Federal Register, September 1, 1978, concerning inservice examinations, tests, evaluations, and repairs of safety related components. This Inservice Inspection Program complies with the surveillance requirements of Technical Specifications section 4.6.E.

Table of Contents (cont.)

1277 210

CODE BASIS AND ACCEPTANCE CRITERIA

A) The nondestructive inspections listed under Sections I and II shall be performed per the requirements of the 1974 edition of ASME, Section XI, up to and including the 1975 Summer Addenda except piping examinations (Categories B-F, B-J, C-F, & C-G) shall be per the requirements of ASME Section XI, 1974 edition, 1976 Summer Addenda, Appendix III.

B) Recording levels shall be at 50% of the reference level.

C) The acceptance criteri.. for the nondestructive examinations shall be per the same Code required for the performance of the examinations as named in part A above.

1277 211

TECHNICAL SPECIFICATIONS

In compliance with 10 CFR 50.55 a(g)(5) Vermont Yankee submitted a revision to its Technical Specifications on January 30, 1979. Presently, Vermont Yankee bases the Inservice Inspection Program on its current technical specifications and the edition of ASME Section XI, described under "Code Basis and Acceptance Criteria".

Commencing January 30, 1980, the updated Technical Specifications are to be implemented. The effective edition of the code is the edition and addenda published in 10 CFR 50.55 a(b). The code applicable to the updated Technical Specifications will be ASME Section XI, 1974, Summer 1975 addenda.

In accordance with 10 CFR 50.55 a(g) and Vermont Yankee letter to NRC dated April 29, 1977, the three - three and one-third year inspection periods of the first interval for Inservice Inspection commence as follows:

Period 1	November 30, 1972
Period 2	November 30, 1977
Period 3	January 30, 1980

The Inservice Test Program (Pump and Valve Operability) commences July 30, 1979. (Refer to Relief Request G-2).

1277 212

CLASSIFICATION OF NUCLEAR SYSTEMS AND COMPONENTS

The guidelines for Safety Classification at Vermont Yankee are defined in Yankee Atomic Electric Company document; Operational Quality Assurance Manual (YOQAP-1-A), Appendix E, issued August 15, 1977.

This classification is summarized in the accompanying tables. Flow diagrams of Safety Related Systems are provided following the Safety Class tables.

1277 213

TABLE 1

SAFETY CLASS 1 COMPONENTS

* Reactor Pressure Vessel

* Reactor Vessel Support Skirt

* Recirculation System Piping

* Recirculation System Pumps and Valves

* Main Steam Piping (to and including outermost containment isolation valve)

* Main Steam Safety Relief Valves

* Feedwater Piping (to and including outermost containment isolation valve)

* Standby Liquid Control Piping Inside Containment (to and including outermost isolation valve)

* RHR Piping and Valves Inside Containment (to and including outermost isolation valve)

* Core Spray Piping and Valves Inside Containment (to and including outermost isolation valve)

* Control Rod Drive Return Piping (to and including outermost isolation valve)

* HPCI Steam Piping and Valves Inside Containment (to and including outermost isolation valve)

* RCIC Steam Piping and Valves Inside Containment (to and including outermost isolation valve)

* Reactor Water Cleanup Piping and Valves Inside Containment (to and including outermost isolation valve)

* Reactor Vessel Internals

* Reactor Vessel Stabilizers

Note: Vessel Internals and Stabilizers are addressed as S.C. - 2 in YOQAP-1-A. However, for ISI purposes VY classifies them as S.C. - 1 in accordance with ASME Section XI.

1277 214

TABLE 2

SAFETY CLASS 2 COMPONENTS

** CRD Scram Discharge Volume

** Scram Piping

** Standby Liquid Control Pumps and Explosives Valves

** Standby Liquid Control Piping (outside containment)

** Primary Containment Piping and Valves (to and including outermost isolation valve)

** Reactor Building Ventilation Isolation Valves

** Standby Gas Treatment Filters and Fans

** Containment Air Dilution Pressurization System Compressors, Piping and Valves

** CAD Vent System Piping and Valves

** CAD Sampling System Piping and Valves

** RHR Piping, Pumps and Valves (outside containment)

** RHR Heat Exchangers (shell side)

** Core Spray Piping, Pumps and Valves (outside containment)

** HPCI Steam Supply and Exhaust Piping and Valves (outside containment)

** HPCI Pump-Turbine

** HPCI Injection Piping and Valves

** RCIC Steam Supply and Exhaust Piping and Valves (outside containment)

** RCIC Pump-Turbine

** RCIC Injection Piping and Valves

1277 215

TAPLE 3

SAFETY CLASS 3 COMPONENTS

*** Main Steam Safety Relief Valve Discharge Piping

*** Service Water Pumps

*** Service Water Piping and Valves to Supply Water to RHR Service Water Pumps and Diesel Coolers

*** RHR Service Water Pumps

*** RHR Heat Exchanger (tube side)

*** Fuel Pool Cooling Pumps, Valves, Heat Exchangers and Piping

*** Advanced Off-Gas Charcoal Absorber Tanks and Associated Piping and Valves

*** Diesel Generator Air Start System

*** Fuel Oil System

*** Diesel Coolers and Associated Piping and Valves (service water side)

VY-E-75-002	Containment Air Dilution System

1277 217

NUMBER: G-1

CODE PARAGRAPH: IWA-2232

BASIS: As described in the NRC Safety Evaluation associated with Ammendment No. 45, dated June 20, 1978, our present need is primarily for the identification of service induced flaws. Procedures written to the summer 1976 Code meet this objective.

ALTERNATE: ASME Section XI, 1974 edition, 1976 summer addenda, Appendix III, will be used for all piping examinations. Recording levels will be at 50% of the reference level.

1277 218

RELIEF REQUEST BASIS

Number G-2

Number: G-2 - Effective July 30, 1979 to January 29, 1980

Code Paragraphs:

IWP-3100	IWV-3200
IWP-3200	IWV-3300
IWP-3300	IWV-3400
IWP-3400	IWV-3500
IWP-3500	IWV-3600
IWP-6000	IWV-6000

Basis: For the reasons discussed in a Vermont Yankee letter (D. E. Vandenburgh) to the NRC (Office of Nuclear Reactor Regulation) dated April 25, 1979, and two telephone conversations between the VY staff and the NRC staff on June 11 and 14, Vermont Yankee requests temporary relief from the ASME Section XI Paragraphs specified above.

ASME Section XI specifies many procedural, programmatic, and record-keeping requirements necessary for full compliance with the Pump and Valve Testing Program. In order to prepare our procedural framework for fulfilling all of the programmatic requirements of ASME XI, it requires a change to more than 50 station operating procedures and training of appropriate plant personnel. Our present procedures do provide sufficient administrative controls, extensive testing instructions and adequate requirements for data recording and recordkeeping as evidenced by a 7-year history of a successful surveillance and maintenance program.

The Pump and Valve Testing portion of the Inservice Inspection Program incorporates, as a minimum, all presently required Technical Specification referenced operability tests. In addition, all other valves and pumps specified are, and will continue to be, tested (with minor exceptions) in accordance with the ISI Program. Of the approximately 1200 valves specified in the Program, 27 small relief valves and 2 level control valves will not be tested in full compliance with the Program until January 30, 1980.

Alternate: Due to the extensive procedural modifications and training required to implement a quality ASME Section XI Program and due to the fact that our present program is essentially the same as the one proposed in our April 30, 1979 submittal, we will continue to perform the operability testing of pumps and valves as detailed in our present procedures until January 29, 1980. Commencing January 30, 1980, all tests performed will be in full compliance with our Inservice Inspection Program. This Relief Request will be voided at that time.

1277 219

SAFETY CLASS 1 COMPONENTS

In compliance with Section XI, Sub-section IWB, safety class 1 components are to be inspected as addressed in IWB-2600. Those components meeting the exemption criteria of IWB-1220 are to be examined under the requirements of Category B-P in Table IWB-2500. These components are addressed in the "Hydro" Section of this program.

Relief Request Bases to IWB are found in back portion of this section.

Note: Drawings identified as "5920" drawings are not included in this book. They are maintained on site in the Main Print File.

1277 220

APPLICATION OF CODE EXEMPTIONS

Safety Class 1 Components exempted from examination according to Section XI, Sub-Sub article IWB-1220 are as follows:

System or Component	Exemption Criteria
1. Reactor Instrument Lines	IWB - 1220 (b)(3)
2. Reactor Drain Line (N15)	IWB - 1220 (b)(1)
3. Cleanup Water Line CUW - 18	IWB - 1220 (b)(1)
4. Nozzle N10 Instrument	IWB - 1220 (b)(1)
5. Steam Drain Lines	IWB - 1220 (b)(1)
6. Nozzle N7 Instrument	IWB - 1220 (b)(1)
7. Recirc. Drain Lines	IWB - 1220 (b)(1)

Notes: Liquid filled lines below 2" schedule 80 and steam filled below 4" schedule 80 meet the exemption criteria of IWB - 1220 (b)(1).

All components falling under the exemption criteria of IWB-1200 are examined under the System Pressure Tests of IWB-5000. Refer to the "Hydro" Section of this program.

RELIEF REQUEST BASIS Numbers: B-1
B-2

NUMBER: B-1

COMPONENT: Longitudinal & Circumferential shell welds in Core Beltline Region.

CATEGORY: B-A

CLASS: 1

TEST REQUIREMENT: Volumetric

BASIS FOR RELIEF: Welds are inaccessible due to vessel insulation/ bio-shield configuration. Approximately 8 1/2" from outside of insulation to inner shield wall. Insulation is approximately 4" thick and 1" from vessel wall. Access to insulation for removal is through nozzle ports (away from beltline region).

ALTERNATE TESTING: Vessel hydrostatically tested before start-up after each refueling outage.

[Refer to Mirror Insulation Print 500299002C]

NUMBER: B-2

COMPONENT: Circumferential and Meridian Seam Welds on Bottom Head

CATEGORY: B-B

CLASS: 1

TEST REQUIREMENT: Volumetric

BASIS FOR RELIEF: Bottom Head is inaccessible due to mirror insulation configuration. Insulation rests above a steel support frame under the bottom head. CRD penetration protruding down through framework also limits access to head.

ALTERNATE TESTING: Vessel is hydrostatically tested before start-up after each refueling outage.

RELIEF REQUEST BASIS Numbers: B-3
B-4

NUMBER: B-3

COMPONENT: Primary nozzle to vessel weld. Nozzle N-15

CLASS: 1

FUNCTION: Vessel drain nozzle

TEST REQUIREMENT: Volumetric

BASIS FOR RELIEF: Nozzle N-15 is located just off the center of the bottom head. N-15 is inaccessible due to mirror insulation configuration and the nozzle's location amidst a forrest of control rod drives.

ALTERNATE TESTING: This nozzle is included as an instrument line and is visually inspected for leakage during the vessel hydro every refueling outage.

NUMBER: B-4

COMPONENT: Integrally welded supports

CATEGORY: B-K-1

CLASS: 1

TEST REQUIREMENT: Volumetric

BASIS FOR RELIEF: Supports are attached by partial penetration welds

ALTERNATE TESTING: Surface and visual exams will replace volumetric.

1277 341

RELIEF REQUEST BASIS Numbers: B-5
B-6

NUMBER: B-5

COMPONENT: Valve Bodies

CATEGORY: B-M-2

CLASS: 1

TEST REQUIREMENT: Visual

BASIS FOR RELIEF: Disassembling a valve for the sole purpose of performing a visual inspection imposes an undue burden on the plant and may increase the probability of valve failure.

ALTERNATE TESTING: Valve bodies shall be inspected if and when valves are disassembled for maintenance or other purposes.

NUMBER: B-6

COMPONENT: P-18-1A & P-18-1B (pump casings)

CATEGORY: B-L-2

CLASS: 1

TEST REQUIREMENT: Visual

BASIS FOR RELIEF: Disassembly of the pump for the sole purpose of visual examination of the casing imposes an undue burden on the plant and may increase the probability of pump failure.

ALTERNATE TESTING: Pump casings will be inspected if and when the pumps are disassembled.

1277 342

NUMBER: B-7

COMPONENT: Piping to fitting welds

CATEGORY: B-F; B-J & C-F; C-G

CLASS: 1 & 2

FUNCTION: Circumferential weld joints between piping and valves, elbows, reducers, etc.

TEST REQUIREMENT: Volumetric

BASIS FOR RELIEF: Ultrasonic examination can be performed from the pipe side of the weld only. Geometries of the fittings prohibit meaningful ultrasonic results.

ALTERNATE TESTING: Acceptable test results from the pipe side of the weld and base metal.

1277 343

RELIEF REQUEST BASIS Numbers: B-8

NUMBER: B-8

COMPONENT: Reactor vessel integrally welded supports

CATEGORY: B-H

CLASS: 1

TEST REQUIREMENT: Volumetric

BASIS FOR RELIEF: The reactor vessel skirt is uninspectable for two primary reasons.

1. The covering mirror insulation is structured in a manner that is not removable since there are many support members and locked, interconnecting insulation pieces. The weld is available only through a removable inspection panel that is nine feet below, with 8-1/2" of parallel wall clearance between weld and insulation.
2. Radiation levels inside the bio-shield wall, against the bottom head are 1-10 r/hr. Estimated personnel exposures would be 10-100 M/rem during the insulation removal, inspection and insulation replacement process.

The reactor vessel stabilizer brackets are attached with vee-prep fillet-type welds. An ultrasonic inspection of these welds would not be useful. The bottom side of the stabilizer weld is inaccessible due to its location at the top of the bio-shield wall.

ALTERNATE TESTING: The upper portion of each stabilizer shall be visually and surface inspected each inspection interval.

1278 001

NUMBER: C-1

COMPONENT: RHR Heat Exchangers' Nozzle Welds

CATEGORY: C-B

CLASS: 2

TEST REQUIREMENT: Volumetric

BASIS FOR RELIEF: Nozzle design configuration prohibits useful volumetric examination of the nozzle welds since the weld is 100% covered by a reinforcement saddle. Refer to detail "A" of drawing I-20.

ALTERNATE TESTING: Surface and visual examinations shall be performed on the reinforcement saddle-to-nozzle and reinforcement saddle-to-vessel welds.

1278 002

NUMBER: H-9

SYSTEM: Sampling LINE(S): Containment air

SAFETY CLASS: 2 & 3

BASIS FOR RELIEF: System is designed for air. All lines are less than 1" and have no access for a test connection.

ALTERNATE TESTING: Containment isolation piping valves are tested during the 44 psig Type A test. Other portions are in a normally operating condition. Flow meters detect any integrity problems.

NUMBER: H-10

SYSTEM: Fuel Pool Cooling and Clean-up LINE(S): FPC-34

SAFETY CLASS: 3

FUNCTION: Provide water from condensate transfer system

BASIS FOR RELIEF: Isolation beyond V19-24 requires an extensive tie-up of the condensate transfer system. This system is required to provide emergency make-up to the spent fuel pool, as well as various other make-up, flushing and backwashing functions, during all modes of operation. *

ALTERNATE TESTING: FPC-34 is under a constant "dead leg" pressure from the condensate system. (V19-24 is normally closed.) Any leakage from this line would show as flow to the fuel pool cooling system.

RELIEF REQUEST BASIS Numbers: H-11
H-12

NUMBER: H-11

SYSTEM: Service Water LINE(S): Full system

SAFETY CLASS: 3

FUNCTION: System provides cooling to remove plant waste heat.

BASIS FOR RELIEF: System cannot be hydrostatically tested because it is used to dissipate heat loads during all modes of operation. During power operation, service water is required to remove heat from main recirculation pumps. At shutdown, service water is used to supply cooling water to shutdown cooling equipment.

ALTERNATE TESTING: The visible portions of the service water system are observed during normal operation. The system runs approximately 100% of the time.

NUMBER: H-12

SYSTEM: Diesel Air Start LINE(S): Full system

SAFETY CLASS: 3

FUNCTION: System provides high pressure air to diesel generators to assist crank rotation in diesel starting.

BASIS FOR RELIEF: System is designed for air. The introduction of water may be detrimental to the diesels and system operation.

ALTERNATE TESTING: The air start system is constantly under a normal "operating" pressure of 250 psi, which is checked on every operator working shift.

1278 004

INSERVICE OPERABILITY TESTING PROGRAM FOR VALVES

All safety related valves that are necessary to safely shutdown the plant or mitigate the consequences of an accident, will be tested in accordance with the Inservice Inspection Program. The valves have been separated into five major categories which specify the required tests as follows:

Category A - Valves for which seat leakage is limited to a specific maximum amount in the closed position for fulfillment of their function. (IWV - 2400 and IWV - 3420.)

Tests:

Q - Exercise the valve to the position required to fulfill its function every 3 months.

MT - Measure stroke time at the same frequency of the valve exercise (not more often than 3 months).

LT - Leak test the valves every refueling outage.

Category B - Valves for which seat leakage in the closed position is inconsequential for fulfillment of their function. (IWV - 3400)

Tests:

Q - Exercise the valve to the position required to fulfill its function every 3 months.

MT - Measure stroke time at the same frequency of the valve exercise (not more often than 3 months).

Category C - Valves which are self-actuating in response to some system characteristic, such as pressure (relief valves)

1278 005

or flow direction (check valves). (IWV - 3500)

Tests:

CV - Exercise to the position required to fulfill its function every 3 months. (IWV - 3520)

SRV - Test safety and relief valves in accordance with ASME PTC 25.2-1966 approximately once every five years. (IWV - 3510)

Category D - Valves which are actuated by an energy source capable of only one operation, such as rupture disks or explosive actuated valves. (IWV - 3600)

Tests:

DT - For explosive valves - remove, fire and replace 20% of the charges every 2 years. (IWV - 3610)
For rupture disks - test in accordance with the manufacturer's instructions. (IWV - 3620)

Category E - Valves which are normally locked (or sealed) open or locked (or sealed) closed to fulfill their function. (IWV - 3700)

Tests:

ET - Operational checks, with record entries, before and after operations are required to verify valve is locked or sealed in the proper position.

Specific procedural requirements, exceptions, and acceptance criteria are described in Section XI, sub-section IWV.

Procedures and records will be developed, evaluated, and maintained in accordance with the requirements of this sub-section.

1278 006

OTHER SYMBOLS USED IN THE FOLLOWING TABLES

Test Requirements:

LTJ - Leak Rate Test, documentation and analysis will be completed in accordance with 10 CFR 50, Appendix J.

RR - Exercise valve for operability every refueling outage.

CS - Exercise valve for operability every cold shutdown.

M - Valve will be exercised monthly.

L - Other leak test.

Valve Types:

GA - Gate valve

GL - Globe valve

CK - Check valve

EFC - Excess flow check valve

RV - Relief or safety valve

RD - Rupture disk

BF - Butterfly valve

BL - Ball valve

Actuator Types:

AO - Air operator

MO - Motor operator

SO - Solenoid operator

M - Manual

EXP - Explosive

HO - Hydraulic operator

Relief Request Bases to section IWV are found in the back portion of this section.

NOTE: Relief Request Bases GV-1, GV-2 and GV-3 apply generally to subsection IWV.

1278 031

V - 27

Rev 2

Relief Request Basis

NUMBER: V1

SYSTEM: Recirculation pump

VALVE: 2-2-7A/B, 2-2-8A/B

CATEGORY: C

CLASS: 2

FUNCTION: Excess flow check valves for instrument isolation

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves can only be verified to shut by leak testing which is performed during the refueling outage hydrostatic test. Valves cannot be exercised shut during power operation since shutting these would isolate instrumentation required for power operation.

ALTERNATE TESTING: Valves will be functionally tested each refueling outage.

Relief Request Basis

NUMBER: V2

SYSTEM: Instrument and Service Air

VALVE: V72-37A/B V72-103A/B

CATEGORY: A,C

CLASS: 2

FUNCTION: Primary Containment Isolation

TEST REQUIREMENT: CV, LT

BASIS FOR RELIEF: Valves are normally closed and passive during an accident. There is no means available to perform either test.

ALTERNATE TESTING: Valves are evaluated for leak tightness during the performance of each type "A" leak test. Further testing of these valves, if appropriate, will be implemented when the type "A" rest results are evaluated.

1278 033

Relief Request Basis

NUMBER: V3

SYSTEM: Service and Instrument Air

VALVE: V72-38A/B, V72-89B/C

CATEGORY: A

CLASS: 2

FUNCTION: Primary Containment Isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Primary containment isolation valves are covered by 10 CFR 50, Appendix J, via Technical Specification Section 4.7.2b and additional administrative requirements.

ALTERNATE TESTING: Leak testing in accordance with Appendix J.

1278 034

Relief Request Basis

NUMBER: V4

SYSTEM: Service and Instrument Air

VALVE: V72-89B/C

CATEGORY: C

CLASS: 2

FUNCTION: Primary Containment Isolation

TEST REQUIREMENT: CV

BASIS FOR RELIEF: There are no means available to test the valves in the manner prescribed by IWV-3520.

ALTERNATE TESTING: Leak testing in accordance with Appendix J.

1278 035

Relief Request Basis

NUMBER: V5

SYSTEM: Nuclear Boiler

VALVE: SR 2-14A-D

CATEGORY: C

CLASS: 3

FUNCTION: Relief Valve Discharge line vacuum breaker

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves cannot be exercised during power operation since valves are inside the drywell and are inaccessable when at power.

ALTERNATE TESTING: Valves will be manually exercised during cold shutdowns.

1278 036

Relief Request Basis

NUMBER: V6

SYSTEM: Nuclear Boiler

VALVE: V2-28A/B

CATEGORY: A

CLASS: 1

FUNCTION: Primary Containment Isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Valves presently exempted, per Tech. Spec. table 4.7.2 from leak testing.

ALTERNATE TESTING: None

1278 037

Relief Request Basis

NUMBER: 27

SYSTEM: Nuclear Boiler

VALVE: V2-39, V2-40, V2-74, V2-77, V2-80A-D, V2-86A-D

CATEGORY: A

CLASS: 1

FUNCTION: Primary Containment Isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Primary containment isolation valves are covered by 10 CFR 50, Appendix J, via technical specification section 4.7.2.b and additional administrative requirements.

ALTERNATE TESTING: Leak testing in accordance with Appendix J.

1278 038

Relief Request Basis

NUMBER: V8

SYSTEM: Nuclear Boiler

VALVE: V2-53A/B, V2-54A/B

CATEGORY: B

CLASS: 1

FUNCTION: Recirculation pump discharge and bypass valve - required for LPCI operation.

TEST REQUIREMENT: Q

BASIS FOR RELIEF: Valve exercising during power operation would require a reactor trip.

ALTERNATE TESTING: Valves will be full stroke exercised during cold shutdowns of duration greater than 48 hours and during refueling outages.

1278 039

Relief Request Basis

NUMBER: V9

SYSTEM: Nuclear Boiler

VALVE: RV2-71A/B

CATEGORY: B

CLASS: 1

FUNCTION: Automatic depressurization

TEST REQUIREMENT: Q

BASIS FOR RELIEF: Valves cannot be exercised during power operation since failure in the open position would require tripping the reactor. Also, live steam would be discharged to the suppression pool which would heat the water and pressurize the containment. This causes undue structural stresses in the containment. Valves cannot be exercised during cold shutdowns since steam is required to stroke the main piston in the valve. Experience in safety and relief valve operation shows that testing 50% of the valves per refueling outage is adequate to detect failures or deterioration. Valve design prohibits full stroke exercising.

ALTERNATE TESTING: During each operation cycle, each relief valve will be manually opened with the reactor at low pressure until the thermocouple downstream of the valve indicates fluid is flowing from the valve.

1278 040

Relief Request Basis

NUMBER: V10

SYSTEM: Nuclear Boiler

VALVE: V2-74, V2-77

CATEGORY: A

CLASS: 1

FUNCTION: Primary Containment Isolation

TEST REQUIREMENT: Q, MT

BASIS FOR RELIEF: Valves are normally closed and remain passive in the event of an accident. A quarterly test frequency is not required for passive valves.

ALTERNATE TESTING: None

1278 041

Relief Request Basis

NUMBER: V11

SYSTEM: Nuclear Boiler

VALVE: V2-27B, V2-96B

CATEGORY: C

CLASS: 2

FUNCTION: Feedwater checks for HPCI/RCIC operation.

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves are required to be open during power operation. Shutting these valves will cause a reactor trip. Testing via the HPCI/RCIC systems would cause thermal shocking of the feedwater nozzles and could result in damage to reactor internals. Testing the valves during cold shutdown would require removing the only mechanism of vessel level control (via reactor cleanup system).

ALTERNATE TESTING: Valves will be verified shut during the refueling outages.

1278 042

Relief Request Basis

NUMBER: V12

SYSTEM: Nuclear Boiler

VALVE: 2-3-23, 2-62-A-D, 2-64-A-D, 2-73-A-H, 2-305-A/B

CATEGORY: C

CLASS: 2

FUNCTION: Excess flow check valves for instrument isolation

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves can only be verified to shut by leak testing which is performed during the refueling outage hydrostatic test. Valves cannot be exercised shut during power operation since shutting these would isolate instrumentation required for power operation.

ALTERNATE TESTING: Valves will be functionally tested each refueling outage.

1278 043

Relief Request Basis

NUMBER: V13

SYSTEM: Core Spray

VALVE: V14-13A/B

CATEGORY: C

CLASS: 2

FUNCTION: Injection check valve

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves cannot be exercised manually since valves are located inside the primary containment. Valves cannot be exercised with flow since pump discharge pressure cannot overcome reactor pressure.

ALTERNATE TESTING: These valves will be full stroke exercised during cold shutdowns when the drywell is accessible and during refueling outages.

1278 044

Relief Request Basis

NUMBER: V14

SYSTEM: Core Spray

VALVE: 14-31 A/B

CATEGORY: C

CLASS: 2

FUNCTION: Excess flow check valves for instrument isolation

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves can only be verified to shut by leak testing which is performed during the refueling outage hydrostatic test. Valves cannot be exercised shut during power operation since shutting these would isolate instrumentation required for power operation.

ALTERNATE TESTING: Valves will be functionally tested each refueling outage.

1278 045

Relief Request Basis

NUMBER: V15

SYSTEM: High Pressure Coolant Injection

VALVE: V23-15, V23-16

CATEGORY: A

CLASS: 1

FUNCTION: HPCI steam line isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Primary containment isolation valves are covered by 10 CFR 50, Appendix J, via technical specification section 4.7.2b and additional administrative requirements.

ALTERNATE TESTING: Leak testing in accordance with Appendix J.

Relief Request Basis

NUMBER: V16

SYSTEM: High Pressure Coolant Injection

VALVE: V23-15, V23-16, V23-17, V23-19, V23-20

CATEGORY: A or B

CLASS: 1 or 2

FUNCTION: Injection mode valves

TEST REQUIREMENT: Q

BASIS FOR RELIEF: Valves cannot be exercised during power operation since repositioning these valves would render the HPCI system inoperable if the valve failed in an unconservative position.

ALTERNATE TESTING: Valves will be full stroke exercised during cold shutdowns and refueling outages.

Relief Request Basis

NUMBER: V17

SYSTEM: High Pressure Coolant Injection

VALVE: V23-18

CATEGORY: C

CLASS: 2

FUNCTION: Injection check valve

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valve cannot be exercised during power operation since flow through this valve must be injected into the reactor coolant system. This would thermally shock the reactor nozzles. The cold water injection would also cause a reactivity excursion. Manual valve operation is not possible during power operation since the valve is located in the steam tunnel which is inaccessible.

ALTERNATE TESTING: Valve will be manually fully stroke exercised during cold shutdowns.

1278 048

Relief Request Basis

NUMBER: V18

SYSTEM: High Pressure Coolant Injection

VALVE: V23-65, SSC-23-12, V23-32

CATEGORY: C

CLASS: 2

FUNCTION: Injection mode valves

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves cannot be full stroke exercised quarterly since a full flow HPCI test adds significant heat to the suppression chamber (via turbine exhaust). This could heat the suppression chamber to greater than the temperature limits. The HPCI pump cannot be run during cold shutdown since steam is not available to run the turbine. Approximately 150 psi of steam is required to run a full flow test of the HPCI pump. This steam is not always available prior to an unplanned cold shutdown.

ALTERNATE TESTING: Valves will be full stroke exercised during the shutdown of the plant when entering a refueling outage or a planned cold shutdown. Valves will be partial stroke exercised quarterly.

1278 049

Relief Request Basis

NUMBER: V19

SYSTEM: High Pressure Coolant Injection

VALVE: SL 23-37 A-D

CATEGORY: C

CLASS: 2

FUNCTION: Excess flow check valves for instrument isolation

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves can only be verified to shut by leak testing which is performed during the refueling outage hydrostatic test. Valves cannot be exercised shut during power operation since shutting these would isolate instrumentation required for power operation.

ALTERNATE TESTING: Valves will be functionally tested each refueling outage.

1278 050

Releif Request Basis

NUMBER: V20

SYSTEM: High Pressure Coolant Injection

VALVE: V23-61

CATEGORY: C

CLASS: 2

FUNCTION: Torus suction check valve

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valve cannot be full stroke exercised during power operation since there is no full flow test loop available to recirculate the water back to the torus. There are no means to manually stroke the valve. Valve cannot be stroked via a system injection into the reactor since that would result in a reactivity excursion and potentially thermally shocking the reactor nozzles.

ALTERNATE TESTING: Valve will be verified to open freely each cold shutdown and refuel outages.

Relief Request Basis

NUMBER: V21

SYSTEM: High Pressure Coolant Injection

VALVE: PCV 23-50

CATEGORY: B

CLASS: 2

FUNCTION: Pressure control

TEST REQUIREMENT: MT

BASIS FOR RELIEF: Valve is a modulating type valve. Stroke time is not an appropriate reference parameter.

ALTERNATE TESTING: Proper valve operation is verified through normal system operation during the pump tests.

1278 052

Relief Request Basis

NUMBER: V22

SYSTEM: Control Rod Drive Hydraulic

VALVE: V3-13-114, V3-13-126, V3-13-127

CATEGORY: B or C

CLASS: 2

FUNCTION: Control rod drive scram

TEST REQUIREMENT: Q or CV

BASIS FOR RELIEF: Exercising these valves during power operation would require scramming the plant or an undesirable reactor transient.

ALTERNATE TESTING: Since scram insertion times are representative of valve operability and stroke times, alternate testing will be performed in accordance with Tech. Spec. section 4.3.C.1 and 2. This section requires that all control rods be subjected to scram-time measurements on a refueling outage basis. Also, this section requires that 50% of the control rods be measured for scram times every 16 to 32 weeks. An evaluation is required that provides reasonable assurance that proper control rod drive performance is being maintained. These tests adequately verify valve operability and stroke times.

1278 053

Relief Request Basis

NUMBER: V22A

SYSTEM: Control Rod Drive Hydraulic

VALVE: V3-181

CATEGORY: A

CLASS: 3

FUNCTION: Primary Containment Isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Primary containment isolation valves are covered by 10 CFR 50, Appendix J, via Tech. Spec. section 4.7.2b and additional administrative requirements.

ALTERNATE TESTING: Leak testing in accordance with Appendix J.

1278 054

Relief Request Basis

NUMBER: V22B

SYSTEM Control Rod Drive Hydraulic

VALVE: V3-181

CATEGORY: C

CLASS: 3

FUNCTION: CRD Return to RWCU System

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valve cannot be exercised during power operation since this would require isolating and venting a portion of the CRD system. This would cause hydraulic instability throughout the system. This situation is potentially unsafe until the system can be rebalanced and the rod strokes retimed. This cannot be done during power operation.

ALTERNATE TESTING: Valve will be verified to close during cold shutdowns.

1278 055

Relief Request Basis

NUMBER: V23

SYSTEM: Standby Liquid Control

VALVE: V11-16, V11-17

CATEGORY: A

CLASS: 1

FUNCTION: Primary Containment Isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Valves presently exempted, per Tech. Spec. table 4.7.2 from leak testing.

ALTERNATE TESTING: None

1278 056

Relief Request Basis

NUMBER: V24

SYSTEM: Standby Liquid Control

VALVE: V11-16, V11-17

CATEGORY: C

CLASS:

FUNCTION: SLC injection into reactor

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Exercising these valves during power operation would require injecting borated water into the reactor coolant system. This would create a reactivity excursion and potential for reactor trip. Injection of demineralized water would require removing the system from service to clean the borated solution from the piping and replacing the explosive actuated valves. This system is required for power operation. Performing the demin. water test during cold shutdowns is impractical since extensive flushing of the boron from the system for several days is required to reduce the boron concentration to a level compatible for injection into the reactor coolant system.

ALTERNATE TESTING: Valves will be full stroke exercised during refueling outages.

1278 05

Relief Request Basis

NUMBER: V25

SYSTEM: Residual Heat Removal

VALVE: V10-17, V10-18, V10-26A/B, V10-31A/B, V10-32, V10-33, V10-34A/B, V10-38A/B, V10-39A/B

CATEGORY: A

CLASS: 1 or 2

FUNCTION: Primary containment isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Valves presently exempted, per Tech. Spec. table 4.7.2 from leak testing.

ALTERNATE TESTING: None

1278 058

Relief Request Basis

NUMBER: V26

SYSTEM: Residual Heat Removal

VALVE: V10-46 A/B

CATEGORY: C

CLASS: 1

FUNCTION: LPCI injection check

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves cannot be exercised during power operation since the valves are located inside the primary containment. Exercising the valves by system flow is not possible during power operation since pump discharge is unable to overcome reactor coolant system pressure.

ALTERNATE TESTING: Valves will be full stroke exercised during cold shutdowns when the drywell is accessible and during refueling outages.

1278 059

Relief Request Basis

NUMBER: V27

SYSTEM: Residual Heat Removal

VALVE: V10-57, V10-66

CATEGORY: A

CLASS: 2

FUNCTION: Primary containment isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Primary containment isolation valves are covered by 10 CFR 50, Appendix J, via Technical Specification Section 4.7.2b and additional administrative requirements.

ALTERNATE TESTING: Leak testing in accordance with Appendix J.

1278 060

Relief Request Basis

NUMBER: V28

SYSTEM: Residual Heat Removal

VALVE: V10-89 A/B

CATEGORY: B

CLASS: 3

FUNCTION: Flow control

TEST REQUIREMENT: MT

BASIS FOR RELIEF: Valve is a modulating type valve. Stroke time is not an appropriate reference parameter.

ALTERNATE TESTING: Proper valve operation is verified through normal system operation during the pump tests.

1278 061

Relief Request Basis

NUMBER: V29

SYSTEM: Reactor Core Isolation Cooling

VALVE: V13-15, V13-16

CATEGORY: A

CLASS: 1

FUNCTION: RCIC steam line isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Primary containment isolation valves are covered by 10 CFR 50, Appendix J, Tech. Spec, section 4.7.2b and additional administrative requirements.

ALTERNATE TESTING: Leak testing in accordance with Appendix J.

1278 062

Relief Request Basis

NUMBER: V30

SYSTEM: Reactor Core Isolation Cooling

VALVE: V13-15, V13-16, V13-18, V13-20, V13-21, V13-27

CATEGORY: A or B

CLASS: 1 or 2

FUNCTION: Injection mode valves

TEST REQUIREMENT: Q

BASIS FOR RELIEF: Valves cannot be exercised during power operation since repositioning these valves would render the RCIC system inoperable if the valve failed in an unconservative position.

ALTERNATE TESTING: Valves will be full stroke exercised during cold shutdowns and refueling outages.

1278 063

Relief Request Basis

NUMBER: V31

SYSTEM: Reactor Core Isolation Cooling

VALVE: V13-22

CATEGORY: C

CLASS: 2

FUNCTION: Injection check valve

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valve cannot be exercised during power operation since flow through this valve must be injected into the reactor coolant system. This would thermally shock the reactor nozzles. The cold water injection would also cause a reactivity excursion. Manual valve operation is not possible during power operation since the valve is located in the steam tunnel which is inaccessible.

ALTERNATE TESTING: Valve will be manually fully stroke exercised during cold shutdowns.

1278 064

Relief Request Basis

NUMBER: V32

SYSTEM: Reactor Core Isolation Cooling

VALVE: SL 13-55 A-D

CATEGORY: C

CLASS: 2

FUNCTION: Excess flow check valves for instrument isolation

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valves can only be verified to shut by leak testing which is performed during the refueling outage hydrostatic test. Valves cannot be exercised shut during power operation since shutting these would isolate instrumentation required for power operation.

ALTERNATE TESTING: Valves will be functionally tested each refueling outage.

1278 065

Relief Request Basis

NUMBER: V33

SYSTEM: Reactor Core Isolation Cooling

VALVE: V13-40

CATEGORY: C

CLASS: 2

FUNCTION: Torus suction check valve

TEST REQUIREMENT: CV

BASIS FOR RELIEF: Valve cannot be full stroke exercised during power operation since there is no full flow test loop available to recirculate the water back to the torus. There are no means to manually stroke the valve. Valve cannot be stroked via a system injection into the reactor since that would result in a reactivity excursion and potentially thermally shocking the reactor nozzles.

ALTERNATE TESTING: Valve will be verified to open freely each cold shutdown and refuel outages.

1278 066

Relief Request Basis

NUMBER: V34

SYSTEM: Reactor Core Isolation Cooling

VALVE: PCV 13-23, Turb. gov.

CATEGORY: B

CLASS: 2

FUNCTION: Modulating valves

TEST REQUIREMENT: MT

BASIS FOR RELIEF: Valve is a modulating type valve. Stroke time is not an appropriate reference parameter.

ALTERNATE TESTING: Proper valve operation is verified through normal system operation during the pump tests.

1278 067

Relief Request Basis

NUMBER: V35

SYSTEM: Primary Containment and Atmosphere Control

VALVE: V16-19-5 A to J

CATEGORY: A

CLASS: 2

FUNCTION: Torus-drywell vacuum breakers

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Valves cannot be leak tested individually

ALTERNATE TESTING: Leak test will be done which will demonstrate that with an initial differential pressure of not less than 1.0 psi, the differential pressure decay rate shall not exceed the equivalent of the leakage rate through a 1-inch orifice.

1278 068

Relief Request Basis

NUMBER: V36

SYSTEM: Primary Containment and Atmosphere Control

VALVE: SB 16-19-6 A/B, SB16-19-7 A/B, SB16-19-8, SB16-19-9, SB16-19-10 SB16-19-11 A/B, V16-19-12A/B, V16-20-20, V16-20-22A/B, V16-19-23

CATEGORY: A

CLASS: 2

FUNCTION: Primary containment isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Primary containment isolation valves are covered by 10 CFR 50, Appendix J, via Tech. Spec. section 4.7.2b and additional administrative requirements.

ALTERNATE TESTING: Leak testing in accordance with Appendix J.

1278 069

Relief Request Basis

NUMBER: V37

SYSTEM: Primary Containment and Atmosphere Control

NUMBER: V47

SYSTEM: TIP

VALVE: Ball A-C, Solenoid

CATEGORY: A

CLASS: 2

FUNCTION: Primary containment isolation

TEST REQUIREMENT: LT

BASIS FOR RELIEF: Valves are normally closed and passive during an accident. There is no means available to perform a leak test.

ALTERNATE TESTING: Valves will be evaluated for leak tightness during the performance of each type "A" leak test. Further testing of these valves, if appropriate, will be implemented when the type "A" test results are evaluated.

1278 080

Relief Request Basis

NUMBER: V48

SYSTEM: TIP

VALVE: Solenoid

CATEGORY: A

CLASS: 2

FUNCTION: Primary containment isolation

TEST REQUIREMENT: MT

BASIS FOR RELIEF: Valve is a 1/2 inch solenoid valve. Timing the stroke is not possible.

ALTERNATE TESTING: None

1278 081

Relief Request Basis

NUMBER: GV-1

CODE PARAGRAPHS: IWV-3410 (C) (3) concerning an increase in test frequency.

BASIS FOR RELIEF: As defined in the Inservice Test Program, there is sufficient justification to test certain valves on either a cold shutdown or a refueling outage basis. The test frequency of these valves cannot be increased without jeopardizing plant operations.

ALTERNATIVE: If any of the valves that are tested quarterly fail, the test frequency will be increased in accordance with the provisions of the referenced paragraph. If any of the valves that are tested on a cold shutdown basis fail, the valves will be tested each cold shutdown, not to exceed once every month until corrective action is taken.

1278 082

Relief Request Basis

NUMBER: GV-2

CODE PARAGRAPHS: IWV-3410 (g1 and LWV-3520(c) concerning corrective action prior to startup.

BASIS FOR RELIEF: The Vermont Yankee Technical Sepcifications describes various limiting conditions for operation. These are more appropriately used as a basis for plant startup than are the above referenced requirements.

ALTERNATIVE: The Technical Specifications' limiting conditions for operation will be used as the basis to determine if the plant can startup.

1278 083

Relief Request Basis

NUMBER: GV-3

CODE PARAGRAPHS: IWV-3410 and IWV-3520 concerning the definition of "cold shutdown".

BASIS FOR RELIEF: Since operations personnel are faced with many activities associated with and maintaining the plant in cold shutdown conditions, the operators require some amount of flexibility in scheduling certain surveillance testing. Surveillance testing alone should not be a cause for the plant to remain in a shutdown condition.

ALTERNATIVE: "Cold Shutdown Testing" will be defined as commencing the required testing not later than 48 hours after cold shutdown is achieved. Testing must continue until complete or the plant is ready to return to power. Completion of all valve testing is not a prerequisite to return to power. Any testing not completed at one cold shutdown should be performed during subsequent cold shutdowns to meet the code specified testing frequency.

1278 084

NOTES

1. Valves are continuously tested to their full open position via normal feedwater flow into the reactor vessel. These valves are required to open for HPCI/RCIC operation.
2. A minimum of 1/2 of all safety valves shall be bench-checked or replaced with a bench-checked valve each refueling outage. Both valves shall be checked or replaced every two refueling outages.
3. A minimum of 1/2 of all relief valves shall be bench-checked or replaced with a bench-checked valve each refueling outage. All four valves shall be checked or replaced every two refueling outages.
4. Prior to quarterly exercise and timing tests, decrease reactor power to less than 50 percent. At least twice a week the MSIV's shall be exercised by partial closure and subsequent reopening.
5. During each refueling outage, explode one of the three charges manufactured in the same batch to verify proper function. Then install the untested charges in the explosion valves.
6. Valves are verified to open by observing a decrease in pump discharge pressure.
7. Each refueling outage each valve will be tested to determine that the force required to open each valve from fully closed to fully open.
8. Each refueling outage each valve will be tested to determine that the force required to open the vacuum breaker does not exceed the force specified by Tech. Spec. section 3.7.A.5.a and each vacuum breaker will be inspected and verified to meet the design requirements.

85

INSERVICE OPERABILITY TESTING PROGRAM FOR PUMPS

All safety related pumps that are provided with an emergency power source will be tested in accordance with the Inservice Inspection Program.

Specific procedural requirements, exceptions, and acceptance criteria are as described in Section XI, subsection IWP. Procedures and records will be developed, evaluated, and maintained in accordance with the requirements of this subsection.

Symbols used in the following tables:

M - Monthly Test

NP - Not Possible

V - Variable Resistance System

F - Fixed Resistance System

Relief Request Basis' are located in the back portion of this section.

ALTERNATIVE TESTING: None

1278 094

Relief Request Basis

NUMBER: P8

SYSTEM: Fuel Oil Transfer

PUMP: P>Z-1A/B

CLASS: 3

TEST REQUIREMENT: Bearing temperature per IWP-3300

BASIS FOR RELIEF: Per IWP-3500, bearing temperature measurements require that each pump be run until the bearing temperatures stabilize... A bearing temperature is considered stable when three successive readings taken at ten minute intervals do not vary by more than 3%. The fuel oil transfer pump operability test can only be performed when the diesel is undergoing testing. When low level is sensed in the day tank, the fuel oil transfer pumps provide the make-up. This normally takes less than 15 minutes. This is not sufficient time to record a meaningful bearing temperature.

ALTERNATIVE TESTING: None

1278 095

NOTES

1. Q is calculated using a computer program based on the pump total discharge head and the head/capacity curve. Pi is based on the river elevation.
2. Each refueling outage, conduct a LPCI flow test that demonstrates that each LPCI pump delivers 7450 $\pm$ 150 gpm (vessel to vessel).
3. Each operating cycle, demonstrate that the HPCI system will deliver at least 4250 gpm at normal operating pressure (recirculate to the condensate storage tank).
4. Pi will be calculated based on the level in the test tank. Q will be calculated based on the decrease in volume of the test tank per time period.
5. Each refueling outage, conduct a core spray flow rate test that demonstrates that each pump will deliver at least 3000 gpm against a system head of 120 psig (torus to torus).
6. Every three months, conduct a flow rate test that demonstrates that the RCIC system will deliver at least 400 gpm at normal operating pressure (recirculate to the condensate storage tank).

1278 096
