

T

QUAD CITIES STATION
RADIOACTIVE WASTE, ENVIRONMENTAL MONITORING AND
OCCUPATIONAL PERSONNEL RADIATION EXPOSURE

JANUARY THROUGH JUNE 1977

EXCERPTS

August 1977

1625 282

(12) 7912190 152

SUMMARY

Gaseous and liquid effluents for the period remained at a fraction of the Technical Specification limits. Calculations of environmental concentrations based on effluent, Mississippi River flow, and meteorological data for the period indicate that consumption by the public of radionuclides attributable to the plant will not exceed the quantity of those radionuclides that result from continuous exposure to the concentration values listed in Appendix B, Table II, of 10CFR20. Gamma radiation exposure from noble gases released to the atmosphere represented the critical pathway for the period with a maximum individual dose estimated to be 0.04 mrem for the six-month period, when a shielding and occupancy factor to two is assumed. Environmental monitoring results confirm that dose via other pathways was not significant.

1.0 EFFLUENTS

1.1 GASEOUS EFFLUENTS TO THE ATMOSPHERE

Measured concentrations and isotopic composition of noble gases, radioiodine, and particulate radioactivity released to the atmosphere during the period January to June 1977, are listed in Table 1.1-1. A six-month total of 1.65×10^4 curies of noble gases was released during the period. Average release rates during either quarter of the period did not exceed 0.3% of the Technical Specification limit.

A total of 0.32 curies of I-131 and 1.18 curies of I-133 were released during the six-month period.

Six-month total of 0.28 curies of beta-gamma emitters and 1.1×10^{-5} curies of alpha emitters were released as airborne particulate matter.

1.2 LIQUIDS RELEASED TO MISSISSIPPI RIVER

A total of 7.2×10^6 liters of radioactive liquid wastes containing 1.03 curies (excluding tritium) were discharged from the station. These wastes were released at an average concentration of 3.23×10^{-9} Ci/ml which is 3.2% of the Technical Specification releases limit for unidentified radioactivity. During the same period, 14.7 curies of tritium and 5.3×10^{-4} curies of alpha radioactivity were released. Quarterly release estimates and principal radionuclides in liquid effluents are given in Table 1.2-1.

The maximum concentration of radioactivity, above background, in the Quad Cities Unit 1/2 discharge canal during the period was computed to be 4.09×10^{-7} $\mu\text{Ci}/\text{ml}$.

2.0 SOLID RADIOACTIVE WASTE

The total amount of solid waste packaged for disposal was cubic feet during the six-month period. The total amount of radioactivity involved was calculated to be 6.8×10^3 curies. Solid radioactive wastes were shipped to either Nuclear Engineering Company, Sheffield, Illinois, or Morehead, Kentucky, or Chemical Nuclear Services, Barnwell, So. Carolina. Date, volume and radioactivity of each shipment are shown in Table 2.0-1.
