## General Comment

Please consider this common sense petition! Completely safe and operational plants are closing down because of the silly, lopsided subsidy issues (among others) that result in their continued operation to be non-economical. Our energy security and carbon-free emission generation considerations make these premature closings insane. By at least providing a pathway to re-start the plants if and when their obvious merits become apparent to politicians and environmental activists, the resource that they represent can be realized before more damage is done.
