RE: Oconee Nuclear Station
Docket Nos. 50-269, -270, -287

Dear Mr. Case:

As stated in our letter of April 14, 1978, we are submitting a proposed revision to Section 3.3 of the Oconee Nuclear Station Technical Specifications. The proposed revision incorporates a new Specification (3.3.8) requiring the operability of three HPI pumps for each unit during power operation above 60% FP. This requirement is incorporated as a result of the recent analysis of a postulated 0.04 square foot break at the pump discharge, which was performed assuming emergency core cooling flow by two HPI pumps during a certain phase of the postulated transient (reported by our letter of April 14, 1978). The analysis further indicates that for operation at or below 60% FP only a single train of high pressure injection system is needed to provide the necessary core cooling in the event of such a loss of coolant accident.

Attached are replacement pages of the Oconee Nuclear Station Technical Specifications incorporating these proposed changes. Pursuant to 10CFR50, §50.90, it is requested that these proposed changes be approved. It is pointed out that we are currently meeting the requirements contained in the proposed changes.

The proposed license amendments are considered to constitute one Class III amendment and two Class I amendments since they involve a single issue pertaining to three identical units. Accordingly, the enclosed check in the amount of \$4800.00 is remitted for the license amendment fee.

Very truly yours,

A. C. Thies, Senior Vice President
Production and Transmission
