

Director, Licensing Bureau;

This question is in reference to the Environmental Impact Statement on Dresden One. What are the relative possible positive and/or negative effects of using other decontaminating agents that might not contribute to increased radionuclide ~~activity~~ mobility?

How do strong acids, bases, oxidizing agents or citrates, tartrate, oxalate, gluconate, phosphate, bisulfate, and fluoride measure up to DOW'S NS-1 ?

Sincerely,

Rose H. Lewis
