Dear Sir:

On November 17, 1979, I received a "certificate" describing the results of my body scan, one that was conducted after the Three Mile Island Accident. First of all, I am outraged and appalled at such a worthless document. As a citizen who was extremely concerned about the potentially harmful low level radiation doses that were released three miles from my home, I expected a detailed breakdown of the scanning analysis.

I am a college graduate and hold a masters degree, and I find it difficult to be pacified with the statement, "No radioactivity was found which could have originated at the Three Mile Island Nuclear Power Station." I need further evidence to substantiate that fact. What substances were found in my body and at what levels?

I am requesting that a more extensive report with dosage rates of each substance be sent to my home address. I have an expert in the nuclear field who will assist me in interpreting the numerical findings.

I would greatly appreciate your added research in this matter because it will finally ease my concerns about the radioactive releases.

Thank you for your cooperation and time.

Sincerely,

Barbara J. Heivly
