Nuclear Regulatory Commission

2 p. 485

I understand that the nuclear waste from 3-mile Island is to be shipped to Hanford, Washington for "disposal." And that there will be approximately 2500 trips made - I'm not sure how many miles it is.

Have you considered the probability of accidents along such a long trip? What are the statistics for accidents for 2500 trips the distance of 3-mile Is. to Wash.?

How much radiation might be released along the way? How might this affect fellow travelers, residents along the route, live-stock agriculture water supply etc.

THIS DOCUMENT CONTAINS POOR QUALITY PAGES

I would appreciate an answer to my concerns.

I also would appreciate info on what is done at a nuclear dump. How is this waste disposed of. How safe is the disposal & how long will it be active & a threat to life. I understand that it is long lived. How will we let future generations know of the danger in these areas if there are dramatic changes in our culture?

Sincerely,
