Subject: Potential Deficiency Affecting Foxboro N-E11 and N-E13
Transmitters Containing 10-50mA Type Amplifier
Pt. No. B0142EC
Manufactured between January 1, 1988 and September 1, 1989

Our records indicate that you have received one or more Foxboro Transmitters and/or spare amplifiers of the type listed above. This letter is to advise you of deficiencies in the amplifier requiring replacement of all amplifiers (B0142EC) manufactured from January 1, 1988 through September 1, 1989. The Foxboro Company will provide replacement amplifiers free of charge. Similar model transmitters and amplifiers of the 4-20mA output type are not affected.

The deficiencies are workmanship related consisting of: 1) component leads were incorrectly soldered, and/or 2) improper component lead position and trimming which could lead to grounding or bridging of circuits and possible arcing of a connection, and/or 3) possible omission of a soldered jumper "C".

The workmanship deficiencies have been localized to a particular area of the amplifier board and three specific components and their leads. The components are Q3, an output transistor; CR8, a zener diode; and C3, a capacitor. See the attached Exhibit A, Figures 1 and 2 of this notice which identifies the deficient area and components associated with the deficiencies.

Transmitter operation can be affected in the form of current output oscillations which may suddenly occur because of bridging and/or contact resistance changes from improper connections. In the case of a loose cathode tab connection with the zener case, arcing will occur which will cause current output oscillations. Incorrectly soldered connections and/or a loose zener tab could individually, and in some combinations, cause output oscillations. Some amplifiers shipped as spare parts were missing the "C" jumper. These amplifiers would experience output oscillations immediately upon test powering, thus indicating that the amplifier was unusable.

Transmitters with amplifiers which may have the workmanship deficiencies were processed through manufacturing tests without the output oscillations occurring. However, deficient contact lead integrity can change with the influences of time, temperature,

JEI9
1

Notification-Nuclear

page 2

vibrations and shock; thus a potential problem may or may not surface under normal conditions. Large thermal changes (LOCA's) are of most concern as well as seismic occurrences since these could trigger the transmitter output oscillations.

All amplifiers date coded 2B8801 through 2B8936, whether shipped as a component of a transmitter or as a spare part, must be replaced because of the discussed deficiencies. To aid in locating all of these amplifiers at your facility we advise you that transmitters shipped between January 1, 1988 and September 1, 1989 may contain the affected amplifier. In addition, please be certain to check your spare amplifiers for these date codes. The amplifier date code is on the back of the mounting side of the amplifier on a label which states plant of manufacture, and the year and the week of manufacture.

Example: 2B8812 i.e.

2B - Plant of Manufacture

88 - Year of Manufacture

12 - Week of Year Manufactured

See attached Exhibit A, Figure 3 for location of the date code.

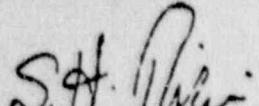

The number below the date code is an amplifier serial number.

Amplifiers must be replaced and will not be repaired by Foxboro. The 1988 to 1989 time frame has been identified through return failure analysis and stock inspections as the only period wherein the subject amplifier Part Number B0142EC has the identified deficiencies. Analysis and testing determined that the deficiency was not caused by the components but by workmanship deficiencies.

Also attached to this notification is a synopsis of test results intended to provide the user with some degree of possible transmitter output responses. See Exhibit B

B0142EC 10-50mA output amplifiers date coded pre 2B8801 (pre-Jan. 88, Wk 01) are NOT affected and 4-20mA output amplifiers are NOT affected.

Please notify the Foxboro Company, Ms. Eileen Morris (1-508-549-4137) as to the number of needed replacement amplifiers. Certificates of Conformance will be provided with either individual or group amplifier replacements referencing part number, model and serial number of the complete transmitter where applicable. For technical questions regarding these deficiencies, please contact Mr. Jack Sears (1-508-549-2191) or Mr. James Keiper (1-508-549-6332).

EXHIBIT B

Not all combinations of deficient lead combinations and arcing can be duplicated to determine transmitter output oscillatory response. Analysis of field returns and stocked amplifiers has found the loose cathode lead to be the most prevalent defect therefore causing arcing and oscillatory response. The following are the results of tests to determine and predict the type of response if different at various transmitter output levels with an arcing or disconnected zener cathode lead:

a. Transmitter Output @ 0% (10mA)

Oscillation of Approximately 20% P-P
Oscillation Frequency 12 to 17 Hz
Output Offset -2 to -5%

b. Transmitter Output @ 50% (30mA)

Oscillation of Approximately 40% P-P
Oscillation Frequency 17 to 20 Hz
Output Offset -25%

c. Transmitter Output @ 55% (32mA)

Initial output offset -50% within 25ms and approx. 9 cycles or less of oscillatory response in decrements back to within approximately $\pm 5\%$ of the initial output. No further oscillatory responses as long as arcing or noncontact exists.

d. Transmitter Output @ 75% (40mA) and above

Initial Output Offset -50% within 25ms and approximately 3 cycles or less of oscillatory response in decrements back to within approximately -12% or less of the initial output. No further oscillatory responses as long as arcing or noncontact exists.

Examples of these output responses are available to aid visually the above descriptions.

CONCLUSIONS

All responses to the arcing zener diode cathode lead or loss of lead contact causes initial output decrease or offsets and the magnitude varies with transmitter output.

Below 55% of transmitter output, responses are sustained oscillations with differing peak to peak amplitudes and the magnitude of output offset also decreasing with lower transmitter outputs.

Above 60% of the output, responses are decremental, no sustained oscillatory result and returning of the output to a negative output offset. Decremental recovery occurs in fewer cycles as the output of occurrence approaches 100%.
