Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:24:34 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Sherry Dinnen

GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Susan P. Walp

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. Duh. Radioactive. Are you stupid or just pscypaths for money. Duh. Protect us!

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Ilana Krug
Idlewylde, MD 21239

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:24:22 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
L. Zeveloff
Ogden, UT 84403

A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Jean King
Livermore, CA 94550

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:24:17 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Jan McCreary
Silver City, NM 88062

Dear Nuclear Regulatory Commission rulemaking,

I STRONGLY OPPOSE the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, ONLY DEEP GEOLOGICAL DISPOSAL will ENSURE that this WASTE is NOT a THREAT TO HUMANITY. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists SITE IN Andrews County, TEXAS. A STUDY BY the TEXAS Commission on ENVIRONMENTAL QUALITY showed that THIS SITE is NOT GOOD for disposal of radioactive waste BECAUSE of RISK of WATER CONTAMINATION. This RULE CHANGE seems DESIGNED TO ALLOW INADEQUATE DISPOSAL OF this WASTE THROUGH SHALLOW BURIAL.

I urge you NOT to PROCEED WITH THIS RULE making AND to DEVELOP a SAFE SOLUTION FOR the HANDLING AND DISPOSAL OF Greater-than-Class C WASTE.

Thank you for your consideration.

Sincerely,
Gay Nelson
Lincoln, NE 68528

A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Sincerely,
Danny Dyche
Hillsboro, OR 97123

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:24:12 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Mike Acosta
Riverside, CA 92504

The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Beverly Hoff
Pflugerville, TX 78660

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:24:07 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:24:04 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Susan Picard

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
carissa fairchild

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:24:01 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. I write as a mother and grandmother who is very concerned about succeeding generations' safety.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial. Do not allow this dangerous practice!

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial. Just - NO.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I strongly urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Date: Thursday, November 07, 2019 3:23:57 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Debra Nix

For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Lora Stakey
Sebastian, FL 32958

Date: Thursday, November 07, 2019 3:23:55 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:23:53 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration. God Bless America.

Sincerely,
Jordan Polycranos
Gaithersburg, MD 20878

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. It would seem on its face that our government would understand that the utmost care needs to be used in the disposal of such waste. Not doing so is criminally negligent.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Dianne Harrison

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 4:19:05 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Ray Kalinski
Saint Cloud, FL 34770

This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Nina Tatlock

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 4:18:44 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Suzanne Becket

This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Richard Tregidgo

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 4:18:10 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Susan Beever
Seabrook, TX 77586

This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years), and other types of nuclear waste. For this reason only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Janet Thomas

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:58:12 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Kenneth Hannon

GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Maxine Goodyear
Independence, IA 50644

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:35:29 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Lynn Biddle

For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
nancy hartman

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:32:14 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:28:27 PM

Dear Nuclear Regulatory Commission rulemaking,

I STRONGLY oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also hugely concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I strongly urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Catherine Hamel

GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Sheila Spencer

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:24:35 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Sibylle Schwarz

GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Christian Camphire
Bradenton, FL 34208

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 5:44:03 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Ruth Swenson

GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
jean rodriguez

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 4:55:31 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Steve Rosin
Pasadena, CA 91101

GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Lorraine Akiba
Honolulu, HI 96808

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 4:48:42 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Stephen Blocklin

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Bo Bergstrom
Silver City, NM 88061

This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Paul Cohen

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 4:38:52 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Charles Phillips

A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Vernon Batty
Pagosa Springs, CO 81147

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 4:27:18 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

If there were any incident because of this rule change it could derail nuclear power forever. Small scale nuclear power may be our best hope for making the transition away from fossil fuels in time to avert the most catastrophic effects of climate change and it is already going to be a very hard sell. An accident with nuclear waste would be devastating to this possibility.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Tania Smith

This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Linda Quinet

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 4:20:30 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

The last thing anybody wants is a radioactive Love Canal.

Thank you for your consideration.

Sincerely,
Peter Rogan
Royal Oak, MI 48073

A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
EDWARD BRUNER
Winter Garden, FL 34778

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 6:43:39 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Jim Loveland
Gulfport, FL 33707

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Anna Klene

Date: Thursday, November 07, 2019 6:26:52 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 6:19:34 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste. I am a proponent of *safe* nuclear energy.

Thank you for your consideration.

Sincerely,
Curtis Schroeder

For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Janet Bartos
Little Rock, AR 72223

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 6:10:37 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 6:03:59 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Linda Peterson

For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Marianne Arcuni
Dumfries, VA 22025

Date: Thursday, November 07, 2019 5:58:03 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 5:51:39 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
June Davenport

For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
K.G.H. NICHOLLES

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 5:46:17 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Dave Taylor

For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Rich Moser
Santa Barbara, CA 93111

Date: Thursday, November 07, 2019 5:45:55 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 5:45:26 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
M. Langelan

For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Solo Greene

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 5:44:49 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Helen McCone
