UNITED STATES OF AMERICA
NUCLEAR REGULATORY COMMISSION
PUBLIC MEETING
ADVISORY COMMITTEE ON REACTOR SAFEGUARDS
SUBCOMMITTEE ON SAFEGUARDS AND SECURITY
- - -

Nuclear Regulatory Commission
Room 1167
1717 H Street, N.W.
Washington, D.C.

Thursday, June 26, 1980

The Subcommittee met, pursuant to notice, at 8:35 a.m.

BEFORE:

- MR. J. CARSON MARK, Presiding
- DR. CHESTER P. SIESS
- DR. STEPHEN LAWROSKI
- DR. DADE W. MOELLER
- MR. MICHAEL BENDER

ALSO PRESENT:

- MR. RICHARD K. MAJOR

P R O C E E D I N G S

1
2 CHAIRMAN MARK: The meeting will come to order.
3 This is an open meeting of the Advisory Committee
4 on Reactor Safeguards, the Subcommittee for Safeguards and
5 Security.

6 I am Carson Mark, the Subcommittee chairman.
7 Other ACRS members present today are Dade Moeller, Steve
8 Lawroski, Chester Siess, and possibly Mike Bender will
9 manage to come in a little late.

10 The purpose of the meeting will be to review the
11 FY 82 budget of the Safeguards Fuel Cycle and Environmental
12 Research Division in the area of safeguards in preparation
13 for the ACRS annual reports to the Commission and to
14 Congress.

15 In addition, the Subcommittee will be briefed on
16 recently completed studies relating to reactor plant design
17 to reduce vulnerability to sabotage, and code development
18 related to spent fuel storage pool consequence estimates
19 from sabotage.

20 This meeting is being conducted in accordance with
21 the provisions of the Federal Advisory Committee Act and the
22 Sunshine Act. It may be necessary for the Subcommittee to
23 hold one or more closed sessions for the purpose of
24 exploring matters involving proprietary information and
25 possibly some matters involving undisclosed budgets.

1 Mr. Richard Major on my right is the designated
2 Federal employee for this meeting.

3 The rules for participation have been announced as
4 part of the notice of this meeting previously published in
5 the Federal Register on June 11, 1980. A transcript of the
6 meeting is being kept, and it is requested that each speaker
7 first identify himself or herself and speak with sufficient
8 clarity and volume that he or she can be readily heard.

9 We have received no written statements or requests
10 for time to make oral statements from any members of the
11 public.

12 Do any members of the ACRS who are present have
13 comments to make?

14 (There was no response.)

15 You have the agenda. It may be useful to make
16 some shift in that agenda. The discussion of the nuclear
17 fuel cycle adversary consequences will probably require to
18 be closed, which suggests that it perhaps be taken towards
19 the end of the morning session where it could be put
20 together with those comments on the budget, which would best
21 be in closed session, that is, the budget numbers, not the
22 research plans. That would amount to shuffling of one of
23 the items.

24 In addition, Dr. Heinrich from Savannah River, I
25 believe, will not be here; and Frank Dean from Sandia, who

1 has been involved in the study, while perhaps not as a
2 special topic, will at least introduce it into the
3 discussion of the Sandia work.

4 That is all that I have in mind in connection with
5 the agenda, with the exception that we have Carl Michaelson,
6 a former consultant to the Subcommittee here, and although
7 it is not tagged on the program, we hope to discuss at least
8 with the research people or NMSS people the questions of
9 their current view of the problem that Michaelson raised
10 with this subcommittee at its last meeting, plans they may
11 have for addressing that view.

12 That may perhaps best fit in the discussion
13 connected with the power plant design concepts for sabotage
14 protection. What I just mentioned might perhaps not be
15 improper in an open meeting. If we got to some detail of
16 that, it, too, might have to come back with the part for
17 which we would have to close the meeting. Anything, I guess,
18 which relates to a specific way of doing some damage would
19 best be handled that way.

20 Unless some of the other subcommittee members have
21 inquiries, we will now proceed with the meeting. I call
22 upon Mr. Arsenault of SAFER to open the meeting, outlining
23 the RES or the NRC staff's plan.

24 MR. BASSETT: I am Sam Bassett, his deputy, and
25 Frank has asked me to operate in this area of the meeting.

1 We have with us Jay Durst, who is our A.D. for safeguards
2 and fuel cycle safety, and Jerry Tomlin, who is the branch
3 chief of our safeguards activity.

4 Jerry will conduct the normal course of the
5 meeting and will introduce the various speakers. He is
6 scheduled to follow Messrs. Varnado and Ericson, and I think
7 we should just go right ahead with that meeting unless there
8 is something that you would like to say.

9 DR. LAWROSKI: Could I ask a question? Some time
10 ago, I think shortly after we heard from Mr. Michaelson
11 about some of the scenarios, the NMSS people were going to
12 address the question of the consequences of some of those
13 scenarios to be analyzed. Did that ever get done?

14 SPEAKER: There will be a representative from NMSS
15 here later in the day.

16 DR. LAWROSKI: All right, I will wait.

17 MR. BASSETT: Why don't you go ahead.

18 MR. TOMLIN: I'm Jerry Tomlin, the Branch Chief of
19 the Safeguards Research Branch. I would like to introduce
20 Dave Ericson.

21 MR. ERICSON: I'm Dave Ericson from Sandia Labs.
22 We would like to take a few moments and highlight some of
23 the high points of this study. I think the Committee was
24 provided copies of it fairly recently. We will comment on
25 some of the key points and then attempt to address any

1 questions you may have.

2 The study was a design to look at potential value
3 of plant design and damage control measures for enhancing
4 protection. I should underline also that this study was
5 intended to look at future plants. It was not a retrofit
6 design, but rather what about new design, and then in turn
7 to look at the impact of such measures on plant costs.

8 The background, of course, is that Sandia has been
9 involved with the reactor safeguard and sabotage question
10 since the early part of the seventies. The Committee itself
11 had raised some questions in that time frame. Subsequent to
12 the original Sandia studies, an industry workshop was
13 convened in which a number of people from industry were
14 cleared and invited to comment on those original Sandia
15 studies.

16 Out of that workshop came recommendations for
17 additional research, and then in mid calendar 1977, the
18 Office of Reactor Regulations issued a user request to ask
19 that this question be examined.

20 In looking at the question of sabotage resistance
21 and, indeed, resistance to all problems, a number of design
22 objectives were suggested. We have entitled this "Design
23 Objectives for Risk Reduction," but I will stress and make
24 clear that we are only looking at this from the sabotage or
25 the malevolent act viewpoint, not all aspects of risk

1 reduction.

2 A number of ways one might do this would be to
3 simply reduce the number of ways in which the release could
4 be caused. You might do this by simply hardening the
5 equipment or making it less vulnerable into individual
6 pieces, or we might reduce the number of paths, the number
7 of points of entry that an adversary might have.

8 One might increase the number of individual
9 actions required to complete a sabotage sequence, physically
10 separate equipment, make it more remotely located, increase
11 the number of redundant functions, add to the number of
12 things that would have to be done. Of course, one might try
13 to reduce the probability of a success. Again, this could
14 be done by reducing the vulnerability of a particular piece
15 of equipment or making it more difficult to get at that
16 equipment. Both of these would work in that direction.

17 Finally, one might reduce the consequences. Given
18 that a sabotage sequence had been completed, we might look
19 at the ways that we could reduce the consequences of such
20 success. This would involve what we have chosen to call
21 damage control, or it could involve accident mitigations of
22 other types.

23 Now, having done this, of course, then the
24 question is, well, what are your evaluation criteria? Those
25 are the kinds of things you are looking at: what are the

1 criteria? The value measure then may be sort of abstracted
2 in this fashion. Certainly one value would be if you have
3 reduced the number of Type 1 vital areas.

4 That is, if you have reduced the number of areas
5 from which a release could be caused, you have gained
6 something. If you have reduced or eliminated targets which
7 were formerly unprotectable in some sense, that would be of
8 value. Certainly increasing the difficulty of movement for
9 an adversary would meet several of those design objectives.
10 Increasing the probability of sequence interruption or
11 increasing the likelihood that you could neutralize an
12 attacker would be of help.

13 Let me comment here that in our evaluation, we did
14 not look at the question of neutralization. In apply some
15 models that are available, we did not apply any engagement
16 between guard forces or law enforcement agencies and the
17 adversary. We stopped short of that point. And certainly if
18 the design can give you some control of the insider, that
19 would be helpful.

20 Obviously the impacts are straightforward in some
21 sense. Capital costs and operating costs are a very direct
22 measure of the impact of any system. The effect upon
23 safety, or security requirements interacting with or
24 conflicting with safety requirements. And then finally,
25 what is the effect on operations, either the maintainability

1 of the equipment, the ease of access to it for maintenance,
2 perhaps the operator attitude, the performance of those
3 people: is it affected by the security you impose?

4 Before I talk about the study itself, I would like
5 to mention the fact that, recognizing that we needed all the
6 expertise we could bring to bear, we have established what
7 we have chosen to call a Design Study Technical Support
8 Group. We have contacted the vendors, utilities and
9 architect-engineers and solicited their involvement,
10 solicited not on a volunteer basis but we actually put
11 several groups under contract.

12 The goal was to have these people assist us in
13 reviewing and evaluating the design options and the measures
14 that were developed during the program. They were not under
15 contract to develop these but rather to assist us in
16 reviewing and evaluating.

17 We also were using them as a way of getting
18 additional data and technical analysis in some instances,
19 and certainly from the utility viewpoint, to give us some
20 advice and some guidance on potential operational impacts.

21 The participants included all four vendors:
22 Combustion Engineering, Westinghouse, B&W and General
23 Electric; two architect-engineers, a gentleman from Bechtel
24 and one from Sargent & Lundy, both experienced people; and
25 then the four utilities.

1 From the utilities, from Duke we had a member of
2 the engineering staff; from Commonwealth and Northern States
3 we had two plant superintendents. I might add we must have
4 had good people because since the study began both of these
5 gentlemen have been promoted to corporate headquarters. We
6 also had a security man from Power Authority, State of New
7 York.

8 CHAIRMAN MARK: Excuse me. Promoted so that they
9 can't help you any more?

10 MR. ERICSON: No, sir. As a matter of fact, they
11 both have been so very helpful, and indeed, we have had
12 several meetings with this group, one just last week, and
13 they were still participating. So we haven't lost them even
14 though they have assumed additional responsibility.

15 The two firms at the top are listed a little bit
16 separately. International Energy Associates is a consulting
17 firm here in Washington who assisted us as a subcontractor
18 in laying some of these things out. Nuclear Projects, Inc.
19 is the executive agent between the utility combine and
20 Westinghouse and Bechtel in the construction of the SNUPPS
21 plant.

22 Their involvement and the reason for their
23 involvement will be immediately obvious when we talk about
24 the plant we chose as a baseline.

25 Since we were interested in future design, we

1 thought it was important to start with some current state of
2 the art of design. Looking around, there were a number of
3 potential systems that one might have chosen, the concepts
4 being advanced. We selected SNUPPS for a variety of
5 reasons. It was under construction. There were to be five
6 to six identical units, and not the least of all, yours
7 truly happened to know a few of the troops out there, so
8 that always opens the door a little easier.

9 We chose SNUPPS to provide us plant layouts,
10 structural ideas and this sort of thing, not to analyze
11 their plant but to provide a baseline. We then looked at
12 this, got the safety descriptions for the key safety
13 systems, then characterized the plant by doing a sabotage
14 fault tree analysis, which we will not discuss in this
15 meeting, using the techniques that have been involved at
16 Sandia to analyze the potential events, and then to convert
17 events which would lead to a release to a vital area
18 analysis, and then to do further analysis by laying out the
19 plant.

20 So we are all on common ground, let me just throw
21 a block diagram of this plant up. I'm sure most of you are
22 familiar with this. SNUPPS is a four-loop Westinghouse
23 plant laid on a peninsular arrangement with turbine hall to
24 my right, reactor building, fuel building in line. The
25 auxiliary building housing all the bulk of the ESF equipment

1 is immediately adjacent to the control building, and the
2 emergency diesel is then to the side of that.

3 I have colored in yellow some areas which house
4 safety and control equipment, which we will discuss further
5 as we talk about the alternatives and some of the things we
6 looked at regarding this plant.

7 Just as a way of comparing and showing you what
8 happens when we do the analysis, this is that same plant
9 after we have digitized it. This is a computer drawing of
10 the same plant. Now we are inside. We have included inside
11 detail.

12 These happen to be the RHR heat exchanger
13 compartments, containment penetration rooms. This happens
14 to be ESF switch gear rooms and the diesels if one looks
15 inside the plant, and this is the auxiliary feedwater area.
16 These two little dots are the tanks. This is condensate
17 storage and makeup.

18 The diamonds are potential areas of concern. When
19 we do the analysis, some of those disappear, but we prepared
20 these just simply based on the drawings, so we put lots of
21 things in to begin with.

22 In looking at design alternatives, then, we had a
23 number of goals in mind. One was that they ought to be
24 practical alternatives. They ought to be something one can
25 do. A variety of people have talked about these things in a

1 variety of ways through the years, so the question was have
2 we ever looked at them in a consistent fashion.

3 So one of our goals was to get it all down in the
4 same format so they could be compared on a relatively equal
5 basis. We selected the designs to be considered. I should
6 comment these were not unique with us. We picked on all the
7 brains and all the prior comments we could to establish the
8 list.

9 Functions are, of course, we have said, to
10 maintain primary coolant integrity in inventory, make sure
11 the reactor is tripped, and then to remove any shutdown or
12 decay heat.

13 As a result of all the investigations prior to and
14 including this one, four categories have been established as
15 to the kinds of designs one might use. You could harden
16 critical systems, that is, make them just inherently less
17 vulnerable. You could change the way the plant is laid out,
18 put things in different locations.

19 You might consider changing systems themselves,
20 actually the way a system is designed, or as always, you
21 might add something additional to the plant. Our goal was
22 to get to the point where we had them documented and
23 developed to the point conceptually where we could do some
24 evaluation of them.

25 The kinds of things that come out, and these are

1 only examples, not the full list that we looked at, are:
2 under hardening systems you might look at potential
3 hardening containment, additional protection or hardening of
4 the ultimate heat sinks. You might consider enclosing
5 makeup water tanks.

6 In layout one might consider additional separation
7 of the containment penetrations, routing any power cables to
8 outlying safety-related buildings underground, well
9 underground to protect them. You might lay out the control
10 room in a different fashion. You might even move some of
11 the emergency cooling system into containment.

12 Yes?

13 DR. SIESS: Just what do you mean by hardening?

14 MR. ERICSON: In the case of structures, more
15 concrete to make them less vulnerable. In this case --

16 DR. SIESS: To a forcible entry?

17 MR. ERICSON: To a forcible entry or forcible
18 attack.

19 DR. SIESS: Multiple doors, special doors, special
20 --

21 MR. ERICSON: In some cases eliminating doors.

22 DR. SIESS: You consider that hardening also?

23 MR. ERICSON: Yes, sir.

24 DR. SIESS: Making it more difficult to enter.

25 MR. ERICSON: That's right.

1 DR. SIESS: Either by forcible means or
2 surreptitiously.

3 MR. ERICSON: Yes, sir. Now, it turns out that
4 because of the concern about insider questions, hardening
5 may not always get you where you want to be. If you harden
6 the door and then give the man the key, you really haven't
7 bought much.

8 In terms of system design changes --

9 DR. SIESS: Two keys helps.

10 MR. ERICSON: Sir?

11 DR. SIESS: Two keys might help.

12 MR. ERICSON: Right.

13 In design changes, of course we might look at the
14 way some of the low pressure systems are isolated, alternate
15 ways of doing containment. One of the things that was
16 talked about was the ability to run back the turbines and
17 function without off-site power.

18 The independent safe shutdown could be added, or
19 additional -- one thing that was suggested one time was
20 additional scram systems.

21 All in all, in this initial list we had 29
22 different alternatives. Some half of those are listed here.

23 We have reviewed the list with our comments on
24 them, with our support group, on two separate occasions.
25 And I should point out that we did not ask for a consensus

1 from that group. We asked for their advice and their
2 counsel, and then we said we will stand up and be counted
3 and take the responsibility for the decisions. Tell us what
4 you think, and we will go from there.

5 We did not ask them to vote and give us a majority
6 position or anything like that.

7 We looked at six alternatives. One was hardening
8 of makeup water tanks, which would be a way of hardening,
9 putting some protection around them, and that falls in that
10 first category. The second two, separating penetrations or
11 separating redundant trains even further, is plant layout.
12 Hardening the decay heat removal system would be in the
13 fourth category, and the last two would be some system
14 design changes, looking at the low pressure, and also what
15 one might do a facility to facilitate damage control, to
16 facilitate going in and doing some repair.

17

1 We took these alternatives, developed them to the
2 conceptual design state. Then combined them with a physical
3 security system which we believe is consistent with the require-
4 ments of 73-55; and came up with three alternative plant
5 configurations.

6 I should point out that the goal was to keep the physi-
7 cal protection system, that is, the guards, detectors, that sort
8 of thing, as constant as possible from alternative to another.
9 So, changing the way you did the security system didn't unduly
10 influence the results.

11 I also will say that we did not bring our security
12 plan to the staff and say, "Is this acceptable in today's age?"
13 Based on our own interactions with the staff, we believe they
14 were consistent with the existing requirements.

15 CHAIRMAN MARK: You mentioned damage control. Damages,
16 for one thing release to the environs of radioactive material;
17 for another, it's put in a plant in a state where it's expensive
18 to clean up or repair.

19 Are those separable? Do you put more weight on one
20 than the other?

21 MR. ERICSON: We have attempted to look at damage
22 control, or we're looking at it from the standpoint of what
23 could you do -- if he has damaged certain pieces of the gear,
24 what could you do to get those back on the line to prevent the
25 release, the ultimate releast to the public?

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 CHAIRMAN MARK: So, it's the release that is over-
2 riding?

3 MR. ERICSON: That's our concern, yes. That's the
4 thing we want to avoid. Anything we can do up until the time
5 that that happens, we'll consider damage control.

6 Now, I recognize that damage control immediately
7 evokes various ideas in people's mind. We will talk about some
8 of that.

9 CHAIRMAN MARK: Well, with TMI sitting there, damage
10 control means something different.

11 MR. ERICSON: Right.

12 DR. LAWROSKI: What was the relative emphasis of the
13 insider versus the intruder being the one that arranges the
14 sabotage?

15 MR. ERICSON: We tried to look at both as equally as
16 we could. Now, admittedly, as we will talk about it, we get
17 into -- one can be done with some neat little models, the other
18 requires a lot of judgment at this point in time. I will discuss
19 that.

20 First, with simply the hardening make-up water tanks,
21 we looked at three ways to do this. You can put a building
22 around every tank, you can put several tanks in a building, you
23 could put in the ultimate and move buildings into the tanks
24 inside existing buildings.

25 The second one, which appears on the next figure is

bfm3

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 the most radical departure from the current designs now being
2 considered. That is completely separating the redundant train.
3 Now, rather than having your redundant equipment in adjacent
4 compartments in the auxiliary building, we have separated the
5 redundant trains into two completely separate bulidings, A and
6 B, with emergency diesel with each train associated with it.

7 In doing this, we wind up adding some equipment. We
8 added an additional turbine driven auxiliary feedwater pump. We
9 added some high pressure injection pumps. So that the normal
10 operating equipment charging this sort of thing now all appears
11 in the auxiliary building as does the controls.

12 DR. SIESS: Hasn't somebody done that? Isn't there
13 a design -- is that the German design, that has essentially
14 three buildings -- German has four buildings, hasn't it?

15 MR. ERICSON: That's correct. Some of the Swedish
16 designs are very similar to that. So, again, we have said --
17 nothing uniquely created out of thin air, we borrowed from where-
18 ever we could.

19 This design, by adding the high pressure injection
20 and taking charging as a normal charging system away, then
21 completely separate safety and charging. The other criteria was
22 that there be no direct access from this safety train to this
23 safety train. In other words, there is no door from building A
24 to building B.

25 The entrance to both is through the auxiliary building

bfm4

1 through well protected doors. To get to building A, you actually
2 go through a tunnel.

3 The other alternative that we'll comment on was adding
4 -- we have chosen simply to do this in a separate building --
5 that's the way to do it. If you were designing a new plant,
6 you might even have the alternate decay heat removal system,
7 or shutdown heat removal system located within the building
8 contiguous but separate from --

9 DR. LAWROSKI: How much is in that rectangle?

10 MR. ERICSON: We have in there a -- this really pro-
11 vides essentially additional transit protection. We have
12 sufficient borated water and charging pumps to make up seal
13 leak -- seal losses, that kind of normal -- that kind of losses
14 and auxiliary feedwater.

15 DR. SIESS: What about power?

16 MR. ERICSON: It is completely self-contained. We
17 sized it at about 1700 kilowatt on the diesel, which would
18 provide the auxiliary feed and any other power needed to run
19 this system.

20 DR. SIESS: Similar to the German system?

21 MR. ERICSON: Yes.

22 DR. LAWROSKI: Well, I don't know. How large of a
23 thing?

24 MR. ERICSON: That is a very strong seismic one,
25 thick walled, vaulted door ability in this particular model.

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

bfm5

1 It is very similar to the Germans.

2 Given those designs, what did it buy us? In looking
3 at the value, which is safeguards effectiveness, or increased
4 resistance, what external threat we have the Sandia developed
5 semi-automated facility evaluation techniques which lead to those
6 digital plots, the vital are analysis. In the long run, you
7 also are applying some judgment.

8 The internal threat, there are a number of models being
9 pursued now. There have been some developed for other aspects of
10 the fuel cycle. There are now some studies looking at applying
11 those to power plants. We did not use those in this study, rather
12 looked at the question and tried to do it from a relatively
13 subjective way.

14 The impacts we have mentioned before, cost, manpower,
15 operations to meet safety. The cost -- strictly from cost
16 estimates based on the conceptual design, manpower and constraints
17 will, of course, be the result of analysis, looking at what you
18 are adding and where it is.

19 Now, we -- in doing this, if one looks at the question:
20 Can you reduce or eliminate vital areas, vital plant areas? In
21 the base-line, as we have analyzed it, there is potentially
22 five. Two of those involve the spent fuel pool in the cask
23 area, the other three are plant areas. One of those, it depends
24 on what kind of capabilities are ascribed to the shutdown panel,
25 whether or not that becomes one; and 37 other areas, as we have

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 analyzed the base-line plant.

2 DR. SIESS: What's the 1 and 2, again?

bfm6 3 MR. ERICSON: Type 1 vital area, which would be the
4 single location. Type 2, which you would have to visit two or
5 more locations to cause a release.

6 Those 42 total plant locations can be put together in
7 56 different combinations to cause you a problem. Obviously,
8 if all you have done is harden the outside enclosure, you
9 haven't changed whether or not it was an area. So, that stays
10 the same.

11 In physically separating the buildings, we definitely
12 lose one out of our potential and the safe shutdown -- the
13 alternate shutdown panels are no longer type ones, for sure. We
14 added a couple of type two areas. You also see that now there
15 are many more ways in which those 43 areas may be strung together.

16 DR. SIESS: That could be, or would have to be?

17 MR. ERICSON: Could be. Any one of the 291 combina-
18 tions could cause you a problem. However, it turns out if you
19 look at the converse of that, how many areas must I protect to
20 make very sure they can't cause me a problem? That one reduces
21 it to about three areas, the type one vital areas and one of
22 the safety buildings, and you've done the job.

23 A lot of those combinations or sequences involve
24 double compartments. That is, you have to get into both A and
25 B safety trains. So, if I can absolutely keep him out of one

1 safety building, then he cannot cause any of the sequences.

2 DR. LAWROSKI: Causing a problem in this case means
3 release?

4 MR. ERICSON: Release, yes.

5 CHAIRMAN MARK: I have a feeling that the last way you
6 stated it was surely basically the important way.

7 DR. SIESS: The first way you stated it, the higher
8 the number in that last column, the more difficult it is to detect.
9 Yet, you turned it around and make it look the other way.

10 MR. ERICSON: Let me put the numbers up here. It
11 turns out in the first -- for the base-line plant, there are
12 approximately 17 areas that must be protected. By area, this
13 may be as small as a compartment that's ten feet square.

14 In the physically separated and protected building,
15 you have fewer, because a lot of those pumps are in a single
16 building that is very massive and has a single point of entry.
17 That's -- for the outsider, that's a very potential gain. For
18 an insider, it may or may not be.

19 CHAIRMAN MARK: I guess it's fair to say that you have
20 fewer areas which -- had better be protected better.

21 MR. ERICSON: That's right. In all the things that
22 we have looked at, we did not make significant changes in things
23 like control room. The spent fuel area will frequently show up,
24 however, the cask is a time window thing. It may be there and
25 it may not, if you are looking at --

bim7

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 DR. SIESS: It's still difficult for me to see a big
2 difference between the 56 and 292 in the last column. I wonder
3 if you can just give me an example of the kind of combination
4 that is added when you go to the physically separated and protected
5 systems that gives you back to six.

6 MR. VARNADO: I can add --

7 MR. ERICSON: I was going to say, I was going to try
8 to make it simpler.

9 DR. SIESS: It can be simple, we have time.

10 (Laughter.)

11 MR. VARNADO: In the physically separated design, we
12 have added some additional compartmentalization as well. So that
13 when you combine -- you now have the safety trains with somewhat
14 greater degree of compartmentalization.

15 If I interrupt that train anywhere near, you know, in
16 its course, then I have accomplished my goal. Now, I have the
17 same thing in two different buildings, so it's like a product of
18 those numbers that gives me the number of combinations --

19 DR. SIESS: In other words, in one building there are
20 six places where I could sabotage it? In this, you got the six
21 places separated?

22 MR. VARNADO: That's right.

23 DR. SIESS: It really doesn't complicate the saboteur's
24 job that much.

25 MR. VARNADO: Well it does in the sense that he has two

1 totally separate places to go. He has to get into two separate
2 buildings.

3 DR. SIESS: He had to do that in base-line, didn't he?

4 MR. ERICSON: No, only had to get in into two separate
5 compartments, which may be adjacent to one another.

6 For example, the BSF pumps in the design are compart-
7 mentalized. They meet all their safety and fire protection
8 criteria, but they're in a row down a corridor with doors on each
9 one. So, he just goes from one to the next.

10 Here, he has to go out of the building to get into
11 another one.

12 DR. SIESS: I don't think the last column is that
13 significant.

14 MR. ERICSON: Let's look at -- I've added the question
15 of how many you must protect.

16 CHAIRMAN MARK: It is for computer time.

17 (Laughter.)

18 MR. ERICSON: It would take him longer to figure it
19 out. In the complement set, or the areas that must be protected,
20 you see it looks like the same, but it turns out that eleven of
21 these then can be in a single building, a single safety train,
22 either the A or B buildings.

23 So, if you put your protection boundary at that massive
24 boundary, then you are looking at three areas; two type ones and
25 a collection of type two areas that would really have to be

1 protected.

2 DR. SIESS: But the last one does almost as well,
3 doesn't it?

4 MR. ERICSON: Yes, for the transient events, because
5 now you have added additional redundancy for transient events.
6 You can still -- in this last one, in order to be functional, of
7 course though, you must have an intact primary system to be able
8 to supply -- take heat out thorough the steam generators.

9 DR. SIESS: In looking at the third and fourth ones,
10 the fourth one is possible for the existing plant, the third one
11 is not.

12 MR. ERICSON: Absolutely. The third one -- that's --
13 you're starting from scratch. You can't go back. Let's change
14 it a little.

15 The base-line plant, as we said, is a very compart-
16 mentalized design in accordance with the best existing practice.
17 However, there are multiple ways that you can get to some of
18 those points. For example, as I said, the pump rooms are located
19 off a common corridor which you can get at in a variety of ways.

20 An operator, in essence, has access to both trains at
21 the same time in that if he's on his rounds, and he's going down
22 the hall.

23 If one wanted to say, "Let's look at the insider and
24 we'll control him," by administrative controls or work rules.
25 To keep the train separate, you have to do this in very small

1 compartmental levels.

2 In the physically separated case, you now have them in
3 separate buildings with single access, even though you've
4 compartmentalized within the train.

5 They way we have laid it out in this particular concept,
6 the access routes are well-defined. There is one door for
7 normal access. There are emergency escape routes, but they are
8 one-way routes.

9 We separated all emergency and operating equipment.
10 The operator then would only have access to one train at a time.
11 He would have to come back through A building before he could
12 go over to B building, which might be an opportunity for doing
13 some verification of equipment status.

14 Then, administrative controls, if you were really
15 considering work rules or that sort of thing, you could do it
16 on two buildings rather than on the whole complex.

17 Adding the system, adding the base -- taking the
18 base-line or something similar to it and adding the shutdown heat
19 removal system, again, compartmentalization is the same as the
20 base-line plant. You have added the redundancy. That compart-
21 ment, as we have laid it out here, certainly has well-defined
22 routes. You can build it as a bunker and put a single door or
23 two doors on it, so there is the only way in. Then one could
24 put administrative controls -- heavy controls on the one building,
25 less -- perhaps less severe controls inside.

bfml2

1 DR. SIESS: So having a well-defined route, from this
2 point of view, is totally advantageous. It means you have only
3 to watch that route.

4 MR. ERICSON: That's right.

5 DR. SIESS: Or is it, for an outsider, having a well-
6 defined route seems to have an opposite connotation?

7 MR. ERICSON: It could. On the other hand, for the
8 outsider, if you have walls ten feet thick, you can assume that
9 he's not going to try to come through there. He can try to come
10 through doors.

11 If you know that's where he's going to come, you can
12 increase the detection surveillance.

13 DR. SIESS: It's good in all circumstances to have a
14 well-defined and limited scope route.

15 MR. ERICSON: Yes. It could help you in both cases.

16 DR. SIESS: All right.

17 MR. ERICSON: Thirdly, if you are looking at control
18 of insider movement, well-defined routes would be helpful; of
19 not coming through the gate and wandering everywhere.

20 Of course, nothing is without its cost. We have not,
21 at this point we do not have a complete cost data on the base-
22 line plant. We assumed that if -- for point of argument, if
23 \$3/4 billion in '78 dollars is probably more than that now for
24 those base-line plants.

25 We looked at the SARs and said, "Well, it's going to

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 take approximately 60 operators and technicians."

2 We recognize that plants today have far more men than
3 that on site in a given shift; probably will have in the immediate
4 future. Certainly, these things are kept, the operation safety,
5 maintenance safety, are as far as we know meeting the criteria.

6 Adding enclosures, in terms of '78 dollars, we estima-
7 ted would cost another half to a million and a half dollars. It
8 doesn't change your way of doing business at the plant, particu-
9 larly. It would increase the protection in that package.

10 In discussion this with the industry people last week,
11 even in terms of 1978 dollars, they said we were probably at
12 least 30 to 50 percent low on that estimate. Since we're compa-
13 ring all the same, we'll accept that we may be off in absolute
14 value.

15 In looking at the cost of separating the building,
16 in order to do this, because we didn't have the detailed cost
17 for the existing or the base-line idea, we had the same cost
18 estimator estimate the cost for the auxiliary building, the
19 control building, and the diesel building for the existing
20 facility the same way he did for the new facilities.

21 In other words, there would be a reasonable cost
22 comparison. Doing that, we wound up with about a \$16 million
23 increase; some possible increase in manpower; the rounds will
24 take longer, is simply takes longer to get around that more
25 spread out plant.

1 Maintenance may be a little more difficult because of
2 restricted access. Equipment movement would certainly would
3 be a little more of a problem than it is at the existing plants.
4 The additional high pressure system reduces reliance on operating
5 systems.

6 I think many of the utility people would just love to
7 debate this and say, "Well, if it's operating every day, it's
8 probably more reliable than the one that's sitting in the corner."

9 So, that trade-off is always possible here. Separate
10 shutdown panels, of course, does have an impact on control
11 life.

12 DR. SIESS: You're talking about the HPI separate pumps
13 rather than using the charging pumps?

14 MR. ERICSON: The charging pumps. The possibility of
15 separate shutdown valves or multiple shutdown panels of course
16 gets you back then. We have not looked at the details of the
17 control logic and things that have to be considered there.

18 From the personnel standpoint, you have two major plan
19 areas that you might impose some rather strict controls. Such
20 controls, we're continually told, will have no impact on the way
21 people think and the way they conduct the day to day activities.

22 Adding a shutdown heat removal system, we estimated at
23 about \$9 million. That's 50 percent low. You're looking at \$13
24 million, perhaps.

25 Again, you're adding equipment for the possible need

1 for increased people. This certainly will be additional surveil-
2 lance test, additional maintenance will have to be done, you have
3 another diesel that will have to be periodically operated.

4 You do have the additional redundancy available for
5 transients. We believe that you then could wind up with one
6 are of fairly strict access and control. Perhaps, then, that
7 would give you less adverse people reactions to controlling
8 activities.

9 DR. SIESS: Can you get by with a non-redundant diesel
10 and decay heat removal system?

11 MR. ERICSON: We have not said this -- we still have
12 all the existing safety. This is a third level redundancy. At
13 this point, we are not calling this a safety point. This is
14 a last-ditch bail-yourself-out sort of thing.

15 DR. SIESS: If that diesel is its only power supply
16 that came in to connect with other diesels with offsite power,
17 I could see the staff saying, "Single failure criterion."

18 MR. VARNADO: I guess we felt, for our design purposes,
19 sections of design criteria, we didn't feel that it was necessary
20 to apply the single failure criteria to this ultimate back-up
21 system.

22 MR. ERICSON: If you get to this point, you have
23 exhausted a lot of other possibilities, before you even turn to
24 this.

25 DR. SIESS: That is true; but if that's true, then

1 this damn well better work. Diesel reliability has not been
2 notably high.

3 I think the Germans have two diesels. Steve, do you
4 remember?

5 DR. LAWROSKI: I am not sure.

6 DR. SIESS: I'm not sure either. But that's not a
7 big deal.

8 CHAIRMAN MARK: You have mentioned ways in the last two
9 or three vu-graphs in which you might have to add people
10 because they have to walk further or have a few pieces of extra
11 equipment to check on.

12 If we think of the normal concer about a plant, its
13 safety because of breakdown, because of something or other, that
14 I would judge not really effective by your first three alternatives,
15 but is by this last one; namely, that there there is a feeling
16 you ought to add something, that's possible or is it not, that
17 this hardened decay heat removal system would meet some otherwise
18 normal need other than sabotage?

19 MR. ERICSON: As a matter of fact, we have concluded
20 that though this looks promising, it ought to be cc.sidered what
21 we are looking -- the staff is looking. Sandia is doing some
22 studies on the total question of shutdown -- ultimate shutdown
23 in decay shutdown heat removal by assessing a variety of tech-
24 niques for doing this.

25 We said beyond what is now existing, we said that this

1 ought to be included in that. For sabotage it shows some
2 promise, but that is not the only thing that has --

3 DR. SIESS: Fire protection. Let's see, at Ocone,
4 they have gone to a shutdown heat removal system for at least
5 two reasons that I recall: fire protection and sabotage.

6 I think they decided they could not meet either the
7 fire protection or the sabotage criteria with the existing --

8 They were consulted on this basis.

9 CHAIRMAN MARK: Am I right that the other changes you
10 discussed scarcely bear on the kinds of considerations which --

11 MR. ERICSON: Except for the completely separated
12 systems, fire protection could be enhanced.

13 CHAIRMAN MARK: The two building proposal does some
14 of that?

15 DR. SIESS: Fort St. Vrain has a partial isolated
16 decay heat removal system that they put in chiefly for fire
17 protection.

18 MR. ERICSON: Well, of course, there is always a bottom
19 line, which is what do you think you learned? A number of
20 conclusions that we have drawn at this point: design changes alone
21 do not appear to provide significant additional protection. By
22 that, I mean just simply changing the way you lay out a plant
23 in itself does not materially enhance the protection.

24 The way we did this for the outside, as I indicated
25 earlier, we did not attempt to model any engagement tactics, this

1 sort of thing.

2 We simply looked at it from the standpoint: Can I get
3 to an outside intruder before he gets through the last door?

4 Therefore, does changing the way I designed and built
5 the plant increase that probability? An insider, of course,
6 it depends on the kinds of access to the outsider.

7 However, the second point really addresses the point
8 that Dr. Mark raised a minute ago; that design changes, for
9 example -- if you've laid it out so that you have well-defined
10 routes that might facilitate the way you do your physical
11 protection, you could concentrate detectors, you could concen-
12 trate surveillance, maybe even provide dedicated response, a
13 variety of ways you might you might do this.

14 For the PWRs, the hardened decay heat removal systems
15 appear promising, but we'll say more about that under the
16 recommendation.

17 Through this I stress the design aspects and not so
18 much the damage control. We started out looking at the question
19 of advantage control from the more or less classical running
20 repair idea. Somethings been damaged, go fix it, get it back on
21 line or jerryrig it.

22 In some cases, that could be done. You are also
23 fighting a severe time restraint. You have things on backshift,
24 you have trouble getting people there, that sort of thing.

25 When we talked with our industry colleagues about this,

1 they said, "Hey, have you really looked at what we can do with
2 what's already there? The systems are installed. There are
3 alternate ways to use them."

4 We have looked at that to some extent. We have some
5 ideas which we think need to be explored further. Certainly, as
6 you look at alternate ways of using installed systems, you are
7 not only then looking at potential for encountering sabotage,
8 certainly now one has a potential for looking at accident
9 situations, doing things differently.

10 For example, it might be possible with relatively
11 simple design changes to provide a capability of bringing fire
12 protection water in to the auxiliary feed system. It has been
13 done, I think.

14 DR. LAWROSKI: What makes that third one not of those
15 under one? It's a structural design change.

16 MR. ERICSON: Well, it's more than a structural design.
17 I have added a system, too. In one, I have done nothing but
18 change the way I lay them out. I haven't added anything to it.

19 DR. LAWROSKI: Then it should say layout. Don't say
20 it is a design.

21 MR. ERICSON: We have wrestled with the right way to
22 say this repeatedly.

23 DR. LAWROSKI: Well, that first one tends to weigh a
24 very negative feeling. Unless somebody formally excludes the
25 third, you could easily have included that one under that.

1 MR. VARNADO: We do include that one under that.

2 DR. LAWROSKI: Under the first one?

3 MR. VARNADO: That's right. The third one goes with
4 the previous two, Steve. If the separate decay heat removal
5 system does provide a means of additional physical protection
6 measures which can increase the overall protection of the plant.

7 Just adding the hardened decay heat removal system
8 without additional controls, access controls and physical
9 protection measures, really is not going to buy you a great
10 deal.

11 DR. SIESS: I thought by structural, you meant walls
12 and doors and not pumps, valves, and pipes.

13 MR. ERICSON: That's correct. There are some sugges-
14 tions for some things one might do in terms of -- particularly
15 in the insider problem of additional switching, or permissive
16 switching of systems which we did not look at.

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 Originally this program was intended to take some ideas
2 that looked pretty neat and pursue those with an architectural
3 engineer to a fairly detailed design. We are proposing now that
4 we not do that, but rather to look at a few other things in to
5 about the level of detail we have here. We have put a lot of
6 emphasis, we have got down the road and looked a lot at some PWR
7 alternatives. We need to verify that those kinds of comments
8 apply to the BWR or to assess that they don't, but to make a
9 definite look at that.

10 Any additional work with decay heat removal as far as
11 additional systems we think ought to be included in the other
12 program, so that sabotage is another thing that's considered along
13 with fire protection, flood, and that sort of thing.

14 The question of the insider just needs to be addressed
15 further. There's just no question about that. The idea of what
16 an operator might do to counter sabotage or accident needs to be
17 addressed -- pursued further. The ideas we have established have
18 not really been carried to their ultimate. And we really need to
19 go back at this point in time and look at what one might do to
20 existing plants. The last time we met with the industry group,
21 we discussed this quite a bit; several pointed out to us that,
22 "Hey, Dan, let's face it: since March of 1979 we haven't ordered
23 many new plants. And we'd better be looking at what might be
24 done and what could probably be done, if anything, to existing
25 plants." And we discussed this with Mr. Michelson a month or so

-2

1 ago, and I think he would agree with that last recommendation. We
 2 need to go back and look at what might be done.

3 Obviously, things like adding system come to mind, but
 4 we have not analyzed it from that standpoint as to cost. Any of
 5 the cost data you see here was strictly new construction, was not
 6 retrofit. We never considered retrofit in the cost (WORDS UN-
 7 INTELLIGIBLE).

8 That's pretty much a quick and dirty look at this
 9 program and where we think we need to go.

10 DR. SIESS: Is your cost on the hardened decay heat
 11 removal system, was as new construction?

12 MR. ERICSON: As new construction. And those cost
 13 figures are construction dollars, do not include cost of money
 14 and all that sort of thing. And as I said, the industry people
 15 suggested at least 50 percent low even then.

16 And those were 1978 dollars, so already they're 20 per-
 17 cent low.

18 DR. SIESS: Now, Oconee is -- are they actually building
 19 their dedicated heat removal system at Oconee?

20 MR. ERICSON: Yes, sir, as far as I know.

21 DR. SIESS: To serve three plants?

22 DR. ERICSON: That's for three, yes.

23 DR. SIESS: Three systems or one?

24 MR. ERICSON: I think it's a single system that serves
 25 all three.

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 DR. SIESS: What's it cost, do you know?

2 MR. ERICSON: More than ten million, I believe.

3 DR. SIESS: That is three plants' worth.

4 MR. ERICSON: Yeah. But, on the other hand, since it's
5 a single system, you can't divide the cost number by three, either.

6 DR. SIESS: No, but we've got an awful lot of multiple
7 units.

8 MR. ERICSON: Right.

9 DR. SIECS: And on your decay heat removal system, that
10 applies equally to PWRs and BWRs?

11 MR. ERICSON: That's a question we need to address
12 further. We've done some preliminary looking, but we haven't --
13 we haven't -- I'm not ready to make that statement.

14 DR. SIESS: You've mostly looked at PWRs?

15 MR. ERICSON: Yes, sir.

16 CHAIRMAN MARK: Is it your impression that things will
17 not really be very different?

18 MR. ERICSON: That's my impression today.

19 DR. SIESS: Well, the Germans are using them on BWRs.

20 MR. ERICSON: My feeling is that we're not going to see
21 a lot of difference.

22 DR. SIESS: I don't want feelings, though.

23 And what I didn't hear, or maybe I just missed it, is
24 the -- a distinction, if there is one, between prevention and
25 mitigation. Has that been a way of looking at it here? Or do

D-4

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 you just feel that they --

2 MR. ERICSON: Well, certainly, the design would -- the
3 designs we looked at were aimed at preventing, yeah. We were
4 looking at the damage control more as the mitigating -- or do
5 something about it given that you've got to.

6 Design to mitigate -- I guess we haven't really pursued
7 that, if I understand that's the way you're phrasing the question.

8 DR. SIESS: Yes. It's basically a prevention problem.

9 DR. LAWROSKI: Do you regard the spent fuel, though, as
10 a, as one of the important areas?

11 MR. ERICSON: At certain times. Now, that's -- that's
12 a personal prejudice. I think there are some time windows in the
13 spent fuel area in which you are very concerned immediately after
14 discharge. But at long times I think you have --

15 DR. DIESS: What about radwaste?

16 DR. LAWROSKI: Well, let me -- may I pursue that a
17 little further? Now, isn't that one from the standpoint of
18 structural design, one that could be altered quite a bit by
19 whether you have the thing below or above grades, or as vulnerabil-
20 ity to --

21 MR. ERICSON: Certainly.

22 DR. LAWROSKI: -- leaking of water?

23 MR. ERICSON: If it's below grade it's much more diffi-
24 cult to get the water out. No question about that.

25 DR. LAWROSKI: Okay. Well, that's --

MR. ERICSON: On the other hand --

DR. LAWROSKI: That would be one, then, that --

MR. ERICSON: On the other hand, it may be much more cost-effective to rely on damage control and provide other ways to put water in. And it's hard for me to envision getting all the water out in very, very short periods of time.

DR. SIESS: Again, it would depend on whether it's built or not.

MR. ERICSON: Yes, most certainly.

DR. SIESS: What about radwaste?

MR. ERICSON: Our criteria was in excess of Part 100. And it's very -- most radwaste you're not going to exceed Part 100 criteria at the boundary.

DR. SIESS: The Part 100 criteria don't really make much sense after Three Mile Island, do they? I mean, we had releases less than Part 20 at Three Mile Island, and it's had a traumatic effect on not only the people but the NRC and the industry. And Part 100 dose limits go along with some source terms and other assumptions; they're not real doses.

MR. VARNADO: No, but Part 100 dose limits are the criteria that are used in identifying vital areas, that NRC uses in identifying vital areas.

DR. SIESS: I know they do. But I don't think it makes any sense.

MR. VARNADO: Well, that's --

D-6

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 (Laughter, several comments at once)

2 DR. SIESS: The Part 100 dose limits along with reg'
3 guide 1-3 and 1-4 and a few standardized calculations for picking
4 sites is one thing. But Part 100 dose limits as consequences to
5 a population are absurd.

6 I mean, right now, if somebody sabotaged a radwaste
7 tank and put out even Part 20 limits in a day, as little as Part
8 20 limits in a day, you know, that's ten times as bad as Three
9 Mile Island.

10 MR. ARSENAULT: Mr. Chairman, if I may?

11 CHAIRMAN MARK: Yes, Frank.

12 MR. ARSENAULT: I think the point here was simply to
13 offer the contractor some --

14 CHAIRMAN MARK: Can't hear you.

15 MR. ARSENAULT: -- some criterion on the basis of which
16 he could determine which of these things he was going to consider
17 and which not.

18 There's a probabilistic distribution associated with
19 any release resulting from a sabotage event. The point here was
20 simply to indicate that we are concerned with sabotage that
21 results in small releases. Part 100 was a convenient benchmark
22 to use.

23 DR. SIESS: But Part 100 is a big release.

24 MR. ARSENAULT: Well, it's a --

25 DR. SIESS: It's a heck of a big release.

0-7

1 MR. ARSENAULT: It's big from -- it's big in connection
2 with, or in comparison to minor accidents and so forth. When
3 you consider sabotage, if you want to go to the smaller events,
4 the possibilities there, I think, the potential there extends the
5 requirements for protection considerably.

6 DR. SIESS: That's right.

7 MR. ARSENAULT: And if you -- if you choose to do that,
8 that's one basis for reviewing studies.

9 This was a benchmark.

10 DR. SIESS: Well, at some point, I guess, somebody's
11 got to look at the motivation of the saboteur. At one time we
12 used to use embarrassment as a motivation, and I guess that was
13 the case at North Anna, was it? They certainly didn't hurt any-
14 body by putting the caustic on the fuel, but they got a lot of
15 publicity -- not very good publicity. And I could visualize
16 somebody hitting the radwaste tanks at every one of Commonwealth
17 Edison's plants, which wouldn't be major releases but it would
18 shut down all the power in northern Illinois. Which might
19 bother Dr. Lawroski more than it would me. But --

20 (Laughter)

21 MR. ARSENAULT: I trapped myself by responding to that.
22 What I actually wanted to mention was going back to the point of
23 mitigation, a point of clarification.

24 The two places where that word might be applied in this
25 case, we're talking about prevention of a release and we want to

D-8

1 speak of mitigation of the release after the release. But then
 2 there's the question of an initiating event and mitigation of the
 3 sequence that ultimately would end in a release.

4 I think the study does deal with that latter type of
 5 mitigation -- damage control and various actions to reduce the
 6 end effect of a sabotage event. So I wanted to make that clear.

7 CHAIRMAN MARK: I don't think we can draw a new line
 8 other than your Part 100 here today. There is certainly some-
 9 thing very much in what Dr. Siess was just saying. But there's
 10 also the opposite of that: that if you know that Part 100 is,
 11 indeed, an upper limit for the mayhem that might be raised, then
 12 you can put it in a separate box as not being like a hydrogen
 13 explosion which may or may not happen. If Part 100 is an upper
 14 limit, then it puts the question in a lower scale than if you are
 15 capable of putting out 10 percent of all the fission products in
 16 the air, which some of the scenarios would certainly allow if
 17 you didn't guard against it.

18 I have a question on this. I wonder if it will come
 19 up later, from the staff's discussion. How much the work which
 20 you have described which has been done has amounted to in the
 21 research budget and how much the recommendations that you make
 22 would amount in the budget which we will need to be considering
 23 in numerical detail.

24 You, presumably, know what this has meant in fiscal '80
 25 and is down for it in '81. And I don't know, Arsenault or someone

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

-9

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 34-2345

1 or Durst will tell us later what --

2 MR. DURST: What you said about making the numbers,
3 these monies are not in the '80 or the '81 budget; these are
4 previous monies. The project was slightly delayed for a variety
5 of reasons, so the monies that were spent were from prior years.
6 And the monies that are remaining are authorities to spend which
7 were carried over from the FY '78 budget, which was the last
8 funding year.

9 DR. LAWROSKI: Is this all labeled research, then?

10 MR. DURST: In '78.

11 DR. SIESS: Is the program on assessment of alternate
12 LWR shutdown heat removal concepts a research program?

13 MR. VARNADO: Yes, sir, it is.

14 MR. ERICSON: That would be improved safety program.

15 DR. SIESS: That's the improved research, that safety
16 program?

17 MR. VARNADO: Yes.

18 DR. SIESS: Who's doing that?

19 MR. VARNADO: We are.

20 DR. SIESS: You are.

21 CHAIRMAN MARK: Now, I'm not sure if I followed. Does
22 this mean that in discussing the '82 budget request this item
23 would not need to appear at all?

24 MR. DURST: That is correct.

25 CHAIRMAN MARK: Good.

DR. SIESS: But the shutdown heat --

(Laughter)

But the shutdown heat removal study would?

CHAIRMAN MARKS: But that's not a Safeguards item, however. Not a Safeguards item. That's an improved safety research decision unit.

DR. MOELLER: I found it an interesting discussion, but I am troubled by the bottom line, and that is the conclusions, because I don't understand them. Dr. Lawroski raised a question, and I thought perhaps that would help me but it really didn't. Your conclusions are: number one, that structural design changes alone do not appear to provide significant additional protection; then, number two, design changes -- now I don't know whether those are structural design changes or not -- but you say design changes can facilitate implementation of physical protection. So those, one says they do not alone do much, the second one, I guess, meant to say that in combination with other steps they do.

Could you help me with your conclusions once again?

MR. ERICSON: I think you have addressed it just right, Dr. Moeller.

DR. MOELLER: Okay. In combination, then, with --

MR. ERICSON: That's right.

DR. MOELLER: -- other things.

MR. ERICSON: In assessing the impact of changing the design, the layouts and that sort of thing, we tried to keep the

0-11

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 implementation of physical security -- that is, guards, bells,
 2 whistles -- constant. Just changing the way I built the plant
 3 didn't change much. However, I recognize that changing the way
 4 I build the plant may facilitate, may help me to implement the
 5 requirements of 73.55 in a different way. And so I think you
 6 have grasped what we were --

7 DR. SIESS: That goes back to the differences in the
 8 completely separated buildings and just the separated compart-
 9 ments.

10 MR. ERICSON: It just -- it allows you to do some
 11 things you might not otherwise do. It allows you perhaps to
 12 concentrate some security.

13 DR. MOELLER: Thank you. That helps me on that one.

14 The other point I did not understand, which also was --
 15 a question was asked but I didn't follow: in terms of design
 16 alternatives, you listed turbine runback and I don't understand
 17 what that is in relation to a design alternative.

18 MR. ERICSON: In addressing the concerns of sabotage,
 19 one of the things we normally attribute is that we accept that
 20 we will lose off-site power -- the grid is very difficult to
 21 protect -- which means you then are forced in-house, into the
 22 emergency diesels, in most cases. The question has arisen, well,
 23 can you run the turbines back, what it was, can you run the
 24 turbines back, the main generating capacity, to a lower level
 25 and support your in-house loads just off of that?

0-12 1 I understand that there are some systems that "can do
2 that." But I don't believe any have ever been demonstrated, as
3 part of a licensing in this country, that they can drop to 15 or
4 20 percent of load and then continue.

5 DR. MOELLER: Thank you. That helps.

6 MR. ERICSON: That was the idea.

7 DR. MOELLER: Thank you.

8 DR. SIESS: Does that depend on by-pass capability?

9 MR. ERICSON: Yeah.

10 DR. SIESS: They vary tremendously on that.

11 CHAIRMAN MARK: You say that covers the program as you --

12 MR. ERICSON: As we wanted to present it this morning,
13 yes, sir. Do you have a question?

14 (Pause)

15 CHAIRMAN MARK: Well, when you talk of making it more
16 difficult for outsiders to get in, you're thinking of some number
17 of individuals with wire cutters and scaling ladders and whatever
18 they can carry, maybe more than they can carry. Do you also
19 include in those thoughts the business of coming in with a large
20 transport vehicle?

21 MR. ERICSON: Yes, I think so. But now --

22 CHAIRMAN MARK: Forcibly.

23 MR. ERICSON: -- how far do I pursue this?

24 CHAIRMAN MARK: Forcibly. Well, I think perhaps that's
25 far enough, if that is included in your list of outside possible

O-13

1 maneuvers. If we wanted to go into detail, we'll probably do so
2 in a closed session sometime. But it would come in the orbit
3 of your interest?

4 MR. ERICSON: We have discussed this with Mr. Michelson.

5 CHAIRMAN MARK: Is there more that you'd want to say
6 about that now, Carl, or would we rather go into more deeply at
7 some other time?

8 MR. MICHELSON: No, I think we'd want to address that
9 another time.

10 I would like to make one comment on the --

11 CHAIRMAN MARK: Please do.

12 MR. MICHELSON: -- presentation. It doesn't always
13 come through real clearly as to what we mean now by additional
14 protection. Additional protection against what? Against the
15 external adversary or the insider?

16 I think there are probably very effective ways already
17 of improving protection against the external adversary outside
18 of this study entirely. However, I thought the intent was to
19 address specifically the problem of the insider and what could be
20 done in terms of design changes, layout changes, or whatever to
21 enhance protection in that area.

22 I don't think in the presentation it was ever made
23 very clear to what extent certain of these changes would help
24 against the insider, as opposed to certain others which would
25 probably not be too effective. Maybe they were -- I don't know

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

0-14 1 if you want to take the time now, but it never came through to me
2 too clearly -

3 MR. VARNADO: What the scope --

4 MR. MICHELSON: -- which changes are working in which
5 area.

6 MR. VARNADO: Okay. The scope certainly was not
7 limited, as far as our charter, to looking at insider protection,
8 but rather protection against -- as Dave mentioned earlier --
9 against both insiders and external threats. So --

10 MR. MICHELSON: Well, but my question is very simple --
11 to what extent does any of this help the insider problem? And if
12 it doesn't, then what is it for? Since I think there are a lot
13 of very effective ways of taking care of the outsider problem and
14 by means other than rearranging the compartments and whatever.
15 You can go back now to even more enhanced physical protection of
16 the boundary and things of this sort --

17 MR. VARNADO: Surely.

18 MR. MICHELSON: -- to lay off against these kinds of
19 things.

20 DR. SIESS: Moats, walls, and hot oil, yeah.

21 MR. VARNADO: There are lots of ways of keeping people
22 out. But what do you do about the fellow that's already there?

23 MR. ERICSON: Well, I think what we said there, too, is
24 that plant design per se is not the answer. It may facilitate
25 the way you administratively do the job, but we're right back to

0-15 1 your comment -- there are other things you would have to do to do
2 it.

3 MR. MICHELSON: Yes, and -- but to what extent do what
4 you propose here even help? That never came through clearly to
5 me.

6 DR. SIESS: I thought they made a point that with the
7 separated safeguards buildings or with the dedicated heat removal
8 system this did provide additional protection against insiders.

9 MR. MICHELSON: Well, I'm not sure.

10 MR. VARNADO: It would allow you to implement controls
11 which could provide additional protection against the insider.

12 MR. MICHELSON: Well, my problem is then with the con-
13 clusion. Number one, structural design changes alone do not
14 appear to provide significant additional protection against
15 insiders.

16 DR. SIESS: Well, they didn't consider those structural
17 design changes, because that was multiple systems.

18 MR. VARNADO: Well, without additional access control
19 measures, then those design changes didn't -- if I -- if I have
20 two completely separate trains but everyone has access to both
21 those trains, then I have gained, you know, I really haven't
22 gained anything.

23 MR. MICHELSON: You obviously have gained nothing. But
24 I thought that you had made statements that when you separated
25 you applied equal control to each side. Now, would the control

16 1 apply to each side?

2 MR. VARNADO: The control, you settle the control,
3 essentially --

4 DR. SIESS: The conclusion is not well stated.

5 MR. VARNADO: What's the control as applied in the
6 existing plant? The operator or the -- the loading operator has
7 access to all trains -- to both trains in the plant.

8 MR. MICHELSON: But if I separate the two trains and I
9 make them control separately train A and train B -- which I
10 thought that's what you meant by structural design change -- pull
11 the two apart and put them in two compartments and control each,
12 now you ought to, kind of, intuitively, sort of, double the
13 protection even against the insider, maybe.

14 DR. SIESS: Well, you have to look at the first --

15 MR. MICHELSON: That's Section 1, design structural
16 changes -- and it does not provide additional protection.

17 DR. LAWROSKI: It's a very narrow --

18 CHAIRMAN MARK: By themselves do not, is what they mean.

19 DR. LAWROSKI: Well, it's a very narrow definition of
20 "structural," too, that's used in there.

21 DR. SIESS: It means layout changes by themselves will
22 not do it. But they will, together with other -- they will make
23 other controls work better.

24 MR. MICHELSON: I think it was a good study, it's a good
25 start. But it didn't come through clearly just how it addressed

O-17

1 -- to what extent it would address and help the insider problem.

2 The one other comment I wanted to make is the problem
3 which I did discuss with Sandia a little bit. And that is, when
4 one attempts to go to compartmentalization one has to be very
5 careful about problems if, say, a pipe breaks. As you start to
6 go to small compartments and confine high-energy lines or even
7 water system lines within compartments and put bunkered doors on,
8 or whatever the physical protection, the first thing you know, a
9 pipe break will blow walls apart and create other kinds of
10 problems, if one isn't careful.

11 And I don't know, I think you said you would go back
12 and take a little look at that.

13 MR. VARNADO: We are.

14 MR. MICHELSON: Because if you provide venting, then
15 how do you keep the fellow from going through the venting access
16 to get into the area? And it's a little sticky.

17 DR. SIESS: The one thing that comes through to me is
18 that complete separation by trains, which is, presumably, possible
19 only with new designs, is clearly better than trying to compart-
20 mentalize every pump and valve. And if you're talking about an
21 existing design, the dedicated system, which essentially a
22 separation with a new train, has the same advantages.

23 MR. MICHELSON: Well, Dr. Siess, one other comment in
24 that regard. I think that there is a very positive contribution
25 to physical separation here by going to -- you know, physical

0-18
1 separation for security may also enhance physical protection
2 against pipe breaks or local fires and this sort of thing, which
3 might be well worth the investment alone.

4 DR. SIESS: Well, I think that's one of their points.
5 Because fire protection is an obvious one. And we've seen two
6 older plants that have gone to dedicated systems simply because
7 they could not meet the fire protection criteria by anything they
8 could do to the plant, that is, Oconee and Fort St. Vrain; I don't
9 know how many others.

10 DR. LAWROSKI: But I'm not sure that, although you said
11 that equal attention is given to the insider as well the outsider,
12 I have a feeling, though, that it's the outsider really that is
13 addressed more here in some of the conclusions. I can't -- and
14 I -- one more thing -- I'm not -- I -- for example, in looking at
15 a conclusion, I can look at it two ways, that first one: that
16 alone -- design changes alone do not appear to provide significant
17 additional protection -- now, is that on the basis that I
18 already have a highly invulnerable plant or not? Because I once
19 heard, in the earlier days of these studies, and particularly
20 from the first report, the unclassified one, "Gee, these things
21 are pretty invulnerable, fellows." I'm not sure, and I'm not
22 sure that that was so then, and after TMI-2 I am even less sure
23 that that statement held.

24 DR. SIESS: I'm not sure --

25 DR. LAWROSKI: But we heard it often, though. And I

0-19 1 don't know. You know, including people who advised the utilities
2 that that was the case.

3 DR. SIESS: I'm not sure whether I'm disagreeing or
4 not. But recalling the ACRS concern that -- as addressed in one
5 of our generic items, I would say this has been quite responsive,
6 because that concern was in the form of a question, as what
7 changes in plant design and layout can be made to reduce the
8 probability of successful sabotage. And as that developed in
9 the committee, I don't think there was a strong distinction made
10 between the insider and the outsider. We heard stories on the
11 outsider; we heard stories on the insider. And the basic question
12 was what can you do in the design of the plant, as opposed to
13 simply personnel control, et cetera, that could reduce the
14 probability of successful sabotage. And I think this has
15 addressed that. And I think it's come up with some interesting
16 answers -- or, at least, directions, anyway.

17 DR. LAWROSKI: Directions maybe, but not answers.

18 DR. SIESS: Well, I don't think they've got all the
19 answers.

20 DR. LAWROSKI: I agree with you.

21 DR. SIESS: But I think it's clear from this that
22 separation by trains, or separation by systems, has a significant
23 advantage. Separation by compartments, simply putting a lot of
24 locked doors in there, probably is not going to help you very
25 much. It could louse everything up.

CHAIRMAN MARK: Frank?

MR. ARSENAULT: Yes, Mr. Chairman. Like a lot of other things in the area of safeguards, as soon as you push on it a little bit it starts getting complex. But what does the word "insider" mean? Does it mean anyone who gets inside the plant gate, including the Coke machine repairman? Does it mean an employee? Does it mean the president of the company?

In trying to address this question, we found a good working definition of the "insider" to be anyone who is authorized to be in the location where he exists.

DR. SIESS: That's good.

MR. ARSENAULT: And so, therefore, an employee who may have access to all of the plant including one of the redundant systems but not have access to the second redundant system is an outsider for purposes of protecting the second system.

It's a working definition which seems to have some application in this case.

DR. SIESS: He has to have access. He doesn't have to be smart.

DR. MOELLER: But it helps.

DR. SIESS: As Carl Michelson postulated, the dumb insider in cooperation with a smart outsider could do quite a bit of damage if he can get to things. And he doesn't have to get to them simultaneously within the same day. I mean, if you have auxiliary operator A assigned to train A and auxiliary

1 operator B assigned to train B and they trade off at weekly
2 intervals or monthly intervals, I'm not sure there are not some
3 scenarios that couldn't be worked out on that basis.

4 DR. LAWROSKI: Did the TMI-2 event, or accident, alter
5 any of this as you were proceeding with the job?

6 MR. ERICSON: Not directly, no, sir. Certainly, it
7 certainly emphasizes, I think, our last recommendation that we
8 made. We were looking at future design. Clearly, we need to
9 go back now, we -- or, at least, "we" in the collective sense, I
10 think, we need to look at the system, at, directly at those
11 questions. No question about that.

12 MR. MICHELSON: May I make one other comment relative
13 to this study but a little afield? We are beginning to see that
14 so-called non-safety-related equipment somehow at some point
15 can have a significant impact on the ability to safely shut down
16 equipment. I'm kind of wondering as a general question now to
17 what extent people are going back and looking at the possibilities
18 of utilizing non-safety-related equipment, maybe in conjunction
19 with only single train safety-related sabotage, other combina-
20 tions, to see what kind of scenarios can be developed about
21 considering the access to even both trains particularly.

22 The non-safety equipment has, some of it has --

23 DR. SIESS: I think that's a case where prevention
24 versus mitigation comes out a little more clearly, since the
25 non-safety-related equipment can initiate an event and you've got

0-22 1 other things that normally would mitigate.

2 MR. MICHELSON: Unfortunately, the information normally
3 available to the operator during the mitigation would be lost by
4 the loss of the non-safety-related equipment, which greatly com-
5 plicates his ability to maneuver.

6 CHAIRMAN MARK: Then you make everything automatic,
7 Carl.

8 MR. MICHELSON: Well, that's another issue.

9 (Laughter)

10 But it's something, I think, that one might want to
11 (WORDS UNINTELLIGIBLE).

12 DR. SIESS: All you have to do then is sabotage the
13 computer.

14 CHAIRMAN MARK: Dedicate and shutdown computer?

15 DR. SIESS: Like air traffic control or early warning?

16 CHAIRMAN MAPK: But I think that has brought in sight
17 the sabotage protection studies, and holding back on the thing
18 which is presently listed as item -- from SAI. It would be
19 appropriate for something, at least, a half an hour's discussion,
20 which is not going to complete it, of item III in this agenda, of
21 the FY '82 research program, if that's agreeable to Tomlin.

MR. TOMLIN: I am Jerry Tomlin, the branch chief for Safeguards Research. I want to talk a little bit about our plans for FY 82.

Our program is broken into three areas, which you can see there: physical protection, material control and accounting, threat and strategy. I want to talk briefly about what our objectives are in each of these areas.

MR. MARK: Could I ask if threat and strategy is identical with what a year ago was referred to as alternative strategies?

MR. TOMLIN: Yes, very similar.

The regulatory objective for physical protection is to assure that the licensee provides adequate protection against malevolent actions directed towards sabotage or theft of special r clear material.

The means to achieve the regulatory objective is the sort of stepping-off place for our research program. The selection of appropriate performance criteria, many of which you have heard discussed this morning already, and the evaluation of safeguards against these criteria.

Our research objective then is to support the regulatory objective by the development and application of physical protection, criteria selection aids, effectiveness evaluation aids and other studies.

In like manner, the material control and accounting

1 area, the research, the regulatory objective, to assure the
2 licensee provides adequate protection against changes of
3 special nuclear material location, quantity or composition
4 which could contribute to theft or sabotage.

5 In like manner, the means to achieve that objective
6 are selection of appropriate performance criteria and then
7 evaluation of safeguards against those criteria.

8 The research objective which follows is to support
9 the regulatory objective by the development of material control
10 and accounting, criteria selection aids, effectiveness evaluation
11 aids and other studies.

12 Threat and strategy research, the regulatory objective,
13 to ensure that NRC bases its regulatory activities and
14 operational responsibilities on the best available information
15 concerning threats and consequences of successful adversary
16 action.

17 The means to achieve this objective are to do threat
18 studies, consequence studies and incident response studies.

19 The research objective, which we have developed, is
20 to support the regulatory objective again by the development
21 of better understanding of threats, consequences of theft or
22 sabotage, and incident response.

23 Taking these three areas which we have just discussed,
24 I would like to run down very quickly what we have planned for
25 the future. You can see on the top our FY 80 budget, what we

3 1 are spending in FY 80.

2 MR. MARK: Could I ask, going back to your previous
3 things -- incident response, which you mention only in the
4 third group --

5 MR. TOMLIN: Yes.

6 MR. MARK: -- I had thought there had been a great
7 deal of incident response studies under physical protection
8 and transportation of SNM, which covers under the first two
9 groups.

10 MR. TOMLIN: There have been. It is just a matter
11 of how we categorize them here. There have been a great deal
12 of studies done under physical protection which I will show
13 you as we go forward.

14 MR. MARK: It would be expected that those would
15 continue?

16 MR. TOMLIN: That is right.

17 MR. ARSENAULT: Jerry, isn't it true that this
18 refers primarily to nonlicensee response? It is the same
19 problem?

20 MR. TOMLIN: That is right.

21 MR. ARSENAULT: Nonlicensee response is distinct from
22 the licensee's immediate response --

23 Under the category of threat and strategy the
24 incident response category refers to the nonlicensee actions,
25 right?

4
1 MR. MARK: Nonlicensee actions? Like local law
2 enforcement?

3 MR. TOMLIN: Local law enforcement, FBI.

4 MR. MARK: Classified or nonclassified transportation
5 routes?

6 MR. ARSENAULT: That is right.

7 MR. MARK: Excuse me.

8 MR. TOMLIN: Okay. What I would like to do is --
9 well, when we go over the dollar -- -- we indicated the level
10 of spending in each of those four years, what we are spending
11 in FY 80 in total for that area, the area of physical protection,
12 for what we plan to spend in FY 81, what we are requesting in
13 FY 82 and FY 83.

14 Then I would like to go down through a listing of the
15 projects that are covered in this area. The first project is
16 the large Sandia project, which you have heard in some detail
17 last year. I gave you a detailed briefing on that project.
18 It is an ongoing project since about 1976 and will be
19 continuing development of the technology base for fixed site
20 physical protection.

21 The second project is a very similar project for
22 transportation, physical protection. That project will be
23 winding down in the next year, probably in 1981. You heard a
24 briefing on that also last year about the same time.

25 The third project, inspection methods, is a project

1 that was begun last year. We are doing it at the request of
2 I&E, basically developing improved and new inspection modules
3 to help the field inspector in the area of physical protection
4 as he goes around inspecting primarily reactors.

5 The fourth project, safeguards for proliferation
6 resistant fuel cycles, is also a new project we are doing, just
7 getting started, looking at possible new impacts on safeguards
8 from some of the cycles that were recommended by NASAP (?).

9 The last project on this sheet and the first project
10 on the next sheet are related.

11 MR. LAWROSKI: In what connection are you looking
12 at those?

13 MR. TOMLIN: Well, it is a very low level funding
14 project in which we are primarily responding to a congressional
15 mandate, which we were asked to write a report, an annual
16 report on these things.

17 MR. SIESS: Which item are you talking about?

18 MR. TOMLIN: Proliferation resistant fuel cycles,
19 right.

20 MR. MARK: It has escaped me, there were some high
21 class proliferation resistant cycles that everybody is about
22 to use or something?

23 MR. TOMLIN: Yes.

24 MR. MARK: I thought it concluded there really wasn't
25 anything you could do.

6
1 MR. DURST: I think what you have said is indeed
2 what we think is to pave this project support, NMSS, who was
3 required by congressional action to make continuing surveys
4 and semiannual reports to the Congress on their evaluations
5 and the -- -- recommendations impact.

6 This project supports that NMSS planned effort.

7 MR. LAWROSKI: Is that what it consists of and limited
8 to that?

9 MR. DURST: That is correct.

10 MR. LAWROSKI: Okay. That is why it is small?

11 MR. DURST: It is very small.

12 MR. TOMLIN: Yes, it is very small.

13 MR. DURST: I believe it is in the nature of
14 \$100,000?

15 MR. TOMLIN: Yes, or 150, and it should be finished
16 before 1982. In fact, if we are just talking about 1982, it
17 wouldn't even appear on this list.

18 This top project here is a project we are doing. This
19 particular one will be out on RFP. We are evaluating bids on
20 it right now. It is done in conjunction with the previous
21 project, the last project on the previous slide. It is to
22 look at vulnerability of spent fuel shipping casks. We are
23 actually doing some experiments in impacting these casks with
24 shake charges to see what the source terms that might result
25 from that.

1 MR. SIESS: What does secondary mean there?

2 MR. TOMLIN: Secondary would be a radiation leak from
3 a secondary location, not the prime location where the shake
4 charge hit it. There are internal pressures in the casks
5 that are sometimes secondary areas for release.

6 MR. SIESS: Where does the primary come in, somewhere
7 else?

8 MR. TOMLIN: The primary is the location where the
9 cask is hit by the explosive charge, by the --

10 MR. SIESS: Yes, but this says you are doing source
11 term characterizations and secondary violations. Are you doing
12 something on primary violations?

13 MR. TOMLIN: Yes, that is the first one. Shipping
14 cask sabotage source term assessment. There are two projects.
15 That one is currently being done at Battelle.

16 We are talking about the last project on the first
17 slide --

18 MR. SIESS: Yes.

19 MR. TOMLIN: -- and the first project on the second
20 slide.

21 MR. SIESS: I guess I don't understand why they are
22 separated. If I knock a hole in a cask with a shake charge
23 and I get out 50,000 curies, am I worried about 500 curies
24 coming out of another hole?

25 MR. DURST: I think I can answer your question. This

1 is a much studied problem by Bill McGee in research at Sandia,
2 and as a result of those studies there was a ranking made of
3 what were apparently developed with probable vulnerabilities
4 of central casks.

5 They are both vulnerable to a shake charge
6 penetration. There is relative ignorance about what impacts
7 upon source term rejection from the assault that would occur.
8 The project was designed which is being executed by Battelle
9 Laboratories, and there is an engineering project which in
10 effect may penetrate and stale fuel which is penetrative
11 within a hot cell, and will come up with data which will at
12 least give some -- -- information on the type of releases
13 which the shake part penetration would make.

14 MR. SIESS: That is the first one.

15 MR. DURST: That is the first one. The second most
16 probable method of attack, one which would be more simply
17 executed and one which would demand much less fuel, the
18 adversary, is in effect a massive blast attack or perhaps a
19 more sizeable nuclear attack or even a fairly massive shake
20 charge attack.

21 This would create the primary release exits by
22 the rupturing of some secondary parts of the cask, because of
23 pressure set up within the cask and it would blow off.

24 MR. SIESS: And as you would destroy the cooling
25 system or something of that sort but not breach the cask?

9

MR. DURST: That is right. Yes, but in those which have such a cooling system, that would be the cooling system, would be part of the dynamism of the --

MR. SIESS: The second part is where you don't breach the cask due to the --

MR. DURST: The second part is you don't necessarily have to breach the cask. You might, but that is not as important as the fact that what physical action the explosive attack makes upon the cask's ability to stay together and not have a secondary rupture.

MR. SIESS: I understand.

MR. LAWROSKI: What kind of studies are these -- experimental, analytical or --

MR. DURST: The one at Batcelle is extremely experimental. It involves a fairly difficult engineering to permit actual stealing of the radiated material, the spent fuel pens, they are in a hot cell and do not blow the hot cell apart at the same time. That one is going on right now.

The secondary one is just the study for final word on the response to request for bids, and I am not privy to the three or four that have been offered as the final for the competition because they still have not been decided.

MR. TOMLIN: Okay, the next project is explosive attack on spent fuel pools. It is a new project that we are hoping to get started in 1981. In fact, the next ones on the list

10 1 are, beginning with explosive attack on spent fuel pools on
2 down, are all new projects that would be started in 1981 --
3 well, the next three would be starts in 1981 -- explosive
4 attack on spent fuel pools, spectrum of graded safeguards, and
5 power reactor safety/safeguards interface, which is the
6 discussion we have just had.

7 Those would be planned for an '81 start. The next
8 three we are talking about an '82 start for those projects.

9 The second subject, the second subelement of our
10 total program, material control and accounting: in FY 80 we
11 are currently spending at the level of a million dollars. The
12 plan for '81 is 1.4. The requested level for '82 is 2.4 and
13 for '83, 2.5.

14 The first project is the large project at Lawrence
15 Livermore Lab that you were again briefed on last year about
16 this same time. We gave a detailed briefing on their
17 development.

18 That project is planned to continue.

19 The second project, the material holdup studies, is
20 a new project which we have not yet initiated, but we are in
21 the final stages of developing the final statements of work and
22 working, that is a project that was requested by the Office
23 of Standards Development.

24 The third project, strategic analysis for safeguards
25 system, is a new project planned to start in '81. It is looking

at basically the interrelationship of physical security and material control and accounting, and it will be answering some fairly specific questions.

The last project is a request that we have just recently received from the Office of Standards Development in which there is a program at National Bureau of Standards which is being phased down at the end of this year. This is one of the developments in that program at National Bureau of Standards that looks very promising. And the Office of Standards Development would like to continue funding that project.

We are in the process now of considering getting that funding and --

MR. SIESS: Who is funding it now?

MR. TOMLIN: It is being funded by the Office of Standards Development at National Bureau of Standards.

MR. SIESS: As effect of the systems program?

MR. DURST: No, not this specific project.

MR. TOMLIN: Not this specific project. This is an outgrowth of the project at National Bureau of Standards.

MR. SIESS: Okay.

MR. MARK: You say that is very promising. What does it seem to promise -- that you can do by a different means what you can already do or what?

MR. DURST: I think you are familiar with the program

12

1 of about five years, jointly with NRC, which the National
 2 Bureau of Standards executed. It was quite a sizeable
 3 program which went about a million and a half dollars a
 4 year.

5 It was a continuous program which took essentially
 6 a series of projects, four or five, in the areas of measurement,
 7 and pursued those projects under National Bureau of Standards
 8 supervision to create improved measurement standards for the
 9 nuclear industry.

10 That program is not to be funded in FY 81 by either
 11 DOE or the National Bureau of Standards. Now I can't be --
 12 DOE may. I don't think DOE intends to make its contribution
 13 to the joint program. I know that the NRC does not.

14 The Office of Standards which was in effect the
 15 project monitor and in effect the NRC manager of the previous
 16 joint program has asked that this element which was proposed
 17 as a part of the much larger program if the NBS program had
 18 continued, be undertaken within our own research money. In
 19 effect, it is one part of a larger program which is about to
 20 die or has died, which the Office of Standards thinks has
 21 unique merit and wants it to be --

22 MR. LAWROSKI: What are the unique merits? You
 23 haven't answered Dr. Mark's question. What are the unique
 24 merits of this measurement scheme?

25 MR. DURST: I have not seen, nor has the office seen,

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554 2345

1 the technical details that would say what the unique merits
2 are. This is a request from Standards to us stating that they
3 want some research in this area, and they are going to define
4 their needs and give the request to us.

5 MR. MARK: I can understand that it is new and
6 different to use resonant neutron radiography. If you can already
7 measure the U-235 without doing that, then you can meet the
8 safeguards objective with existing equipment. Maybe you
9 can't.

10 So I was really asking what capabilities, what new
11 capabilities are opened up by doing this rather fancy and
12 advanced type of neutron radiography.

13 MR. TOMLIN: Dr. Mark, I think --

14 MR. MARK: Is this the NBA way of --

15 MR. TOMLIN: Dr. Bob Shepherd, who is the, will be
16 the project manager for that, maybe he can answer your
17 question.

18 MR. SHEPHERD: It is the feeling of Standards, the
19 Standards Bureau, the Office of Standards Development, NRC and
20 Bureau of Standards, that this technique may prove to be a
21 calibrate of reference -- -- technique that will calibrate the
22 measurement of U-235 across the industry.

23 I am not sure, but it seems to be promising in terms
24 of reference calibrating techniques.

25 MR. MARK: I am not fully clear yet. If we don't yet

14
1 measure 235 well, then I can't think of quantities we could
2 measure, and I rather think that previous measurements of 235
3 as done by NBS and as put out in the standards, with a given
4 counter operating in a given way and a given sample at this
5 following spot, you can compare the number of grams 235 you have
6 got in this box with the standard number, which is 107 that
7 is in that box, and that that technique has been used for
8 something, and improved I am sure, for something like three
9 decades.

10 But this would replace it? I think it might warrant
11 study to see if it could duplicate the results, but I can't
12 see why it would be likely to give us more accurate measurements
13 of the 235 atoms.

14 Frank, are you familiar with this?

15 MR. ARSENAULT: I am not intimately familiar with the
16 project. I do know that the Office of Standards Development
17 is seeking wherever possible to provide secondary references
18 that can be used within the industry.

19 MR. MARK: If there is an easier way to use this in
20 the field, that of course would have a very important aspect.

21 MR. SHEPHERD: That is the aspect that they will be
22 looking at, being able to use it in the field -- see, the whole
23 point is that the standards or the measurements must be
24 referenceable back to NBS.

25 MR. MARK: Absolutely.

15

MR. SHEPHERD: Okay. And in doing that they see this as a tool whereby initially the Bureau of Standards will be the laboratory that does the reference measurements.

Okay, but then the technique hopefully will be moved from the Bureau of Standards into the field.

MR. MARK: Clearly that is what really matters, and if it is easier to use or calibrate across a wider range of compounds or something, then it has possible value.

I am still a little bit --

MR. DURST: I thought we had enough of those --

MR. MARK: I thought that the effort put on measuring 235 should have wound up that subject pretty well.

I am a little bit concerned with what wasn't an answer to my question, Jay; namely, that you stopped the development of standards even while they go on looking at proliferation resistant fuel cycles, for which standards obviously don't exist.

MR. DURST: The NRC has stopped its money in that joint project, that is correct. FY 80 was the last year in which funding for that joint project was in our NRC funding.

MR. MARK: And are we in the position that we have cross-reference standards for places like Barnwell or wherever else?

MR. ARSENAULT: It might be worth a few comments. First of all, the National Bureau of Standards, the AEC I think

it was originally, I have subsequently heard, and the regulatory staff and subsequently the NRC. I have mentioned those to give you an idea of how far back it goes.

We viewed the question of what program should be instituted at NBS to support the industry in its nuclear materials measurements.

The conclusions of a working group were that the NBS should establish a program of technology development, measurement technology development, reference standard production, and workshops to transfer into the industry the capability of doing calibrations of secondary references that would allow their measurements to be traceable to National Bureau of Standards measurements.

Such a program was developed by the National Bureau of Standards and proposed through their budgetary procedures to the OMB, supported by -- I am not sure if it was DOE or ERDA at that time, and the NRC.

OMB in what appeared to be a fitful attempt, fitful last attempt, to maintain the concept of lead agency, suggested that the program was a good one and provided the people at NBS but not the funds, suggesting that they get the funds from NRC.

We had not funded for the program but were able by stretching out and decreasing the level of effort in other programs to fund that program to the tune of -- I have forgotten

17 1 whether it was \$1 million or \$1.4 million -- during the first
2 year.

3 MR. MARK: That is about 1979 or something?

4 MR. ARSENAULT: Yes, about, or 1978.

5 MR. MARK: 1978 perhaps.

6 MR. ARSENAULT: This was done by the Office of
7 Research merely because we happened to have the largest
8 available pool of funds, not necessarily because people thought
9 it was research. They did not.

10 The second year it was taken over by the Office of
11 Standards Development and funded. Their interest waned. They
12 have decreased their funding two years running and have
13 terminated, as I understand, terminated the program.

14 It is my understanding that this particular project
15 is seen by the Office of Standards Development to be one that
16 offers promise for providing secondary standards that will
17 allow industry to trace their measurements to the National
18 Bureau of Standards.

19 I personally have not evaluated it. We haven't looked
20 into it deeply. It is a program that if I understand correctly
21 will start in 1982. We have had lots of time to review it in
22 detail before we in fact issue the funds.

23 So that is where it stands right now.

24 MR. LAWROSKI: Has a group of analytical experts
25 looked at this?

18

MR. ARSENAULT: Well, as I have indicated, what we are doing at the present time is responding to the Office of Standards Development's perception of a need and a value in pursuing this project. One can only assume that in their management of the NBS contract, both their staff and the NBS have made this determination on the basis of some analysis.

We have not yet gotten into the act, as it were. We are in a responding mode at this time. We will of course be doing our own independent assessment of the value of this project. We are in fact monitoring for it.

MR. SIESS: Is it possible that they have simply run out of technical assistance money and would like for Research to fund it?

MR. ARSENAULT: Well, it is always possible, but this is, as I understand it at this time, more by way of a developmental project, and I would think it falls within the definition of research as used in the NRC.

MR. SIESS: And the other program didn't?

MR. ARSENAULT: No. The other program was really a service program, one of actually making available reference standards of conducting workshops for industry, of developing measurement capabilities at NBS which would then be transferred to industry.

It was much more an industrial support program, which was the basis for my feeling that the NRC should not be funding

24
25

it to begin with. But by squeezing it into a hole, the Office of Standards Development thought it to be much more responsive to their own direct needs. And it was in my view a legitimate if somewhat strained technical assistance program.

MR. MARK: I see, this isn't really a research program, I admit. I am not sure it is industrial support. It is industrial support or was originally. It now has other aspects, however. It comes up in a way which whether it is research or not must be a rather central concern to NMSS, whether or not the people who handle, receive, ship, and check inventories of this raw material are in a good shape for all mixtures of all compounds that appear normally, like this is carbide, this is oxide, so you get a different signal this time, and so on.

Are we all through with what is needed for secondary standard comparisons? Paul Baker?

MR. BAKER: I am not aware, I will put it this way, I am not aware of NMSS having reviewed this particular one at all.

MR. MARK: Well, how do you -- NMSS must be concerned whenever MUF is waved around. And the only way you know whether there is any MUF or not is whether this measurement and that measurement are properly cross-calibrated and the difference has any meaning.

MR. BAKER: That is correct.

1 MR. MARK: And one was made in San Diego and the other
2 was made in Pennsylvania by students of a different school.

3 (Laughter.)

4 MR. LAWROSKI: That is only a part of it though.

5 MR. MARK: Oh, I know, it is just the most easy to
6 describe.

7 MR. LAWROSKI: Because this will measure for you,
8 what, presumably some concentration or something like it. Now
9 you have to multiply it by something that probably has an
10 uncertainty; namely, whether it is volume or weight, because
11 you have a very poor representation of sample to get a product
12 that then represents something that gets involved with MUF.

13 Are we keeping pace in the degree of accuracy which
14 we measure U-235 with the way we can measure the material in
15 storage in whatever form, waste or what else, the volume or
16 mass of it and homogeneity?

17 MR. DURST: I can give a partial answer to that,
18 although --

19 MR. LAWROSKI: As you know, we can measure the hell
20 out of accuracy to a fair you well and maybe not be much better
21 off when it really comes to the industrial problem.

22 MR. ARSENAULT: One of the advantages of what are
23 loosely categorized as nondestructive techniques, such as
24 neutron resonance --

25 MR. LAWROSKI: Well, I asked earlier whether there was

21

an NBA and I didn't -- nobody --

MR. ARSENAULT: I guess I didn't hear the question, but both neutron transmission, neutron resonance spectroscopy measurement techniques are -- I will use the word "inherently" nondestructive, except that I may be contradicted.

And one of the major difficulties in nuclear materials measurement in the nuclear industry right now is measurement of scrap in various containment. I believe that it is foreseen that this would have its principal advantage in that area.

MR. LAWROSKI: Well, that is what I wanted to hear, but whether that is a unique capability, that this offers prospects of that, or whether that is just a guess on your part now.

MR. ARSENAULT: Well, I know that the application to scrap measurement is foreseen. Whether or not that is the principal motivation behind this development I don't know.

MR. LAWROSKI: Los Alamos is you know, they are keeping it --

MR. ARSENAULT: Also, I think that I would not refer to this technique as a unique measurement capability because there are other approaches to the problem of measuring.

MR. LAWROSKI: Granted.

MR. ARSENAULT: I have already indicated that we are at this time somewhat in a responsive mode to those who we

presume have studied the thing adequately.

We of course will perform our own evaluation before we contract for this effort. But unless some of the staff is able to address this more fully than I, I have to admit to no definite knowledge.

MR. MARK: Questions of this sort certainly come up in things like the Livermore program. They have got to measure the atoms both at this end and that end of the pipe, and concentration is changed between the two ends and things like that. I don't know how much of that program, which is largely analytical, really relates to checking how good the measurements inherently are.

MR. ARSENAULT: The technique, as with neutron transmission techniques, and x-ray and gamma ray absorption techniques, offers promise for both nondestructive and in-line measurements.

Now I know that that promise is there. Whether that is the motivation for the development of this I do not know. I would point out --

MR. MARK: I guess I was speaking not so much of the resonance radiography as of the solid, solidity of our position in general.

MR. ARSENAULT: I was about to point out that contrary to my own inclinations as a matter of fact, the ACRS recommended last year that we direct more attention to the improvement of

materials measurement capability accounting systems.

MR. MARK: I am not sure we knew enough to know that we had to do that, but we felt that it was basic to the whole attempt to keep control.

I wanted to ask, I think we have done what we can with that at the moment, as you say, it is going to be considered further, the neutron resonance techniques --

MR. ARSENAULT: Yes.

MR. MARK: -- are still to be talked through.

Material holdup studies. I think I can understand where that comes in. I saw a reference somewhere in your plans to considering designs to do something about holdup, and I thought that sounded her s+range. Why is it not that you are just interested in the holdup that is there instead of how you could change it. If you knew what is there, you don't care whether it is half as much or twice as much.

MR. TOMLIN: I am not sure what you are referring to. We are primarily interested in the latter of those two.

MR. MARK: There was something written about the program which sounded as if you were going to work hard to reduce the holdup, or improve the holdup scene in some way, and it wasn't clear why there was much of a need for that.

There may be a lot of need to know how much is in that drain.

MR. LAWROSKI: Well, what is this study of material

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 holdup? Is it -- what do you mean by what you are going to
2 support?

3 MR. SHEPHERD: Mr. Chairman, what we have in mind
4 here is the matter of Dr. Mark said, and that is we are going
5 to be able to determine holdup in areas of the plant such
6 as elbows, T's, joints of this nature, and if we can calibrate
7 and come up with a predictive model that will characterize
8 the holdup along the process in those areas, then we think
9 that we are a long ways ahead in terms of trying to estimate
10 what our holdup is from just an inventory.

11 MR. LAWROSKI: Gee, but that is so design specific
12 that --

13 MR. SHEPHERD: No, we feel that an elbow, a T, or
14 traps of this nature, may not be specific; we feel that those
15 are generic to all plants. That is what we feel. And we are
16 going to utilize if we can the new process plutonium line that
17 is starting up at Rocky Flats to look at the clear solution
18 now that is going through, starting in July, cold solution,
19 and the hydrogen, and compare those analyses with the hot
20 solution that will be running through a little later on.

21 Hopefully, that will be the start of our material
22 holdup study.

23 MR. LAWROSKI: Well, but see, in one case I can
24 arrange to have the elbow, so that there is -- connection so
25 that there is a smooth transition through the thing; in others

1 I can arrange it so that it isn't that. And that is what I
2 mean by site -- the design specific, you know. It will be
3 influenced by how fast the flow is past the darn thing and
4 so on.

5 MR. SHEPHERD: There is a lot of parameters of
6 interest -- the whole range of temperature --

7 MR. LAWROSKI: (interrupting) I don't see how the
8 dickens you are going to get something out of a particular
9 study.

10 MR. SHEPHERD: I guess the whole idea is that we are
11 not clear at this point what the outcome of this study is
12 going to bring, but we do know at this point that material
13 holdup is one of the classical hiding places for material
14 unaccounted for, and we use that as a basis for trying to
15 address that issue and then look at the whole of what comes
16 out of the study.

17 MR. MARK: Well, I can see a great interest of getting
18 in the position of knowing what the holdup is and being able to
19 allow for it. I am a little less clear, when I read in --
20 I think it must be RES', this program description -- the
21 requirements for new or retrofitted fuel cycle facilities,
22 driven apparently by holdup studies. That could only be to
23 change the holdup rather than to -- if you knew it you don't
24 need to change it.

25 SPEAKER (ARSENAULT?): That is not the purpose of the

1 study, however, Dr. Mark. The purpose is to try to get a
2 handle on the vertical factors --

3 MR. MARK: That I can see a great use for.

4 MR. LAWROSKI: Provided you would get.

5 MR. MARK: Of course the need for --

6 SPEAKER: There is every possibility that we can
7 cover all parameters at the site; some knowledge is better than
8 none.

9 MR. MARK: It will have to be plant specific
10 ultimately. Good design may be of some use too.

11 SPEAKER: We may come up with a practice.

12 MR. MARK: It will be different if it is at Savannah
13 River or if it is built on top of a mountain in Denver.

14 MR. LAWROSKI: It is different whether it is sized
15 for 3 percent to 35 or whether it sized for -- --

16 MR. MOELLER: I assume he is nearing the end, but on
17 the previous slide he has the project on explosive attack on
18 spent fuel pools, and I have asked it before, and apparently
19 the answer didn't satisfy me, but it seems to me that the nature
20 of this problem is directly proportional to the amount of spent
21 fuel in the pools at the operating reactors.

22 So my question is who within NRC looks at this
23 problem in conjunction with away-from-reactor storage, and my
24 point being that if we had more rapid movement in developing
25 away-from-reactor storage for spent fuel then the degree of the

27 1 problem at the individual plants, operating plants, would be
2 reduced.

3 SPEAKER: Yes. It might be increased at the away-
4 from-reactor storage.

5 MR. BASSETT: I believe that my presentation is going
6 to deal with that.

7 MR. MOELLER: Thank you.

8 SPEAKER: In that connection, Dr. Moelier, Bill
9 Hawes is here, and in regard to the previous attacks on casks,
10 I think he can give us some clarification on this secondary
11 emission.

12 MR. MOELLER: Right, and that would be involved
13 also?

14 SPEAKER: Yes. The question was raised though as
15 to the differentiation between primary and secondary releases
16 by attack on shipping casks --

17 MR. MOELLER: You are talking about the distinction
18 between the two projects?

19 MR. HAWES: Yes, the first part of the test has to do
20 releases through the -- essentially considered the hole
21 created by the explosive. Take, for example, a shape charge
22 (inaudible) according to a cask.

23 A secondary violation has to do with things like
24 to form the cask with a high -- -- a platter charge or breaching
25 charge, the possibility of blowing off the (inaudible)

1 The reason why we separate it is because from a
2 reference basis (inaudible) selected, it turned out to be a
3 very nice point to separate. In other words, one thing we
4 have ongoing details looking at direct integration, which
5 involves the shape charge, the -- -- tank weapon, and the
6 second study which will be going on very shortly is to cover
7 major breaching charges and power charges which based on some
8 experimental work at Sandia appear to lead us to believe that
9 -- -- to secondary violations if there are violations at all.

10 MR. MARK: Mr. Tomlin, does that cover the points
11 you had?

12 MR. TOMLIN: I have one more slide.

13 MR. MARK: Yes.

14 MR. TOMLIN: Funding here is relatively small compared
15 to the other two. You can see the levels there. Communicate
16 threat assessments and ongoing --

17 MR. SIESS: Large increases though?

18 MR. TOMLIN: I am sorry?

19 MR. SIESS: Percentagewise they are large increases?

20 MR. TOMLIN: Right.

21 (Laughter.)

22 Maybe we know what we are doing in here, maybe we
23 don't. Either reason would apply, I guess.

24 Communicate threat assessments is an ongoing project.
25 It is a cooperative project between ourselves and DOE and NMSS

1 is also involved in sponsoring this. We are working also with
2 the FBI. It is being done at Lawrence Livermore, and Livermore
3 has several subcontractors on it.

4 The consequence estimation probably really shouldn't
5 be in this slide. It is the project that you are going to hear
6 discussed very shortly. There is really no money in it other
7 than some money that, small amount of money that we supplied
8 this year to finish the project. So it really shouldn't be in
9 that list because it shows nothing for 81 or 82 in that
10 funding.

11 The last three are new projects: the safeguards
12 emergency communications project is a project that we envision
13 would begin in FY 81. That is basically a safeguards
14 piggyback on the nuclear data link.

15 The last two projects are projects that would be
16 initiated in FY 82.

17 MR. SIESS: What is the research component of the
18 last one, or those two, I guess both?

19 MR. TOMLIN: The last two?

20 MR. SIESS: They look like interesting projects, but
21 I am trying to categorize them as research.

22 MR. TOMLIN: Okay. The safeguards post-incident
23 project is one at which we would look at events that happen
24 subsequent to a successful sabotage.

25 MR. SIESS: Have happened or postulated?

1 MR. TOMLIN: Postulated. We don't really have any
2 "have happens." They are postulated events. Then we can
3 relate those back into our development of safeguards. How would
4 these events relate to safeguards development, things that you
5 might do to prevent them.

6 The safeguards incident evaluation is really looking
7 at incidents that have happened, if we can learn from those,
8 such as the Three Mile Island incident. How are safeguards
9 impacted by that incident?

10 I think there is probably a good bit we can learn
11 from a study of that, since we have a large number of people
12 on site. Safeguards have to be impacted by that large number
13 of people.

14 A number of the licensees are reporting that they have
15 large numbers of people on site right now. So that is the
16 idea behind both projects.

17 MR. SIESS: Now the incident in the second one is
18 not necessarily a safeguards incident. It is some incident
19 at a plant like Three Mile Island.

20 MR. TOMLIN: Right.

21 MR. SIESS: Is that true also of the other one?

22 MR. TOMLIN: The other one would be more of a
23 safeguards.

24 MR. SIESS: Okay, the postulated would come before
25 the safeguards in that?

MR. TOMLIN: Right.

MR. SIESS: Okay.

MR. MARK: Is there some interlap between the last one on this slide and the middle one on the -- well, power reactor safety, safeguards interface, which is a program -- --

MR. TOMLIN: No, the safety, safeguards interface is following the line of questions we had with Dr. Michelson directly. The relationship of safeguards features in plants and how they impact on safety.

MR. SIESS: Plus or minus?

MR. TOMLIN: Either way.

MR. MARK: I think that was the point that was mentioned by this group a year ago as having a real need to see clearly through, and I guess the kind of thing which has been variously mentioned is going to be the main topic of that safety, safeguards interface which will be presumably a continuation of Sandia work on the --

MR. TOMLIN: Yes, that is the most logical place, right. We are just initiating that project. In fact, we are in the process right now of developing the statement of work for the project.

We have had some inquiries from NRR on the project. They have been quite interested in it. We have discussed it with NMSS and met with a varying degree of response there. Bob Burnett was at least in favor of our developing a statement of

work so that is kind of where we are right now, developing that statement of work.

MR. MARK: I was hoping it would sometime come into the picture when you have each piece of equipment in its own unassailable box and safeguards has been totally looked after, that one may go back and ask whether you can still run the plant.

(Laughter.)

MR. MARK: Safely, huh?

MR. SIESS: If you can't run it, it is safe.

MR. MARK: If that comes to the end of yours, I think it would be time for a break, and we would follow with some remarks, I think perhaps Baker is not necessarily closed, and then closed.

(A brief recess was taken.)

1
2
3 MR. MARK: Let's start with item 5 on the agenda,
4 current status of the rules and guides.

5 MR. ALLEN: Okay, thank you. My name is Tom Allen.
6 I am a section chief in the Regulatory Improvements Branch in
7 NMSS.

8 What I am going to do today is to follow up on some
9 discussions that took place at the subcommittee's February
10 21st meeting when the issue of regulatory guidance came up and
11 there was at that time some apparent misunderstanding as to what
12 guides were in effect now, what types of guidance materials
13 were being used by the staff and by the industry in carrying
14 out 7355, which is the safeguards regulation for power
15 reactors.

16 I am going to recap briefly what we in regulatory
17 improvements see will be happening in the immediate future with
18 respect to changes in reactor safeguards regulations.

19 There is right now a revision of 7355 in the mill that
20 has to do with vital area access. That rule change which
21 basically enforces the need to have access to vital areas in
22 a stricter fashion than has been done in the past, has gone out
23 for public comment, and the comments are in now, and the staff
24 is evaluating them.

25 By November 1st of this year the Commission wishes

1 that a replacement or some other measures to handle the issue
2 of pat-down searches at power reactors will have been put into
3 place, and the staff is now working on alternatives to handle
4 that in the short-term.

5 MR. MARK: Could I ask with respect to the thing that
6 is up for comment on this access to sensitive areas? Is there
7 a proposal embedded in that which is the favored proposal,
8 or are just options offered?

9 MR. ALLEN: No. It is a regulation which requires
10 a more stringent control --

11 MR. MARK: Yes.

12 MR. ALLEN: -- already accessed, and it is done in
13 such a way to limit the number of people who can enter a
14 particular vital area within a facility. The past experience
15 has been that by opening up the procedures for listing the
16 people who can enter vital areas you end up with a very large
17 list.

18 The goal of this particular modification was to
19 reduce the size of the list to only those with true need.

20 MR. MARK: But it does not require that they have
21 had a clearance investigation?

22 MR. ALLEN: No.

23 MR. MARK: Nor that there be buddies?

24 MR. ALLEN: No. We will touch on some developments
25 that are coming up in the clearance area a little bit later on.

1 MR. MARK: And there is an objection to pat-down
2 searches conducted on ladies by gentlemen? Vice versa?

3 MR. ALLEN: I think there is a general objection to
4 it, as an infringement on personal privacy and so forth, and
5 that is one of the concerns the Commission has had and one
6 of the things that we are trying to address in coming up with
7 a viable alternative to that.

8 As I mentioned, that we are required to have something
9 done by November 1st of this year.

10 MR. EVANS: You might also mention, Ton, that
11 from a security point of view there is some question as to
12 whether your pat-down searches will advise you very much.

13 MR. ALLEN: Sure.

14 MR. EVANS: And that is one of the things that we
15 are looking at, is the lack of effectiveness of that and
16 whether there aren't more effective measures that can be
17 taken.

18 MR. MARK: The airports almost do a pat-down search.

19 MR. EVANS: Only if they have gotten an indication
20 from detection equipment, such as a metal detector, in that
21 particular case.

22 SPEAKER: That is in this country. Get out of this
23 country and -- --

24 (Simultaneous conversation.)

25 MR. ALLEN: In other areas we have now underway in

1 draft form changes to Appendix B of Part 73, which would have
2 the effect of creating a regulatory base to allow us, or
3 through the licensees, to more closely verify the applications
4 submitted by prospective guard force personnel. That is now
5 underway and is a Standards Development and NMSS co-effort.

6 MR. SIESS: Have you got an idea now as to how good
7 guard forces are? Has it changed in, say the last year or so?

8 MR. ALLEN: I would say that with the advent of the
9 Appendix B criteria that there is probably an improvement in
10 the overall level of guard forces, yes, sir.

11 MR. SIESS: Do you know how many plants run their
12 own guard force and how many contract it out?

13 MR. ALLEN: I don't have those figures available to
14 me right now. I would guess maybe 50-50, Dave, would you
15 say, proprietary?

16 MR. MATTHEWS: I can't say. The Office of --
17 Enforcement representative here might be able to answer that.
18 They monitor those things.

19 MR. SIESS: Have you gotten a feel for which is better?

20 MR. MATTHEWS: I think you would probably find a
21 variability among guard forces regardless of whether they are
22 proprietary or nonproprietary that would be of the same order
23 of magnitude.

24 In other words, there are some very good proprietary
25 forces and some very questionable in terms of their turnover

1 rate and efficiency, in those terms questionable guard forces
2 on a comparative basis, that are proprietary, and in the same
3 vein contract guard forces vary over the -- -- as well.

4 Appendix B is basically a group of criteria in
5 training requirements that are in the process of being
6 implemented. There has been some attempt to standardize at
7 least the qualifications of the guards and their training.

8 The licensees were required to submit plans, and those
9 plans are all in for the operating reactors at this point in
10 time which basically outline each of the major functional
11 areas that a guard is expected to perform in. And then a
12 person assigned in that functional area must be shown to have
13 met a certain amount of qualifications, a certain number of
14 qualifications, and must also have been shown to have been
15 trained specifically for those duties.

16 Now that is a long process to make, with respect
17 to turnover in existing guard forces (inaudible) on the force
18 now and get them into duties that they are qualified for as
19 opposed to having general duties. We expect that whole process
20 to take maybe two years before there will finally be a complete
21 implementation of what was intended in that part of the
22 regulation.

23 MR. SIESS: Are there any initial qualifications for
24 guards, or is it all in terms of training?

25 MR. MATTHEWS: No, there are initial qualifications.

6

1 They reside primarily in the area of physical qualifications.

2 MR. SIESS: Not mental or --

3 MR. MATTHEWS: There are no exclusive mental
4 qualifications per se, except that the licensee must ensure that
5 the guard before he is put on duty is subjected to psychological
6 evaluation by a licensed psychologist or trained physician.

7 Whether that indicates any great predictive
8 capabilities on mental stability I don't think it claims. But
9 of course, as you might imagine, that really limits as to what
10 we can do in that regard.

11 MR. ALLEN: Okay, if we can I will go ahead and
12 proceed. What we are trying to do here is to describe some
13 envisioned amendments to 7355, and we are going to discuss
14 this within the context of what guidance is now and will be
15 provided to the licensees and to the staff to help with the
16 implementation of these things. We see beyond the verification
17 of guard force applicant data that the insider protection
18 problem has emerged here in the regulatory area, and over the
19 next couple of years we see possibilities in that area of
20 preemployment screening.

21 As a matter of fact on Tuesday the Commission gave
22 the go-ahead to further examine that area, particularly for
23 power reactors, and they have already decided to go ahead with
24 a rule in the fuel cycle area on that.

25 Also, behavioral observation after the fact, after the

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

7
1 employment has taken place, the use of work rules, which is
2 a new technology that we are examining now on functional zoning,
3 area zoning of the facility, perhaps built along the lines of
4 the safety trains in the case of the power reactor we are
5 examining right now.

6 We have a study going on in that area.

7 Compartmentalization shows up as a potential technique,
8 if it can be handled simply enough to accommodate normal
9 activities. As you have seen, there are studies going on now
10 that will feed into the regulatory process in that area, and
11 we remain open to other techniques that may come along that
12 will help us with the insider problem.

13 We see that there will be changes in the immediate
14 future.

15 The core of the issue that we hope to touch on here
16 is some of the problems we have in regulatory guidance, and
17 that is the documents that are available to the licensees and
18 to the staff in order to help them implement the requirements.

19 We will see here that much of the technical guidance
20 that is now in place for power reactors specifically is
21 obsolete based on the fact that 7355 was issued in February of
22 1977.

23 We will also see that many technical topics are not
24 now addressed and that the guidance materials that are there
25 now to a large extent do not address themselves to continuing

1 compliance in dealing with procedural matters rather than
2 with capital expenditure types of equipment and so forth.

3 Moving on to the next slide, we are going to elaborate
4 a little bit on the obsolescence of some of the materials. This
5 is a sampling of some of the reg guides that are now available
6 for licensees to use in the reactor area. And you can see that
7 there is a problem with obsolescence in their dates as opposed
8 to the date of 7355.

9 You will notice a couple of guides there that have
10 been revised for the purpose of the fuel cycle facility upgrade
11 rule, but which have not been rescreened to provide applicability
12 to power reactors specifically.

13 MR. SIESS: The five reg guides are what category?

14 MR. ALLEN: That is plant protection, I think is the
15 category that they fall into, plant and facility protection.

16 On the next slide we have listed some topics that
17 just some of them, of a list of topics that are not now
18 adequately addressed in guidance. You can see the vital
19 area access requirements are not sufficiently addressed now,
20 and it is somewhat understandable in that new requirements are
21 coming down the pike and it is difficult for these guidance
22 documents to anticipate the regulatory changes before they take
23 place.

24 The same is true of preemployment screening, or the
25 clearance issue, which is now coming into focus for us. The

1 work rule, compartmentalization, also emergency power systems
2 for security equipment in particular. And I might mention,
3 a standard format and content guide. That is the mechanism
4 we use to tell licensees what to submit in their security
5 plans. We have a draft document that has been used in the past
6 by NRR but has never achieved formal status, and that document
7 would naturally have to be updated to accommodate changes in
8 the rules, and that hasn't happened yet.

9
10 MR. EVANS: Tom, you might mention that part of the
11 reason for this review is as previously discussed, transfer
12 of the responsibility to safeguards from NRR to NMSS. This has
13 led us to do a fairly detailed review of what was in existence
14 and what we felt needed to be done in order to assure adequate
15 safeguards in the future.

16 I believe that the question was asked, that they do
17 have the technical lead in this area, and this really is an
18 example of some of the technical things that we are looking
19 at now that we have that lead in NMSS.

20 MR. ALLEN: That is true.

21 MR. SIESS: What comes under the heading of
22 compartmentalization techniques, with emphasis on the techniques?

23 MR. ALLEN: That may be a poor choice of words. It
24 is addressing ways in which compartmentalization could be
25 carried out and expressed in the form of guidance material, and
I guess it would describe -- the descriptions that would be

1 offered there would concern themselves with the types of areas
2 that could be compartmentalized and also address perhaps the
3 barrier types.

4 MR. SIESS: Well, the basic approach would be first
5 to develop criteria?

6 MR. ALLEN: That is correct.

7 MR. SIESS: And then second, as designs are developed
8 to develop some basis for saying these solutions are
9 acceptable. And that used to be what reg guides did.

10 MR. ALLEN: That is still the case.

11 MR. SIESS: And do the criteria exist or does that --

12 MR. EVANS: There is a contract that is being let
13 for this beginning of Fiscal Year 81 that is tackling that
14 exact problem. The first task in it is to define those
15 criteria, which once the criteria is defined we will be able to
16 move forward as you say into the specific regulatory guidance
17 on alternatives to be used.

18 MR. SIESS: Now in connection with that first item,
19 what Mr. Michelson said this morning I think is very appropriate.
20 I think there has been a tendency to define vital areas as
21 those related to systems related to safety, or safety-related
22 systems or systems important to safety. There is various
23 language in the general design criteria.

24 Some of the things that are coming out of the post-
25 Three Mile Island studies suggest that there may be a gradation

11
1 of safety-related systems. Now whether that means there is a
2 gradation of vital areas I don't know.

3 I find it difficult to grade vital areas, but it may
4 extend the vital area concept quite a bit.

5 MR. EVANS: From a safeguards point of view that may
6 also be the case. Right now there is a very large effort going
7 on to look at all the existing sites that Mr. Matthews might
8 can address some detail. But one of the things that we are
9 finding is that in some areas it takes people having access
10 to several vital areas to be able to sabotage the facility to
11 get a release, whereas in other cases only one, and therefore,
12 you would have a gradation from safeguards point of view as
13 well.

14 MR. ALLEN: I think that the bottomline of what we
15 are characterizing here is that there are some problems in
16 providing a comprehensive set of regulatory guidance in the
17 reactor area, and a similar situation existed in the fuel
18 cycle area with the promulgation of the physical protection
19 upgrade rule about two years ago.

20 What we will do here is to look at how a similar
21 situation was handled in that case, and it turns out that
22 what we have done is to compile a package of guidance for
23 fuel cycle facilities into an upgrade rule guidance compendium.
24 And it is clear that a similar type of effort might be worthwhile
25 in the reactor area.

1 I would mention that prior to the transfer of
2 safeguards functions from NRR over to NMSS Mr. Denton requested
3 that a similar package to the upgrade rule guidance compendium
4 be put together specifically for that purpose, to provide better
5 adequate guidance in the reactor area.

6 The upgrade rule guidance compendium as we show here
7 contained, or does contain a set of newly developed technical
8 guides. You can see that the topics that are addressed there
9 are more germane to the theft situation which exists at fuel
10 cycle facilities.

11 Also within the upgrade rule guidance compendium there
12 were implementation documents that were used specifically for
13 allowing licensees to go through an orderly design process in
14 meeting that new upgrade rule.

15 There were documents that explicitly laid out the
16 staff's intent in certain parts of the regulation. There was
17 also a standard format and content guide included in that
18 package to help with the development of security plans.

19 I have got a couple of these volumes here today. You
20 can see that they are quite voluminous. And I would note in
21 the last bullet there that we included a bibliography of
22 non-NRC technical guidance, which has been included in this
23 package in microfiche form, which had about 200 other technical,
24 referenceable technical documents to help the licensees through
25 that better protection upgrade rule implementation.

1 MR. SIESS: I didn't get those last words.

2 MR. ALLEN: Okay. As an additional aid to the fuel
3 cycle industry in implementing the physical protection upgrade
4 rule this package was put together. And we included a set
5 of non-NRC generated technical documents that were referenced
6 within the rest of the material. They included some mil spec
7 materials where they were applicable, some DOE handbooks
8 on entry control, that sort of thing that were included in here,
9 that were of value and could be referenced elsewhere as vital
10 documents to help the licensees through that process.

11 MR. SIESS: Does that include, consistent with
12 endorsement by NRC? If an applicant says I am going to do what
13 one of these things says --

14 MR. ALLEN: No. In the beginning of that particular
15 bibliography section there was a caveat, and then there is a
16 caveat that explains that while much of that technical information
17 is of value that some of it would not be applicable and would
18 not necessarily correspond to NRC's policy.

19 A good example of this, I think, is in some of the
20 specifications that are included in there on locks, they happen
21 to be military specifications, there is a requirement that
22 keys be stamped "U. S. Government," that sort of thing, are
23 clearly nonapplicable.

24 Elsewhere within the document we make numerous
25 references to portions of the data base that is included in that

1 bibliography that are referenceable and are considered
2 acceptable by the staff.

3 So we did do a culling job on that.

4 MR. EVANS: In addition, I might add that we established
5 a group that was available to the licensees, that if they had
6 any question about whether one of these technical specifications
7 was irrelevant to the upgrade rule they could call and we could
8 give them the answer.

9 MR. ALLEN: So what we have is a situation where for
10 a relatively small number of facilities a rather exhaustive
11 job was done in providing regulatory guidance, that being the
12 fuel cycle area. And what we see is that in the power reactor
13 area we can pick up quite a bit from that original process
14 because there are some applicable portions of that work and
15 add to that those aspects of power reactor physical security
16 guidance that are now lacking and provide a similar set of
17 guidance materials for the power reactor licensees.

18 What we have on this slide is a listing of some of
19 the technical guides that we would envision would have to be
20 developed in order to do an adequate job of that. These guides
21 would be developed in a cooperative NMSS and SD project.

22 You can see that the areas that we have regulatory
23 changes coming up in and in areas where we have inadequate
24 existing guidance are the ones that are going to get the most
25 intensive coverage here.

1 You also see that a standard format and content guide
2 in the implementation area and what we call an intent and scope
3 guide, which is a way that we package up statements of staff
4 intent for individual regulatory provisions would also be
5 included.

6 Within the NMSS funding that would be dedicated to
7 this, we plan now to spend about 140 K in FY 81 and 200 K in
8 FY 82. These monies would be used in addition to SD monies
9 that would be dedicated to this. I think that in a previous
10 presentation we saw about a 100 K of their money will be going
11 into this area.

12 MR. SIESS: These monies are included in that list
13 we had earlier?

14 MR. ALLEN: These are --

15 SPEAKER: Yes.

16 MR. ALLEN: They are for NMSS. Yes, they are.

17 The schedule that we anticipate now, given the
18 regulatory changes that are coming up in our manpower
19 is that we would be able to start on this in October of this
20 year, start to get early guidance materials by the first
21 couple of months of Calendar Year '81, and these guidance
22 pieces, documents and so forth would continue to be produced
23 through mid-1982.

24 That pretty much concludes what we have.
25

16
1 MR. SIESS: I have got a question. I am not quite
2 sure it goes here, but since Carl Michelson is back and you at
3 with NMSS?

4 MR. ALLEN: That is right.

5 MR. SIESS: As far as power reactors go, I think we
6 have had only one proven identified case of successful
7 sabotage, and that was the fuel elements at North Anna?

8 SPEAKER: Ferry.

9 MR. SIESS: Ferry. Okay, right company, wrong
10 plant.

11 As I read licensee event reports, every once in a
12 while I spot one that says the cause was undetermined. It was
13 a valve left open and nobody could find any record that there
14 was any reason to open or close that valve or that anybody
15 was working in the neighborhood and so forth.

16 Does anybody in the organization, including Carl's
17 go up, look at some of those things and do a little detective
18 work to see if there might have been a clumsy attempt at
19 sabotage or just plain vandalism or whatever it might be?

20 I would say I see one of those on an average of --
21 I don't see all the LER's and I guess I see one about once a
22 month. But you could put a question on it. Is this done
23 deliberately?
24

25

Tape 7
NRC ACRS
Salguards
6/26/80
Babineau/
Oatfield

1 MR. ALLEN: And I was prepared to discuss that in light
2 of current events. There is a current events briefing scheduled
3 for later in the day.

4 MR. EVANS: The one other point that might be left here
5 is that in terms of the guard screening area, the Commission
6 has, as of day before yesterday, ordered us to develop a rule
7 along the lines of ANSI 1817 for both screening and behavioral
8 observation of guards at power reactors. In addition, though,
9 we have been asked to do a quick fix to take care of the problem
10 that developed at TMI, where we had a newspaper reporter who
11 ended up on the guard force, and we're working that now. That
12 means that, in effect, we'll have a quick-fix type of rule for
13 the power reactors in that kind of area as well as a long-term
14 solution, which means you'll probably find this guidance stage
15 again over both the quick-fix side and the longer term.

16 DR. SIESS: Well, I've seen a lot about the guards, and
17 I guess all about their training and weapons, et cetera. But
18 what I have heard that bothers me most is that in some instances,
19 I don't know how many, guards are essentially paid the minimum
20 wage or a little bit above it, and I don't know how much access
21 they have to the plant, but I guess if I were looking for somebody
22 in a plant to subvert they'd be the first ones I'd look to.

23 MR. EVANS: One of the reasons for the strengthened
24 vital area access rule is exactly that. In the past there has
25 been a tendency at some of the sites to include almost all

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

JO-2
1 employees to have access to almost all areas. And with this new
2 rule we will be able to change that.

3 DR. SIESS: The guards don't necessarily run the plant,
4 like that guy at Three Mile Island did.

5 MR. MATTHEWS: They don't necessarily, but there are
6 some instances where they may. Many utilities look upon
7 restrictions on guard access in differing ways, as you might
8 expect.

9 DR. SIESS: But, see, if I could subvert a guard, then
10 I could get somebody else in there. If he just was somebody
11 controlling access.

12 MR. MATTHEWS: That's right. It's a big problem.

13 What we have asked is that licensees ensure that the
14 guards are capable of gaining access to vital areas under
15 emergency conditions or in response to a Safeguards incident or
16 alarm.

17 DR. SIESS: You're missing -- the point of my question
18 is, guards are low-paid people: has anybody looked at the possi-
19 bility that an outsider individual or group gets to the guard and
20 through the guard gets to the plant?

21 MR. MATTHEWS: That is an assumed portion of the so-
22 called design basis threat, against which we ensure that the
23 security plans have provisions to --

24 DR. SIESS: If I can subvert one guard, I probably can
25 subvert three just about as easily.

0-3

1 MR. EVANS: Well, of course, one of the things that
2 may happen in addition to them having to just subvert the guards
3 to get the access is they may have to have somebody with them.
4 One of the things we're looking at is whether you need to have,
5 say, a two-man rule to make sure that someone is always observing
6 someone else. So then they'd have to have a conspiracy that gets
7 fairly large.

8 DR. SIESS: Well, the two-man rule is good, but who
9 enforces the two-man rule? Who sees that there are two men?

10 MR. EVANS: Anybody that would be at the facility.
11 That's one of the things where you want to have an education
12 program of your entire employee force.

13 DR. SIESS: You see, if he can -- if he could keep
14 tracing this back up to where you only have to get to one or two
15 people to subvert everything below them, then the system isn't
16 any better than who controls them.

17 MR. EVANS: Well, we've got to make sure that it can't
18 get down to just one or two people. And that's one of the
19 things, that's one of the reasons we're going through this
20 exercise, is because we have that very concern.

21 DR. SIESS: You know, on the insider threat, I was
22 thinking about Three Mile Island, and just as an example, not a
23 hypothesis because there's no evidence to support this whatsoever,
24 but let's assume that the people in the control room did what
25 they did with malevolent intent -- which would be a good, one,

0-4 1 you know, it's probably a better explanation of it than anything
2 else I can think of right now, because I find it difficult to
3 understand why they did the things and all the inquiries have
4 found it difficult to understand why they did some things. But
5 let's assume that they did it with malevolent intent. There was
6 no harm to the public. Are there other things they could have
7 done with malevolent intent that could have led to harm to the
8 public? And how could they have been prevented?

9 See, the control room is a vital area.

10 MR. EVANS: It is.

11 DR. SIESS: And control room operators are subjected to
12 a heck of a lot more screening.

13 MR. EVANS: Mm hm. And a lot more training. And I
14 assume the answer to that --

15 DR. SIESS: I think the number of people involved here
16 eventually would have been so many that the hypothesis would
17 begin to get absurd. But I don't think there's anything that
18 could have prevented a couple of more mistakes or actions from
19 having let a lot of stuff out of containment.

20 I don't know whether you can open a purge valve or not
21 under the circumstances anywhere manually, I mean, from the
22 control room. But there are a lot of scenarios you can kick
23 around. And you've got history behind some of them.

24 CHAIRMAN MARK: Okay.

25 DR. SIESS: Sorry for the digression.

1 CHAIRMAN MARK: You're referring to the fuel cycle
2 guide, which has been in place, I guess, for something like two
3 years?

4 MR. ALLEN: The drafts of the fuel cycle guide were
5 provided to the industry last March. And the final versions
6 will be, printed versions will be, to them within the next
7 couple of weeks.

8 CHAIRMAN MARK: So it isn't absolutely formally in
9 place, although it's effectively in place?

10 MR. ALLEN: It is effectively in place.

11 MR. EVANS: It is being used by them, but it has not
12 been officially published as a final document.

13 CHAIRMAN MARK: And has it been found appropriate to
14 keep revising it right up to the present time in some details?

15 MR. EVANS: Not only that. We've now scheduled that
16 it will be revised on an annual basis, so that there will be a
17 periodic revision.

18 CHAIRMAN MARK: All right. So looking towards that for
19 the formulation of what you have ahead of you later in the year,
20 you'll be looking at a quite current document --

21 MR. EVANS: Yes, sir.

22 CHAIRMAN MARK: -- and changes in one would imply the
23 question, at least, of changes in the others?

24 MR. EVANS: Yes, sir.

25 CHAIRMAN MARK: Now, when you say "guidance needs," I

JO-6 1 seem to see close to a dozen little buttons --

2 MR. ALLEN: Yes, sir.

3 CHAIRMAN MARK: -- bullets here. Does that mean a
4 dozen books the size of one of those?

5 MR. ALLEN: No. This document --

6 CHAIRMAN MARK: Good.

7 MR. EVANS: No, they're all included within.

8 MR. ALLEN: This document contains everything that was
9 packaged together for the fuel cycle area, and it included about
10 20 or so NRC documents of the magnitude of the ones you see
11 listed there. So you're talking about --

12 CHAIRMAN MARK: So what you'll be talking of is a
13 package of about that sort?

14 MR. ALLEN: When you take the newly developed reactor
15 materials and augment them with some of the applicable materials
16 from here, it may be this size, but the magnitude of the effort
17 would be considerably less than this, because of the fact that
18 there are applicable materials from here that can be used in
19 the reactor side, too.

20 DR. SIESS: Who's supposed to read those?

21 MR. ALLEN: The licensees read them with a considerable
22 amount of interest and use them, particularly in the fuel cycle
23 area.

24 MR. EVANS: It's not page for page, and we don't want
25 to give you that impression.

0-7 1 DR. SIESS: No.

2 MR. EVANS: If they've got a particular problem, all of
3 this is referenced to specific components.

4 DR. SIESS: Licensing project managers? Reviewers?

5 MR. ALLEN: Yes. The person at the licensee's
6 facility who is responsible for implementing the NRC's regulation.
7 And in the case of the fuel cycle area you're talking of the up-
8 grade rule, or 7320.45 and -46.

9 DR. SIESS: For power reactors who reviews the security?
10 NMSS men?

11 MR. ALLEN: Yes.

12 DR. SIESS: It's sent over by the licensee project
13 manager to NRR?

14 MR. ALLEN: Right.

15 MR. EVANS: Right.

16 DR. SIESS: And NMSS reviews it?

17 MR. MATTHEWS: That goes to the licensing branches
18 in NMSS.

19 MR. EVANS: And then after we make our determination
20 it goes back to the project manager at the end of the line.

21 MR. MATTHEWS: Much in the way that people in the AEC
22 days, those would be the type of review that operated with
23 regard to the licensing project managers. We make the final
24 determination on the acceptability and they basically implement
25 it in terms of the paper.

DR. SIESS: Except it goes out of one office.

MR. MATTHEWS: Right. They like to maintain total control of the license from that standpoint.

CHAIRMAN MARK: In the past it has been said by research that in the preparation of these guides there were certain studies had to be conducted by them and that they took some part in helping the implementation and experience of the application of the new rule before it was finally put in the hands of I&E, or that research programs were called on in that respect. Does this -- pardon?

MR. MATTHEWS: No, I'm sorry.

CHAIRMAN MARK: I'm wondering if implied here with the imminence of the guide package you're speaking of that sort of requirement of research will have been terminated or is within sight of being finished.

MR. EVANS: There's an example that we could cite right now where research is supporting us in looking at what the effectiveness of some of the alternatives are to pat-down searches, for example. And doing that it actually -- are you all familiar with the "mate" process that was done by SAI? It allows us to do a computer sort of diversion path analysis at fuel cycle facilities. That has been modified to allow us to take a look at what paths there would be for sabotage of a reactor and what kinds of safeguards, procedures, and components could be put along those paths and which would be the most effective as

0-9 1 an alternative, say, to pat-down search. Research is supporting
2 that, doing that work for us.

3 MR. ALLEN: And that work is being done in a time
4 frame that will feed into this short-term development, that
5 particularly one is going to be done by before November.

6 And I'd say that in general we try to use research
7 products a lot in our thinking for regulatory changes.

8 MR. EVANS: Basically, they -- we try to use them to
9 develop a technical basis for which we can then determine the --
10 utilize it as a basis for determining the safeguards level of
11 performance that ought to be achieved.

12 I think a very good example of this is the sabotage of
13 spent fuel casks research that you had mentioned to you earlier
14 today, where they're actually testing a mock miniature cask and
15 seeing how much release we can get when we subject it to ex-
16 plosives. Once that release is determined, we will know what
17 level of safeguards should be put on spent fuel shipments. As
18 you know, we issued an interim rule putting a level of safeguards
19 on them that was really just a best guess. We don't have a good
20 technical basis for what the right level is, and research is
21 developing that technical basis for us. And that's how we try
22 to use them in the regulatory process.

23 CHAIRMAN MARK: But in the physical security of plants,
24 power plants in particular, there would not be a large number of
25 projects --

0-10 1 MR. EVANS: No, sir.

2 CHAIRMAN MARK: -- still having to be entered, anyway,
3 well, on comparing infrared with other kinds of interceptors, for
4 example?

5 MR. EVANS: Not in terms of any near-term regulatory
6 process.

7 CHAIRMAN MARK: True, that can happen.

8 MR. EVANS: I would never want to preempt them from
9 saying that maybe DOD had come up with some new way of doing
10 that kind of interception; we might want to look at it for
11 applicability to reactors and we might ask them to go ahead and
12 do that. But in the near-term the answer to your question is no.

13 CHAIRMAN MARK: With respect to the '82 budget there
14 aren't new items that have to be thought of of this sort?

15 MR. EVANS: Not that I'm aware of.

16 MR. DURST: I'd like to, before I respond to that,
17 preparing to respond to that -- the example that they cited
18 previously about equipments and technical capability, you gave
19 the specific example of infrared, all such preliminary researches
20 almost by gentlemen's agreement go to the DOE bailiwick and they
21 have funds greater than our much more limited monies to evaluate
22 equipment.

23 The second question, the one you just asked, I'll let
24 Gerry Tomlin comment on. I would make the general comment that,
25 as he stated, the aggregation of suggested projects for FY '82

0-11

1 has various ranges of realism. Some of them our people down-
2 stairs want very much. Bud Evans just gave an example. You will
3 notice now in the '82 program the results of the cask penetration
4 research, which are, you know, a very basic part of (WORDS UNIN-
5 TELLIGIBLE). There are in there some others that, you know, are
6 just started or are just about to begin, and, you know, the
7 personality that they develop and the utility of the results
8 will be somewhat dependent upon what the contractors turn out.
9 There are, finally, some things in there that right now are just
10 best guesses. We're talking now about a project which will
11 really get (WORD UNINTELLIGIBLE) formulation about the (WORD
12 UNINTELLIGIBLE) level. And it is, indeed, probable when we
13 bring you a list back next year that one or two of them will
14 fall by the wayside, either because it wasn't a good idea or,
15 secondly, because some other new ideas were generated, either by
16 NMSS or us, that seem more reasonable competitors for the number
17 of dollars we have.

18 CHAIRMAN MARK: I'm thinking that a year ago, or
19 perhaps a year and a half ago, I'm looking forward, there was a
20 fairly large block of stuff which was in progress which was, in
21 fact, associated with the implementation or finalization of the
22 upgrade rules; and that has been, to a considerable extent,
23 worked through. I'm not going to object if a year from now some-
24 one says they've had a better idea and similar work is called for.

25 MR. EVANS: As of now I think you're right, that the

0-12 1 basis in this particular area is pretty much established; there
2 is some work still going on. And once we do have that basis,
3 then the answer is no, there won't be a large number of projects.

4 CHAIRMAN MARK: Well, you don't now foresee a large
5 number.

6 MR. EVANS: We don't. That's right. It's a bit of
7 both.

8 CHAIRMAN MARK: Anything else, Chet?

9 DR. SIESS: No.

10 (Pause)

11 CHAIRMAN MARK: I think that for the whole of items VI
12 and VII, which are the last two that we have not gotten to, we
13 will have to close the meeting. Unless there are things over-
14 looked that we should discuss.

15 What are the grounds?

16 (Pause)

17 The thing which I guess doesn't belong in a closed
18 session: there is under consideration the question should we,
19 shouldn't we, meaning NRC, or NMSS, publish the planned routes
20 for shipments of NMS material. Or spent fuel. Possibly
21 damaging material. We're not -- I guess SNM is mostly DOE.

22 MR. EVANS: Well, we have some SNM, but there's never
23 been any question, to my knowledge, raised about releasing the
24 security information related to routes of SNM.

25 CHAIRMAN MARK: They are not made available?

0-13

1 MR. EVANS: So -- they are not made available and we
2 have not been asked to make them available. And, in fact, there
3 is legislation that is about to come out of Congress and go to
4 the President for signature that will give us specific authority
5 to keep from making them available. So that is not a problem.

6 DR. SIESS: But I think it's just the opposite on
7 spent fuel, isn't it?

8 MR. EVANS: Yes, sir.

9 DR. SIESS: Isn't there a bill in Congress to --

10 MR. EVANS: Yeah, the bill in Congress specifically
11 exempts spent fuel from the point of view of the route and the
12 quantities of shipments, only those two things. Now, I --

13 DR. SIESS: And there's nothing, nothing that says
14 that shippers of toxic chemicals or flammable materials have to
15 publish their routes and schedules.

16 MR. EVANS: That is a very true point.

17 DR. SIESS: I cross the railroad twice a day, and I
18 wished I knew their schedule.

19 MR. EVANS: And it sticks in the craw of a lot of
20 people that that is the case. But we're dealing with emotions
21 here, I think, more than anything else.

22 CHAIRMAN MARK: Now let me clear -- you are going to
23 be asked to publish these schedules?

24 MR. EVANS: No, sir, that's --

25 CHAIRMAN MARK: Or legislated that you should? Or

O-14

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 what?

2 MR. EVANS: What we are, what it appears we will be
3 required to do by legislation is to publish the approved spent
4 fuel routes and the quantities of shipments -- not the schedules
5 -- to the public in general.

6 DR. SIESS: Does the legislation require that you, it
7 says you cannot keep it from the public?

8 MR. EVANS: Those two things.

9 DR. SIESS: But does it say you must publish it?

10 MR. EVANS: It says we must publish it, yes, sir.

11 DR. SIESS: I didn't see that.

12 MR. EVANS: Now --

13 CHAIRMAN MARK: Wait a minute. What is must you
14 publish? When we ship through from this plant to that we will
15 use Highway 13 -- that gets published?

16 MR. EVANS: We either publish beforehand or on FOIA
17 given out for request. I mean, you have to give it out.

18 CHAIRMAN MARK: If something is leaving at five
19 tomorrow afternoon, on a route that is known --

20 DR. SIESS: Well, they don't have to fill an FOIA
21 request unless it's two weeks. So --

22 MR. EVANS: We have -- that's right. And we don't
23 learn about the time that it's going until seven days beforehand.

24 CHAIRMAN MARK: Okay. So the exact timing of a ship-
25 ment --

JO-15

1 MR. EVANS: Is not.

2 CHAIRMAN MARK: -- is not involved here. But the fact
3 that you will be using either Highway 13 or, on rainy days, 17,
4 that kind of thing would be?

5 MR. EVANS: Yes.

6 CHAIRMAN MARK: But you're not tied down to say we will
7 always use just this set of roads?

8 MR. EVANS: No. We are tied down to say that only a
9 certain set of roads have been approved.

10 CHAIRMAN MARK: But you can approve alternate routes.

11 MR. EVANS: And there might be three alternative
12 routes.

13 DR. SIESS: Including secondary routes.

14 MR. EVANS: Whatever routes that --

15 DR. SIESS: Actually, the secondary roads, the ones
16 closest to the point of origin and point of destination, are
17 pretty much fixed anyway, I guess.

18 MR. EVANS: There are usually more than one alternative
19 set of secondary roads that will get you to an interstate.

20 CHAIRMAN MARK: Right. From Green County you could
21 have gone either upriver or down.

22 DR. SIESS: That extends the saboteur.

23 CHAIRMAN MARK: Except that going down you would have
24 hit a railroad overpass the truck wouldn't go through. So you
25 didn't have to publish it.

JO-16

1 (Laughter)

2 MR. EVANS: Now I would like to add a caveat. There's
3 an additional section in this rule that relates not to the
4 release of this information to the public but, rather, to the
5 release of this information to governors' offices. Now, as it
6 relates to the --

7 DR. SIESS: Do you make a real distinction?

8 MR. EVANS: Yes, sir, because the legislation says
9 that the material we give to the governors goes beyond the routes
10 and the numbers of shipments but goes to schedules and security
11 and so on. However, it also says that the governors' offices
12 must protect it as security information if we ask them to.

13 DR. SIESS: But if they're going to use it for any
14 purpose they can't really protect it that well; they'll have to
15 notify a lot of people.

16 MR. EVANS: What they do usually -- and we have worked
17 with the states in this in the past -- is they put out on their
18 police channel, so it stays within the enforcement.

19 DR. SIESS: Which any scanner can pick up.

20 CHAIRMAN MARK: The Harrisburg reporters are listening
21 on that.

22 MR. EVANS: Well, as I understand it, it's a teletype.

23 CHAIRMAN MARK: Oh.

24 MR. EVANS: Not a radio.

25 CHAIRMAN MARK: Not a CB.

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

0-17 1 DR. SIESS: But still, something is hardly secret after
2 it gets past one person.

3 MR. EVANS: That's right. It's a matter of how much
4 do you limit the circle.

5 DR. SIESS: And it's a question of timing.

6 MR. EVANS: Yes, sir.

7 MR. MATTHEWS: The intent was to keep it in official
8 channels, at any rate, with regard to the mandatory release.

9 DR. SIESS: But wouldn't normal practice notify local
10 police of potential shipments that are subject to possible
11 sabotage?

12 MR. MATTHEWS: No, we've never notified --

13 DR. SIESS: You don't, you've never relied on local
14 police protection?

15 MR. MATTHEWS: We do in advance approval of routes, we
16 do often check with the local police to make sure that some
17 route is okay from a construction point of view, from the point
18 of view of safety, bridges will hold the quantity of the ship-
19 ments, and that kind of thing. In terms of telling them the
20 specific time the routes coming through, we have not done that
21 in the past. We have, instead, notified the state police.

22 DR. SIESS: Okay. The state police. And on SNM do you
23 rely on local or state law enforcement officials at all?

24 MR. MATTHEWS: Yes, definitely. SNM transport licensees
25 are required to make contact, not necessarily at the time of each

0-18
1 shipment, but prior some time to making a shipment they are
2 required to ensure that they have a point of telephonic contact
3 with law enforcement agencies every 50 miles along the road.
4 They basically have had to have done, how would you say, liaison
5 with those local law enforcement agencies.

6 Now, we did that liaison, meaning the MRC did that,
7 from an operational standpoint initially with many of the SNM
8 routes. Okay, they are expected to maintain those contacts and
9 ensure the accuracy, let's say, of the numbers of contacts.

10 So there has been prior contact, but there wouldn't
11 necessarily be calls to down the road saying now we are starting.

12 DR. SIESS: Well, now, in terms of, say, a spent fuel
13 shipment, notification of local authorities could have two
14 purposes. One would be for assistance in case of an attack. Or
15 the other would simply be for assistance in the case of an
16 accident. Or on an attack -- the consequences of an attack, not
17 preventing one but --

18 MR. MATTHEWS: Mm hm. Mitigation.

19 DR. SIESS: -- mitigation of consequences. Is it
20 clear which is which? Do the state officials have any idea of
21 how they intend to use this information?

22 MR. EVANS: Some states have planned it better than
23 others. I participated in a meeting with the New York State
24 officials in Albany, where they had in attendance both the state
25 police and the emergency planning offices. And they made a

0-19 1 determination that the state police would be our point of contact
2 and that the state police would give that portion of the informa-
3 tion that was needed by the emergency planners to be prepared to
4 help mitigate the circumstances, would give those to the
5 emergency planning office.

6 Now, other states have not yet had the interest in
7 spent fuel shipments, because they haven't had them like we had
8 in New York with Chalk River Run, and therefore they are not as
9 far along in their planning along those lines. And I'm not sure,
10 but I wouldn't say that all 50 states understand that distinction.
11 But I think the ones that the shipments are presently going
12 through have a pretty good handle on it.

13 DR. SIESS: Now, for SNM you depend on DOE, essentially,
14 for protection, don't you?

15 MR. EVANS: No, sir. We have private shipments.

16 DR. SIESS: But I mean --

17 MR. MATTHEWS: The majority of SNM moving in the
18 country would be --

19 DR. SIESS: DOE protects its own. They don't really
20 depend on local --

21 MR. MATTHEWS: That's right.

22 CHAIRMAN MARK: Do you and DOE follow the same rules
23 in respect to what we're talking of?

24 MR. MATTHEWS: There's a general consistency.

25 MR. EVANS: They are comparable and compatible Not

0-20 1 identical but equivalent levels of protection.

2 CHAIRMAN MARK: Well, if by fiat they were made identi-
3 cal, it wouldn't impose much change in what you do?

4 MR. EVANS: No, the only major difference is that DOE
5 has developed a communications system which we -- our licensees --
6 they don't want to give our licensees access to. But our in-
7 spectors will be equipped with that and they will follow the
8 shipments. So I think we come pretty close.

9 CHAIRMAN MARK: Are there, from your point of view,
10 large concerns over the legislation that's likely to go ahead?

11 MR. EVANS: We would have preferred it to have not
12 required as much release as it did, but we don't think that it
13 is such a significant impact on security that we can't live with
14 it. We will be giving up some amount of assurance by giving out
15 this information, but we feel we can live with it.

16 DR. SIESS: My first impression was one of dismay; and
17 then as I got to thinking about it, I suspect that a real good
18 saboteur or -teurs would not gain an awful more that way than
19 they could gain in other ways. I think they probably would have
20 sources of information and would have researched the thing
21 thoroughly.

22 If somebody just wants to go out and put a blockade
23 across the highway and lie down in the middle of the pavement,
24 that, of course, makes it easier for them to do it. But that's
25 not a threat. That's --

JO-21

300 7TH STREET, S.W., REPORTERS BUILDING, WASHINGTON, D.C. 20024 (202) 554-2345

1 MR. MATTHEWS: Harassment.

2 MR. EVANS: Well, but it really is a matter of sub-
3 jective judgment as to how much assurance of security you give
4 up by publishing this information. And as I say, I think every-
5 body would agree that you give up some amount. But I also think
6 that most of us in the security world would say that it's not so
7 great an amount that we can't live with it.

8 For example, we do not recommend to the Commission that
9 they ask the President to veto the legislation based on that.

10 CHAIRMAN MARK: You gain something, I suppose, in that
11 the local authorities will have a slightly easier access to
12 stuff that you might on occasion want them to have. They will
13 have it all the time, but once in a while you might be glad that
14 they had it.

15 MR. MATTHEWS: We felt that the licensees could carry
16 out that communication without any deterrence.

17 DR. SIESS: Once you start shipping spent fuel again,
18 which we're not doing right now very much, except for a little
19 transfer, there's going to be a -- well, a shipment a week, or
20 two a week, going out of some of these plants.

21 MR. EVANS: We estimate between 300 and 500 shipments
22 a year.

23 DR. SIESS: Well, I was saying of a given plant, to get
24 rid of the stuff they've got in there.

25 MR. EVANS: Right. Some more than that.

1 DR. SIESS: It's going to be going out very frequently.

2 MR. EVANS: One might go every day or twice a day.

3 DR. SIESS: And three months of observation and I can
4 establish the patterns.

5 MR. EVANS: Sure. That's true.

6 DR. SIESS: And I don't have to get it from the --

7 MR. EVANS: And in that particular case, unless they
8 use alternative routes, which they could, then in that particular
9 case you don't gain much from the security of the route. On the
10 other hand, if you have a shipment like --

11 DR. SIESS: If there's any pattern to the alternative
12 routes they haven't gained. But if they do it randomly that's
13 all right.

14 CHAIRMAN MARK: A year or two ago there were large
15 questions up in the air as to whether you'd have to ship the
16 stuff from Long Island by sea to Japan or some place else. What
17 is the status, generally speaking, of getting stuff away from
18 Long Island to where you might need to have it go?

19 MR. EVANS: I'm not totally familiar with it. Do you
20 know how that --

21 CHAIRMAN MARK: Well, if -- it was purely out of idle
22 curiosity. It's not quite relevant to this discussion, I know.

23 MR. EVANS: I believe that Brookhaven has decided that
24 they can live with that problem until DOT comes out with its
25 hazardous materials act, which will preempt local rules in the

0-23
1 area of spent fuel shipments, in which case that problem will
2 go away. The schedule for that is within the next year.

3 CHAIRMAN MARK: And you'd be equally affected by that?

4 MR. EVANS: We will be affected in that they reference
5 our rules, and if a locality goes beyond our rules then their
6 laws could be challenged in court and would probably be struck
7 down based on federal preemption.

8 CHAIRMAN MARK: Anything else on that?

9 Well, I think, then, what we do have is these next
10 items. We'll declare a five-minute break and resume in closed
11 session from then until the finish of the meeting.

NUCLEAR REGULATORY COMMISSION

This is to certify that the attached proceedings before the

in the matter of: ADVISORY COMMITTEE ON REACTOR SAFEGUARDS
SUBCOMMITTEE ON SAFEGUARDS AND SECURITY

Date of Proceeding: June 26, 1980

Docket Number: _____

Place of Proceeding: Washington, D. C.

were held as herein appears, and that this is the original transcript
thereof for the file of the Commission.

Suzanne Babineau

Official Reporter (Typed)

Official Reporter (Signature)

NUCLEAR POWER PLANT DESIGN CONCEPTS
FOR
SABOTAGE PROTECTION

DAVID M. ERICSON, JR.
G. BRUCE VARNADO
SANDIA NATIONAL LABORATORIES

OBJECTIVES

- ESTIMATE THE POTENTIAL VALUE OF PLANT DESIGN AND DAMAGE CONTROL MEASURES IN PROVIDING PROTECTION AGAINST SABOTAGE AT LWR PLANTS
- ESTABLISH THE IMPACT OF SUCH MEASURES ON PLANT COSTS, OPERATIONS, AND SAFETY

DESIGN OBJECTIVES FOR RISK REDUCTION

- DECREASE THE NUMBER OF SEQUENCES WHICH COULD CAUSE RELEASE
- INCREASE THE NUMBER OF INDIVIDUAL ACTIONS REQUIRED TO COMPLETE A SABOTAGE SEQUENCE
- REDUCE THE PROBABILITY OF SUCCESS IN SABOTAGE SEQUENCES
- REDUCE THE CONSEQUENCES OF COMPLETED SABOTAGE SEQUENCES

EVALUATION CRITERIA

- VALUE MEASURES

REDUCTION IN NUMBER OF TYPE 1 VITAL AREAS

REDUCTION IN NUMBER OF UNPROTECTABLE TARGETS

INCREASE DIFFICULTY OF MOVEMENT FOR ADVERSARY

PROBABILITY OF SEQUENCE INTERRUPTION/NEUTRALIZATION

CONTROL OF INSIDER ACTIVITIES

- IMPACT MEASURES

INCREMENTAL CHANGES IN COSTS (CAPITAL AND OPERATING)

EFFECT ON SAFETY

EFFECTS ON OPERATIONS

OPERATOR ATTITUDE/PERFORMANCE

MAINTAINABILITY

DESIGN STUDY TECHNICAL SUPPORT GROUP

- REACTOR VENDORS, UTILITIES AND ARCHITECT-ENGINEERS
- REVIEW AND EVALUATE DESIGN OPTIONS AND DAMAGE CONTROL MEASURES
- PROVIDE DATA AND TECHNICAL ANALYSIS
- PROVIDE ADVICE ON OPERATIONAL IMPACTS

TECHNICAL SUPPORT GROUP PARTICIPANTS

BASELINE PLANT SELECTION AND CHARACTERIZATION

- STANDARDIZED NUCLEAR UNIT POWER PLANT SYSTEM (SNUPPS)
 - SYSTEM DESCRIPTIONS
 - SABOTAGE FAULT TREE ANALYSIS
 - VITAL AREA ANALYSIS
 - PLANT LAYOUT DIGITIZATION

BASELINE PLANT (SNUPPS) PHYSICAL LAYOUT

SNUPPS DIGITIZED LAYOUT - LEVEL 2

PLANT DESIGN OPTIONS

- IDENTIFY PRACTICABLE ALTERNATIVES
- DOCUMENT IN CONSISTENT FASHION
 - SELECTIONS BASED ON PLANT FUNCTIONS TO BE PRESERVED
 - FOUR CATEGORIES BASED ON KIND OF DESIGN OPTION
- DEVELOP OPTION TO THE POINT IT CAN BE EVALUATED

EXAMPLES OF DESIGN ALTERNATIVES

- HARDENING CRITICAL SYSTEMS
 - HARDENED CONTAINMENT BUILDING
 - HARDENED ULTIMATE HEAT SINK
 - HARDENED ENCLOSURE FOR MAKEUP WATER TANKS

- LAYOUT MODIFICATIONS
 - SEPARATION OF CONTAINMENT PENETRATIONS FOR REDUNDANT PROTECTION SYSTEMS
 - SEPARATION OF POWER CABLES IN UNDERGROUND GALLERIES
 - ALTERNATE CONTROL ROOM ARRANGEMENTS
 - ECCS ACTIVE COMPONENTS WITHIN CONTAINMENT (ANNULUS)

EXAMPLE OF DESIGN ALTERNATIVES

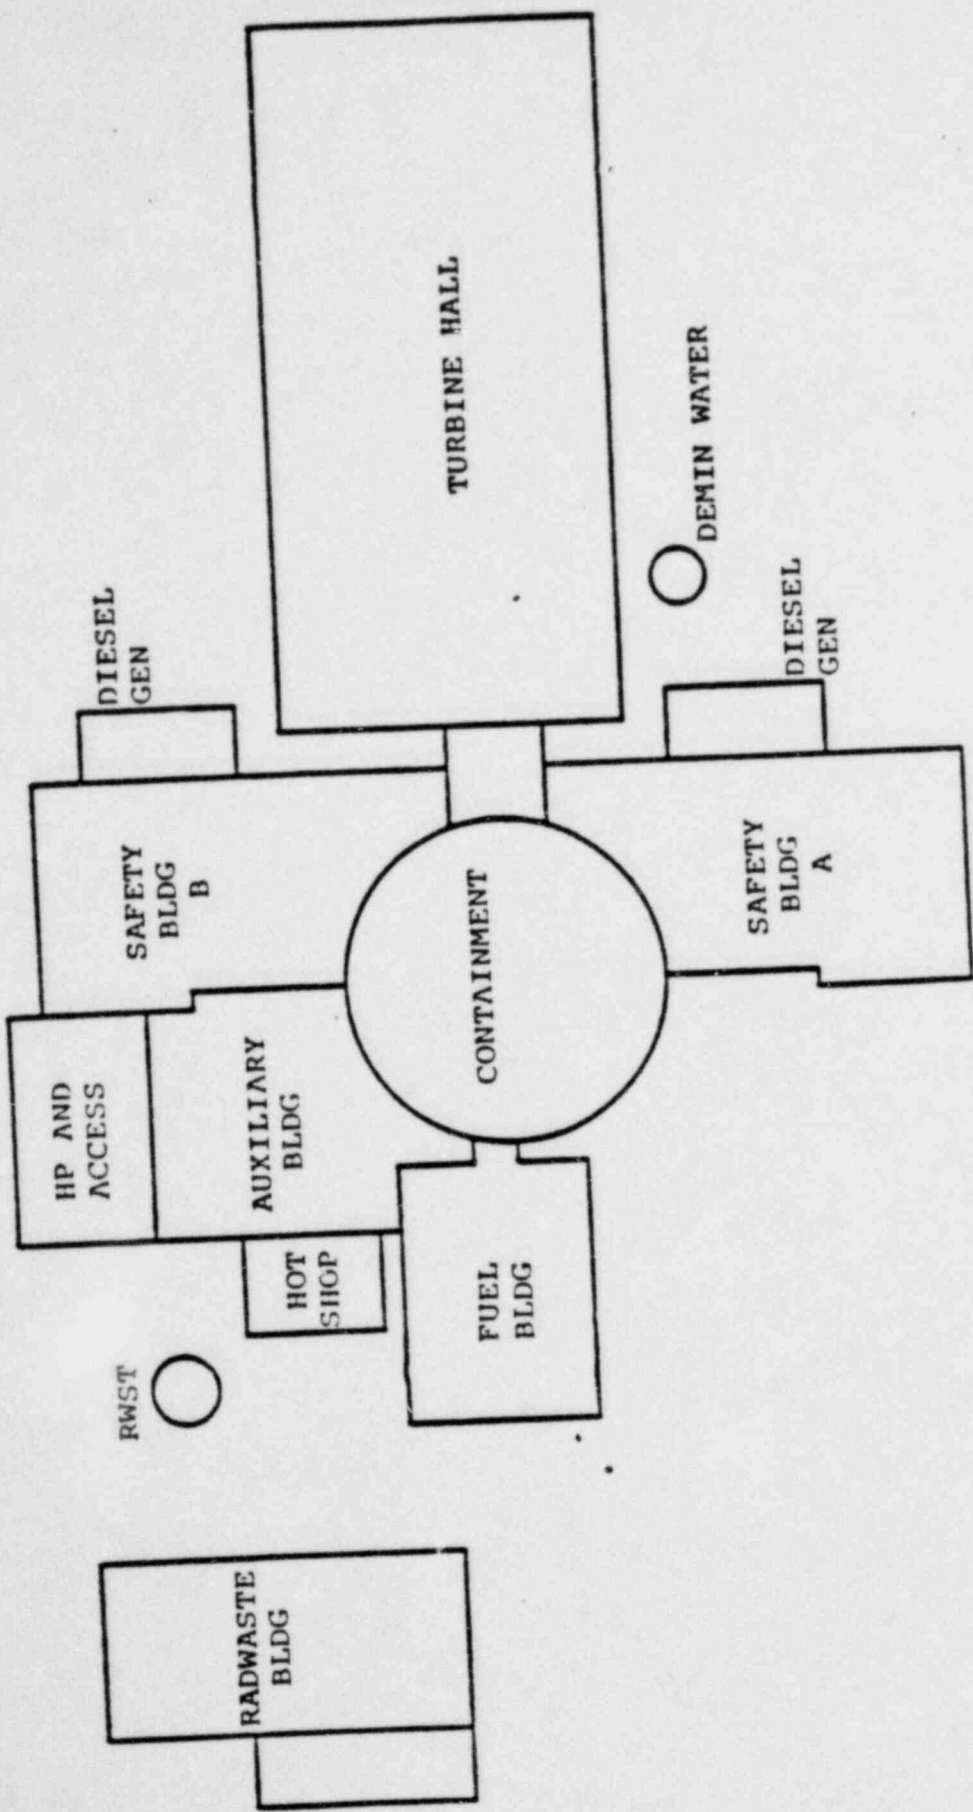

- SYSTEM CHANGES
 - ISOLATION OF LP SYSTEMS CONNECTED TO REACTOR COOLANT PRESSURE BOUNDARY
 - ALTERNATE CONTAINMENT CONCEPTS
 - TURBINE RUNBACK
- ADDITIONAL SYSTEMS
 - INDEPENDENT SAFE SHUTDOWN DECAY HEAT REMOVAL SYSTEM
 - ADDITIONAL INDEPENDENT, DIVERSE SCRAM SYSTEM

ALTERNATIVES SELECTED FOR CONCEPTUAL DESIGN

- HARDENED ENCLOSURES FOR MAKEUP WATER TANKS
- SEPARATION OF CONTAINMENT PENETRATIONS FOR REDUNDANT TRAINS OF SAFETY EQUIPMENT
- PHYSICALLY SEPARATED AND PROTECTED REDUNDANT TRAINS OF SAFETY EQUIPMENT
- HARDENED DECAY HEAT REMOVAL SYSTEM
- ISOLATION OF LOW-PRESSURE SYSTEMS CONNECTED TO THE REACTOR COOLANT PRESSURE BOUNDARY
- DESIGN CHANGES TO FACILITATE DAMAGE CONTROL

ALTERNATE PLANT CONFIGURATIONS

- BASELINE + HARDENED ENCLOSURES FOR MAKEUP WATER TANKS
- PHYSICALLY SEPARATED AND PROTECTED REDUNDANT TRAINS OF SAFETY EQUIPMENT (INCLUDES SEPARATION OF CONTAINMENT PENETRATIONS)
- BASELINE + HARDENED DECAY HEAT REMOVAL SYSTEM

MODIFIED PLANT PHYSICAL LAYOUT

41

BASELINE PLANT PLUS HARDENED DIIRS PHYSICAL LAYOUT

15

EVALUATION OF PRELIMINARY REFERENCE DESIGNS

- VALUE - SAFEGUARDS EFFECTIVENESS OR INCREASED RESISTANCE TO SABOTAGE
- VALUE ANALYSIS TOOLS - EXTERNAL THREAT - SAFE/VAA/ENGINEERING JUDGMENT
INTERNAL THREAT - SUBJECTIVE ENGINEERING JUDGMENT
- IMPACTS - COSTS
MANPOWER REQUIREMENTS
OPERATIONAL CONSTRAINTS
SAFETY
- IMPACT ANALYSIS TOOLS - COST - ESTIMATES FROM DESIGN DRAWINGS

MANPOWER REQUIREMENTS
OPERATIONAL CONSTRAINTS
SAFETY

ENGINEERING
ANALYSIS

VITAL AREA ANALYSIS OF BASELINE AND ALTERNATIVES

	NUMBER OF VITAL AREAS		NUMBER OF AREA COMBINATIONS
	I	II	
BASELINE	5	37	56
BASELINE + HARDENED ENCLOSURES	5	37	56
PHYSICALLY SEPARATED AND PROTECTED	4	39	292
BASELINE + HARDENED DHRS	3	40	56

SAFEGUARDS EFFECTIVENESS - INSIDER CONSIDERATIONS

- BASELINE
 - COMPARTMENTALIZED
 - MULTIPLE ROUTES
 - OPERATOR ACCESS - BOTH TRAINS SIMULTANEOUSLY
 - ADMINISTRATIVE CONTROLS AT COMPARTMENT LEVEL
- PHYSICALLY SEPARATED
 - SEPARATE TRAINS WITH SINGLE ACCESS
 - COMPARTMENTALIZED WITHIN TRAINS
 - WELL-DEFINED ACCESS ROUTES
 - SEPARATES OPERATING AND EMERGENCY EQUIPMENT
 - OPERATOR ACCESS - ONE TRAIN AT A TIME
 - ADMINISTRATIVE CONTROLS ON TWO BUILDINGS
- BASELINE + HDIIRS
 - COMPARTMENTALIZED
 - EXTRA REDUNDANCY FOR TRANSIENT EVENTS
 - WELL-DEFINED ACCESS ROUTES TO DIIRS
 - ADMINISTRATIVE CONTROLS ON ONE ISOLATED BUILDING

IMPACTS OF DESIGN ALTERNATIVES

- BASELINE NO ACTUAL COST DATA
 62 OPERATORS/TECHNICIANS
 OPERATIONS/MAINTENANCE ACCEPTABLE
 SAFETY ACCEPTABLE

- BASELINE + COST INCREASE \$0.5 - 1.5 MILLION
 ENCLOSURES NO CHANGE OPERATIONS/MAINTENANCE/
 SAFETY

IMPACTS OF DESIGN ALTERNATIVES

- PHYSICALLY SEPARATED
 - COST INCREASE \$16 MILLION
 - POSSIBLE INCREASE IN MANPOWER
 - OPERATIONS - ROUNDS LONGER
 - MAINTENANCE - TIMES LONGER DUE TO ACCESS
 - EQUIPMENT MOVEMENT MORE DIFFICULT
 - SAFETY - ADDITIONAL HIPI REDUCES RELIANCE ON OPERATING SYSTEMS
 - SEPARATE SHUTDOWN PANELS AFFECTS CONTROL LOGIC
 - PERSONNEL - TWO MAJOR PLANT AREAS WITH STRICT ACCESS CONTROLS
 - CONTROLS MAY AFFECT ATTITUDES

IMPACTS OF DESIGN ALTERNATIVES

- BASELINE + HDIIRS COST INCREASE \$9 MILLION
POSSIBLE INCREASE IN MANPOWER
OPERATIONS/MAINTENANCE - MODEST INCREASE WITH
ADDED SYSTEMS
SAFETY - ADDED REDUNDANCY FOR TRANSIENTS
PERSONNEL - ONE AREA WITH STRICT ACCESS CONTROL
LESS REACTION TO LIMITED CONTROLS

IMPACTS OF DESIGN ALTERNATIVES

- PHYSICALLY
SEPARATED

COST INCREASE \$16 MILLION

POSSIBLE INCREASE IN MANPOWER

OPERATIONS - ROUNDS LONGER

MAINTENANCE - TIMES LONGER DUE TO ACCESS

EQUIPMENT MOVEMENT MORE DIFFICULT

SAFETY - ADDITIONAL HIPI REDUCES RELIANCE ON
OPERATING SYSTEMS

SEPARATE SHUTDOWN PANELS AFFECTS
CONTROL LOGIC

PERSONNEL - TWO MAJOR PLANT AREAS WITH STRICT
ACCESS CONTROLS

CONTROLS MAY AFFECT ATTITUDES

IMPACTS OF DESIGN ALTERNATIVES

- BASELINE + HDIIRS COST INCREASE \$9 MILLION
POSSIBLE INCREASE IN MANPOWER
OPERATIONS/MAINTENANCE - MODEST INCREASE WITH
ADDED SYSTEMS
SAFETY - ADDED REDUNDANCY FOR TRANSIENTS
PERSONNEL - ONE AREA WITH STRICT ACCESS CONTROL
LESS REACTION TO LIMITED CONTROLS

CONCLUSIONS

- STRUCTURAL DESIGN CHANGES ALONE DO NOT APPEAR TO PROVIDE SIGNIFICANT ADDITIONAL PROTECTION
- DESIGN CHANGES CAN FACILITATE IMPLEMENTATION OF PHYSICAL PROTECTION
- FOR PWRs HARDENED DECAY HEAT REMOVAL SYSTEMS APPEAR PROMISING
- DAMAGE CONTROL USING INSTALLED SYSTEMS MAY HAVE SOME POTENTIAL FOR COUNTERING SABOTAGE (OR ACCIDENT)

RECOMMENDATIONS

- PHASE II SHOULD EXTEND PRELIMINARY ANALYSES RATHER THAN PURSUE DETAILED DESIGNS
- FURTHER DEVELOPMENT OF A HARDENED DECAY HEAT REMOVAL SYSTEM SHOULD BE INCLUDED IN THE ASSESSMENT OF ALTERNATE LWR SHUTDOWN HEAT REMOVAL CONCEPTS PROGRAM
- ADDITIONAL STUDIES TO EXAMINE INFLUENCE OF DESIGN ON INSIDER CONTROL SHOULD BE UNDERTAKEN
- THE POTENTIAL OF OPERATOR ACTIONS FOR COUNTERING SABOTAGE SHOULD BE PURSUED FURTHER
- A MORE DETAILED ASSESSMENT OF DESIGN MODIFICATIONS FOR EXISTING PLANTS SHOULD BE UNDERTAKEN

GUIDANCE FOR SAFEGUARDS AT POWER REACTORS

10 CFR 73.55 - AMENDMENTS UPCOMING

- VITAL AREA ACCESS
- PAT-DOWN SEARCH REPLACEMENT MEASURES
