Dear Sir:

Reading the Tuesday, June 3rd issue of the Christian Science Monitor, I noted the article about venting the Krypton gas from Three Mile Island.

Seems to me that the gas could be released into very large balloons & helium or another gas added to make it raise above the atmosphere. Then it would destroy itself or could be exploded remotely.

Balloons could be monitored by radar or planes. FAA could provide a clear area for the flights.

Sincerely,

Phillip M. Greer
