A. EFFLUENT AND WASTE DISPOSAL SEMIANNUAL REPORT

This section contains a summary of the liquid and gaseous release limits; a listing of the maximum permissible concentrations of the isotopes released; a summary of batch and abnormal release data; a summary of total liquid and gaseous releases; listings of isotopes released classified by pathway, gaseous or liquid, and type, continuous or batch; and a summary of solid radioactive waste and irradiated fuel shipments. The data presented in this section represent all releases during the period January 1, 1980 through June 30, 1980.

REGULATORY LIMITS

Gaseous Iodine Release Limit

1. ETS 2.4.5.b.(5), Iodine 131 limit of 2.0 Ci during any calendar year.
2. ETS 2.4.5.b.(6), Iodine 131 limit of 4.0 Ci during any consecutive twelve month period.

Particulate Release Limit (For Nuclides with Half Lives Greater than Eight Days)

1. ETS 2.4.5.a.(2), Instantaneous release rate of 1.24×10^{-6} Ci/Sec.
2. ETS 2.4.5.b.(3), Quarterly average release rate limit of 3.21×10^{-8} Ci/Sec.
3. ETS 2.4.5.b.(4), Twelve month average release rate limit of 1.67×10^{-8} Ci/Sec.

Liquid Effluent Limits (Excluding Tritium and Gases)

1. ETS 2.4.2.a, Instantaneous discharge concentrations less than the maximum permissible concentrations listed in 10 CFR 20, Appendix B, Table II, Column 2.
2. ETS 2.4.2.b, Gross release limit of 10 Ci in a quarter.
3. ETS 2.4.2.c, Gross release limit of 20 Ci in any consecutive twelve month period.

AVERAGE ENERGY

Effluent release limits are not based upon \bar{E} , hence, reporting \bar{E} is not required.

MEASUREMENTS AND APPROXIMATIONS OF TOTAL RADIOACTIVITY

Gaseous Releases

Fission and Activation Gases: Gamma spectrometric analysis of gaseous grab samples define radionuclide distribution at least monthly on monitored gaseous release points. Using the known nuclide distributions and process radiation monitor readings, the actual quantities of gaseous releases are calculated.

Iodines: Weekly composite filter and activated charcoal samples are analyzed by gamma spectroscopy to determine the concentrations of iodine isotopes released from each effluent stream. Monthly composite filters and activated charcoal samples are also analyzed.

Particulates: Weekly composite filter samples are analyzed by gamma spectroscopy to determine the concentrations of particulate isotopes. Monthly composite samples are analyzed for beta and alpha emitting isotopes by counting with a gas flow proportional counter using chemical separation techniques when necessary.

Tritium: Tritium is collected on dry silica gel in monthly composite samples, and counted using liquid scintillation spectroscopy.

Liquid Releases

Fission and Activation Products: Gamma spectrometric analysis of each batch is performed. Monthly composite samples are maintained for continuous and batch releases and the composites are analyzed for specific nuclides as required.

Tritium: Monthly composite samples are distilled and deionized as necessary to remove contamination and counted by liquid scintillation techniques.

Dissolved and Entrained Gases: Gaseous isotopes are determined by gamma spectrometric analysis of each batch. Monthly composite samples are also analyzed for gaseous isotopes.

B. OFFSITE RADIATION DOSES

Offsite radiation doses from gaseous and liquid effluents for the first and second quarters of 1980 are presented in this section. Included are quarterly doses to individuals at locations of maximum actual exposure and quarterly doses to the 50-mile population. Doses are presented separately for batch and continuous releases and for noble gas, gaseous iodine and particulate, and liquid effluents.

Exposure locations are based on the land-use survey presented in the FSAR, effective through Amendment 33, and the annual survey of agriculture production, effective November 15, 1979. Meteorological data used in the analyses are presented in Section C of this report.

Models and assumptions used in performing the dose analyses for the first half of 1980 are presented in Sections 11.2 and 11.3 of the Trojan FSAR. Additional assumptions are given in this section.

C. METEOROLOGICAL DATA

Meteorological data for the first and second quarter 1980 are presented in this section. Included are quarterly joint frequency distributions of ground-level wind and atmospheric stability for batch and continuous releases. Also included are quarterly tables of atmospheric dispersion, deposition and depletion factors that have been calculated from these joint frequency distributions. Meteorological models and assumptions used in performing the analyses are presented in Section 2.3 of the Trojan FSAR.
