## 1 PRESENTERS:

2 JOSE CALVO, Chief, Technical Specifications Branch,  
3 NRR

4 CHRIS L. HOXIE, Technical Specifications Branch, NRR

## 5 PARTICIPANTS:

6 Bob Tjader, NRR/OTSB  
7 Dave Wiggintow, NRR/PDIV  
8 Pat Milano, NRR/OTSB  
9 Jim Miller, NRR/OTSB  
10 Ed Abbott, ABZ, Inc.  
11 Maggalean W. Weston, NRR/OTSB  
12 Sheri Peterson, NRR/OTSB  
13 Mort Rienhart, NRR/OTSB  
14 Chris Kimura, LLNL/OTSB  
15 Warren J. Hall, NUMARC  
16 Jim Andrachek, SRC  
17 James R. Whetseh, Va. Power/North Anna  
18 Joe Hegner, Virginia Power  
19 Jim Lazevnick, NRR/SELB  
20 Millard Wohl, NRR/OTSB  
21 Nanette Gilles, NRR/OTSB  
22 Dan Stenger, Bishop, Cook, Purcell and Reynolds  
23 George Wunder, NRR/PD22  
24 Claudia M. Abbate, NRR/PDIV  
25 Carl S. Schlten, NRR/OTSB

1 PARTICIPANTS: (continued)

2 Carl L. Sossman, Westinghouse

3 James G. Lahti, WTSPS

4 Ed Lozito, Virginia Power

5 Harley Silver, NRR/PD22

6 Leon Engle, NRR/PD22

7 John Cesare, System Energy Resources, Inc.

8 Donald R. Hoffman, Excel Services Corporation

9 Dan Green, Florida Power Corporation

10 Edward B. Tomlinson, NRC/NRR/PDIV

11 Robert J. Giardina, NRC/NRR/OTSB

12 L. L. Kintner, NRC/NRR/DRPR

13 Calvin W. Moon, NRC/NRR/DOEA/OTSB

14 John L. Knox, NRC/NRR/DST/SELB

MR. CALVO: On the record. My name is Jose Calvo. I am the Chief of the Technical Specifications Branch in the Office of Nuclear Reactor Regulations, NRC. The purpose of this meeting is to present the NRC staff view on several important issues concerning technical specifications which have recently been the center of attention in nuclear operating plants.

Examples of such issues are equipment and systems operability, support systems and allowed outage time. A typical electrical power system will be used to illustrate these issues as well others.

The NRC staff presentation will be in two parts. The first part will be a general introduction to include the purpose of the technical specifications, the technical specifications' relation to the safety analysis of the plant, the application of the general design criteria to the tech specs; that is, Appendix A to 10 C.F.R. Part 50. The abbreviation C.F.R. is in the list that was given to you.

Using a functional diagram of an electrical power system, we will discuss the exemptions to the single failure criteria from the tech spec standpoint and we will also illustrate operability support systems.

Richard Emch was going to be the person giving this presentation. He is not here today. He is ill and I will do

1 the best I can to fill his shoes.

2 The second part of the presentation will be given by  
3 Dr. Chris Hoxie and his presentation consists of a detailed  
4 discussion of the support systems and the interaction with the  
5 systems they support.

6 Also, he will have a discussion of the allowable  
7 outage time which will include the results or interviews that  
8 we had, that the staff had with the operator licensing  
9 instructors in the Technical Training Center in Chattanooga,  
10 Tennessee and he will use some conditions and require actions  
11 from a typical power system LCO to illustrate these items.

12 Now we would like to hold questions to the end of the  
13 presentation unless requested by the presenter. We would also  
14 like to give priority to questions of a general nature first.  
15 Questions of a specific nature will be deferred towards the end  
16 of the meeting. Also, we would appreciate it if the persons  
17 asking the questions would identify themselves so we can put  
18 the name on the record.

19 So let me start now with the presentation, the first  
20 part of the presentation, which was going to be given by  
21 Richard Emch.

22 [SLIDE.]

23 MR. CALVO: I guess Richard was very well prepared  
24 and I have to give his presentation and I am going to have to  
25 read some of the things that he was going to say so you are

1 going to have to bear with me. If you have any trouble with my  
2 reading, I will provide that information later to you so that  
3 you can put it in the record.

4 Now I note that most of you know what these things  
5 are but I think if we try to establish a base that from here  
6 that we are going to go back to what Dr. Hoxie is going to say,  
7 I think some of the things I would like to put them in the open  
8 so everybody understands how this whole tech specs was put  
9 together.

10 The fundamental purpose of the technical  
11 specifications is to define and preserve the validity of the  
12 results and conclusions of the design basis accident and we are  
13 going to call those "DBAs" from now on, analysis and the mode  
14 for which they are analyzed. The LCOs to be located in the  
15 technical specifications should meet this fundamental purpose.

16 The criteria used for the technical specifications  
17 improvement program that will identify the limited condition  
18 for operation to maintain plant safety are stated in the  
19 interim Commission policy on technical specifications  
20 improvement. This criteria is closely tied to the design basis  
21 accident safety analysis.

22 The general design criteria, Appendix A to 10 C.F.R.  
23 Part 50 was used as the basis to govern the capability of  
24 component systems and structures taking credit for in the  
25 safety analysis, to perform the intended function when

1 required.

2 Examples of general design criteria that will  
3 illustrate this point and will be used later in connection with  
4 the discussion of the electrical power system's tech specs is  
5 the associated design criteria associated with the fluid system  
6 general design criteria.

7 I would like to read a little excerpt in the  
8 criteria. This is 34 and 35 and has to do with the decay heat  
9 removal systems and it is important to know that because I  
10 think it establishes the purpose of the tech specs and I think  
11 we will understand what operability and supported systems are  
12 and what is the purpose of the systems.

13 It says in there that it is suitable and I am taking  
14 a little part of it, "suitable redundancy in components and  
15 features and suitable interconnections, leak detection and  
16 isolation capabilities shall be provided to assure that for on  
17 site electrical power system operation assuming off site power  
18 is not available, the system safety function can be  
19 accomplished assuming a single failure."

20 What I would like to do now is to put up a slide  
21 which is going to show a typical electric power system diagram  
22 and we can start the discussion from there. You have some  
23 other slides in there that Richard Emch was going to talk about  
24 but I feel that I don't have the dialogue that he was going to  
25 use so I am trying to improvise and give you the essence of

1 what he was trying to convey.

2 [SLIDE.]

3 MR. CALVO: The electric power system is considered  
4 to be the most important support system in a nuclear power  
5 plant. I am trying to use it to illustrate the applicability  
6 for the general design criteria. I want to also illustrate how  
7 we can take exception to the single failure criteria in the  
8 tech specs the space that will be acceptable and we also  
9 illustrate how the support systems and supported system  
10 interact with each other and also illustrate the operability of  
11 the supported systems.

12 Now in a typical limited condition for operation for  
13 the electrical power systems, normally, I guess, there are two  
14 off site power sources and two on site power sources which must  
15 be operable, must be available at all times to meet the general  
16 design criteria.

17 The general design criteria that I mentioned before  
18 that it has to do with the fluid systems, the safety function  
19 must be accomplished for the on site on the off site given that  
20 one of them is not available assuming a single failure. You  
21 must have those two operable, the two off site and the two on  
22 site operable to meet that single failure criteria and meet the  
23 GDC.

24 Now let's assume that we have one on site -- and let  
25 me before I go on just quickly tell you what we have in here.

1 We have a switchyard and a brick and a half configuration and  
2 we see the off site power sources going to transformers which  
3 in essence supply emergency buses, A and B to signify  
4 redundancy and the same thing from the other side.

5 Also in here, we have a diesel generator which is  
6 connected to one of the buses and a redundant counterpart  
7 connected to the other bus. We have loads in here at this  
8 power level, normally it is a 4,160 volts and we have load A1,  
9 load A2, Load A3 and we also have the redundant counterparts in  
10 the B train.

11 As you can see, I am selecting one particular load  
12 here to indicate a motor control center which in turn supports  
13 other loads in here and the same thing for the redundant  
14 counterpart.

15 Now let's assume that we had one source inoperable in  
16 either the off site or the on site and the question that we  
17 asked, that system under those conditions doesn't meet the  
18 general design criteria that I had said before for the fluid  
19 systems. One thing is acceptable.

20 I think it is acceptable because the probability of  
21 occurrence of having a design basis accident at that time is so  
22 small in the allowed outage time is consistent with the  
23 reliability of that system that on the tech specs space we say  
24 it is fine to be under that degraded condition as long as you  
25 fix the equipment or that particular source to the operable

1 status as soon as you can.

2 So the completion time becomes a very significant  
3 piece of information that you must comply with, you must do  
4 what you can so once you quickly restore the equipment, you  
5 want to go back again to establish the two off site sources and  
6 two on site sources so you are still in conformance with the  
7 general design criteria.

8 Now the question that we asked, you will have either  
9 this source or that source out or inoperable at the lowest  
10 power in here is also considered inoperable. The answer is no.  
11 Both sources have to be out of service because these loads in  
12 here are considered enough because it is power in here. The  
13 power coming to those loads, this one doesn't know where it  
14 comes from, whether it comes from the outside or whether it  
15 comes from the diesel generator so it is the power to those  
16 loads.

17 So if you look at the definition of operability, you  
18 find in there that we are talking about electrical power. At  
19 one time there was some concern that we put in there the  
20 electrical power to mean off site and on site, they had to be  
21 available to meet the general design criteria but it is not.  
22 On this particular one, it is power that we are looking into so  
23 it is only if those loads become inoperable, we remove both  
24 this source or that source in there.

25 Now there is a condition in here that suppose we lose

1 off site power and right at that instant in time, there is no  
2 power to this bus. Right for that instant of time with this  
3 coming up to speed to the connection here to provide power to  
4 those in there, are those considered inoperable? No, they are  
5 not considered inoperable because the safety analysis of the  
6 plant accepted the fact that for that short period of time  
7 where these come up to speed normally in the order of ten to 20  
8 seconds, it was analyzed that it was acceptable during that  
9 time delay that if the diesel comes up to speed, the intended  
10 function for those loads to mitigate the consequences with a  
11 loss to off site power of the accident, it will be fine.

12 So under those conditions, our view of it is that  
13 those loads should not be declared inoperable.

14 We talked about resources. Now let's talk about the  
15 loads a little bit. Now again if we happen to have this motor  
16 control center out of service and we happen to have any one of  
17 those presumable loads in here which are supported by the motor  
18 control center out of service, any one of them, and the  
19 question that we asked is, if we had one of those out of  
20 service, this out of service, and we wanted to know would we  
21 again be vulnerable to the single failure criteria and we  
22 happened to have right at that time a design basis accident and  
23 we also postulate a concurrence of a loss of off site power, if  
24 that is the case if we postulate single failure, then we have  
25 lost function, we don't meet the general design criteria.

1           But again in tech spec space we saw that within a  
2 completion time, they are allowed to restore this particular  
3 equipment back to operable status, you are allowed to  
4 postulate, you are not permitted, or we are not considered to  
5 postulate single failure in the redundant counterpart train.

6           The allowable outage time, I will just give you a  
7 little capsule of it because I think Dr. Hoxie will go into  
8 much more detail later with some examples of it and it will be  
9 talking about direct support systems, systems that are directly  
10 tied up to a support system and a system which is indirectly  
11 tied up such as the ventilation systems and things like that  
12 which different considerations must be taken.

13           Let me talk just a little bit on the supporting  
14 systems. The supporting systems in this particular case, you  
15 have a small control center and if we assume that we lost power  
16 to this train A, are those support systems considered  
17 inoperable? Yes. Pursuant to the definition of operability,  
18 if we lose the small control center directly connected to those  
19 there, those systems become inoperable right at the instant of  
20 time.

21           Now also further variations of this, Dr. Hoxie will  
22 present during his presentation. I guess in essence this  
23 summarizes more or less what Richard Emch, a little shorter  
24 than what was envisioned to take, but I guess maybe now we  
25 should get into the details of this thing and I think Dr. Hoxie

1 will bring that to you. Thank you for putting up with me on  
2 this one.

3 [SLIDE.]

4 MR. HOXIE: Good morning. My name is Chris Hoxie and  
5 I am going to be talking about two main things this morning,  
6 the first one is support systems and then the second thing I  
7 will talk about really is completion times and our meanings of  
8 them.

9 [SLIDE.]

10 MR. HOXIE: I want to start on slide two. So that we  
11 are talking the same language, a lot of the regulations, tech  
12 specs that are in existence, they use a big phrase; they say,  
13 "Systems, Subsystems, Trains, Components or Devices" and so  
14 that I don't have to say that long phrase every time that I  
15 mean that, I am just going to call those "Features." Features  
16 for me then is a generic term that means any of those things.  
17 So all through this, I will be talking about support features.

18 [SLIDE.]

19 MR. HOXIE: To give you an overview then of what I am  
20 going to talk about on support systems, basically I am going to  
21 talk about some proposed guidance that we have, five pieces of  
22 it which are labeled here A, B, C, D and E and those five items  
23 are if you have a support feature, how should you go about  
24 finding the completion time of the support feature.

25 Then item B is, what about support features where the

1 support is a little bit more indirect and I will discuss a  
2 little bit what we mean by direct and indirect support, for  
3 those types of support systems how do you find the completion  
4 time for an indirect support system.

5 Item C is what about the required actions? What do  
6 you have to do when a support feature is inoperable? What  
7 required actions do you have to take.

8 Item D is what about support features that are not in  
9 the tech specs and item E are what is it about an inoperable  
10 support feature that does not prevent the supported feature  
11 from performing its safety function.

12 So those five things are what I am going to discuss  
13 now and we will go back then on the next slide to item A to a  
14 discussion of how do you find the completion time of a  
15 supported system.

16 [SLIDE.]

17 MR. HOXIE: Basically the way you do it is laid out  
18 on this slide. The completion time for an inoperable support  
19 feature is simply the minimum of the list that you see there,  
20 it is the minimum of the completion time of supported feature  
21 one, the completion time of supported feature two, ... through  
22 completion time of supported feature N.

23 In other words, you look at all of the various  
24 supported features, you take the shortest one and that becomes  
25 the completion time of the support feature.

1 MR. BERKOW: Chris, could you tell us what you mean  
2 by completion time? I am not familiar with the term.

3 MR. HOXIE: Basically, I use it, do you know what an  
4 allowed outage time is?

5 MR. BERKOW: Yes.

6 MR. HOXIE: Let's say that it is very close to that.  
7 It is the amount of time like in the tech specs, there are LCOs  
8 and then there are action statements or whatever it is called,  
9 required actions. The completion time is the amount of time  
10 that you have to complete the required action.

11 MR. CALVO: If a particular system or component all  
12 of a sudden you wake up one morning or you do a surveillance  
13 and you find it inoperable, you enter a limited condition for  
14 operation, and you say, "Okay, you have a certain amount of  
15 time before you restore this component or system to operable  
16 status." If you don't do that in that amount of time, then you  
17 must have, normally you go to a mode or condition in case you  
18 have an accident there, you are better to mitigate the  
19 consequence of it so you go to a different mode of operation.

20 MR. BERKOW: I just never heard the term, "completion  
21 time."

22 MR. CALVO: That is new. This is a new term that we  
23 have agreed between the owners and the NRC staff as part of the  
24 technical specifications improvement program that we are going  
25 to use that instead of allowable outage time. You can see

1 allowable outage time is a mouth full. Completion time, I  
2 think you can say more easily. By the way, that person who  
3 made the comment was Herb Berkow.

4 [SLIDE.]

5 MR. HOXIE: Let's continue on then with the next  
6 slide. This will probably make it a little bit more clear what  
7 we have. Let me give you an example. One of the large support  
8 systems in nuclear power plants is the electrical power  
9 distribution system that supports a whole bunch of stuff and  
10 suppose you were trying to find the completion time for it.

11 What this first piece of guidance that was on the  
12 previous slide says is that you would look at some of the  
13 various supported features, you would actually look at all of  
14 them and I have just listed a couple here and you might find  
15 that the electrical power distribution system supports an RHR  
16 pump and that these types of pumps typically have a 72-hour AOT  
17 or completion time.

18 Also, supports containment isolation valves, CIVs,  
19 those have like typically a four-hour completion time. The  
20 power distribution system also supports battery chargers and  
21 battery chargers are rather critical to plant operations and so  
22 they have a very short two-hour AOT.

23 The guidance I just gave you, what you would choose  
24 then for the completion time for the electrical power  
25 distribution system would be the minimum of those or two hours.

1 Now you say, "Is this different than the typical guidance we  
2 have today?" I don't think that the content is any different  
3 but if you go and you look in a lot of specs, you will find for  
4 the AOT under the electrical power distribution system, you  
5 won't have two hours. You will find eight hours.

6 It has been assumed by the NRC staff though that if  
7 the electrical power distribution system is inoperable, and the  
8 part of it is that is inoperable supports a battery charger,  
9 that the operator would be smart enough to go and enter the  
10 battery charger spec and find out that he has to shut down in  
11 two hours.

12 You can see then some of the advantage of taking this  
13 new approach is that the real problem is in the electrical  
14 power distribution spec, that is where your inoperability is.  
15 If he would have had two hours there in front of him, he would  
16 know immediately what completion time he had to face.

17 The requirements cascade any way. If the battery  
18 charger is inoperable, it is inoperable and you have to do what  
19 you have to do for an inoperable battery charger. But as much  
20 as possible, we would like for the tech specs to be clear for  
21 the operator, to be operator friendly, to give him the guidance  
22 that he needs right in the spec where the problem is. So that  
23 is sort of the philosophy.

24 Let's go on to the next slide and I will summarize  
25 then some of the reasons why we are doing this.

1           MR. STENGER: Dan Stenger with Bishop, Cook, Purcell  
2 and Reynolds. How are you defining electrical power  
3 inoperability here in this example? Is it loss of both  
4 emergency and normal power or just one?

5           MR. HOXIE: Just one.

6           MR. CALVO: Could you give me the electrical diagram  
7 that I had before? Excuse me for a minute, Chris.

8           [SLIDE.]

9           MR. CALVO: It would be the electrical power. You  
10 see the loss in here, they don't know where the power comes  
11 from whether they are coming from here or coming from there.  
12 There is no meter in here that tells me that I have off site  
13 power or on site power. So it is power in here.

14           So if I lost power, presumably I lost this source and  
15 this source is not capable of being collected. So it is that  
16 loss to power right here. If the distribution system he is  
17 talking about is this one and this is the motor control center  
18 and one of those is the battery chargers, that means that you  
19 had completely lost power in here.

20           If you lose power in this, I don't know what you can  
21 do in here to make that thing operable unless you quickly bring  
22 another diesel or something that connects power in there. But  
23 we are talking about the total loss of power, both sources in  
24 this case.

25           Mr. STENGER: You are talking about loss of both?

1           MR. CALVO: That's right and in that definition, that  
2 gives it away. A lot of people today, as a matter of fact if  
3 you go back and look at some of the old plants and you look at  
4 the procedures for operability, they considered having both and  
5 I think in our opinion, in our view now they are going beyond  
6 what is needed. As a matter of fact, I was looking at a  
7 plan a couple of weeks ago, a procedure for operability and  
8 they were defining electrical power to mean both of them. We  
9 are saying there is no need to have both of them and I will  
10 tell you why.

11           Logically suppose you have an accident, a design  
12 basis accident, concurrent with a loss of off site power, I  
13 have an accident, I lost off site power, around right here, it  
14 is all connected to these buses from one source of power. Are  
15 the loads inoperable? No, they are not inoperable.

16           MR. STENGER: Is there a discrepancy in the  
17 understanding? I thought you said it was just one.

18           MR. HOXIE: I misunderstood your question.

19           MR. STENGER: All right.

20           MR. KINTNER: I am Les Kintner with NRC and I have a  
21 question. Jose, have you been talking about modes one, two and  
22 three as opposed to modes four and five in which there is only  
23 one diesel generator required to be operable?

24           MR. CALVO: Yes, that's true. During the shut down  
25 mode of operation, I think those requirements and I don't know

1 if you have it in some of the tech specs, they are not being  
2 considered right now as part of the tech spec improvement  
3 program. When we say that we would require, we are still  
4 discussing those questions and problems, we would be required  
5 to have at least, we would require one off site and one on site  
6 and also we require one off site in the redundant counterpart.

7 Do you see what we are saying? We are saying that we  
8 like to have the two off site power sources and the reason we  
9 like to have them is because we like to be sure that on the  
10 normal operation, we like to be constantly meet the general  
11 design criteria. But the loads in there, they are not  
12 inoperable by the fact that you lose one source but if you  
13 don't put those sources back into service within a given amount  
14 of time, then you must pick up another mode of operation which  
15 you can be safe.

16 But if you are shut down, you can't pick up any mode  
17 of operation because you are already shut down.

18 MR. KINTNER: Right. So that if only one diesel  
19 generator is required in shut down condition and one off site  
20 power supply and you lose that diesel generator, should there  
21 then be an allowed outage time to get that diesel generator  
22 back on even though you have off site power?

23 MR. CALVO: Sure. It will be an allowable outage  
24 time but the question that you asked, where can you go if you  
25 are already in mode four or five, you can't go any further,

1 right, and what you have to do is do what you can to restore  
2 whatever source due to loss to operable status and in the mean  
3 time, you may want to elect to suspect core alteration  
4 separation because you feel that you are losing that kind of  
5 the security blanket having one source instead of two.

6 MR. KINTNER: I guess my point is that there may be  
7 specific considerations for shut down that don't fit what you  
8 were saying here. In general, operability for power supply  
9 only means the power is there for the system whether it is on  
10 site or off site.

11 MR. CALVO: No. I know what you are saying and  
12 everyone is having trouble with this separating both the  
13 sources from the loads. In both cases that you go mode one,  
14 two and three or modes four and five, you still establish  
15 requirements to the sources, the off site and the on site  
16 sources.

17 The loads don't care whether you are in modes one,  
18 two or three. They want to know whether they have power and  
19 there is no meter there to tell me whether I have off site  
20 power or on site power. As long as you have power, either  
21 modes one, two, three, four or five, you are still operable.  
22 When you lose the power from both sources that is only when you  
23 become inoperable.

24 So in the case of the shut down that you are talking  
25 about, if I am required to have one off site and one on site

1 and I lose one of them, are the loads operable? Yes, they are  
2 still operable and the other train was only required to have  
3 one off site as long as on the off site, I am still operable.  
4 Now if I lost that off site and the diesel is not capable of  
5 performing the function, then it becomes inoperable.

6 I gauge my power available today, it doesn't care  
7 whether you are off or on site. All that they know is that  
8 they have power available. That is, I guess, the philosophy,  
9 the kind of rationale that we used when we put this whole thing  
10 together.

11 MR. KINTNER: Thank you.

12 [SLIDE.]

13 MR. HOXIE: So the philosophy then behind taking the  
14 completion time of a support feature as being the minimum of  
15 all the completion times of the supported features is simply  
16 that we look at it as being an operator aid.

17 It means that the shortest completion time will  
18 indeed appear in the tech spec where the problem is and,  
19 therefore, that the operator doesn't have to search through  
20 multiple LCOs to try to find out, "Gee, is there a shorter  
21 completion time somewhere else." So that was the reason behind  
22 taking this approach.

23 [SLIDE.]

24 MR. HOXIE: Therefore, to summarize all of this in  
25 the next slide, we have what I call proposed Guidance A which

1 simply says, "When a support feature is inoperable and an LCO  
2 for that support feature is specified in the technical  
3 specifications, the completion time stated in the support  
4 feature LCO to restore it to operable status must not be  
5 greater than the most limiting completion time of all the  
6 features it supports." Hopefully with the discussion we have  
7 had now, that is a clear statement. Let's go on to the next  
8 slide.

9 [SLIDE.]

10 MR. HOXIE: This may seem, you say, "Gee, there is an  
11 awful lot of support systems in a nuclear plant and I can think  
12 of some cases where this might be too restrictive" and so let's  
13 discuss if there might be some exceptions.

14 To do that, I would like to discuss a thing which I  
15 call the "directness of the support." Basically, there is  
16 direct support and there is indirect support. If you have  
17 something like electrical power, for example, if a motor  
18 doesn't have its electrical power, it is going to fail  
19 immediately. It can't do its function at all. It is a very,  
20 in terms of time, it is a very direct form of support.  
21 Electrical power is absolutely necessary and it is necessary  
22 now.

23 The same with lubricating oil say for a diesel  
24 generator. It is not going to run very long without it or even  
25 cooling water is quite often very necessary. You are not going

1 to run very long without it but there are other support  
2 systems, take for example, the ventilation system for a large  
3 room in which there are batteries.

4 In this case, the ventilation system may be, if the  
5 plant's FSAR says so and the design basis for the plant says  
6 so, the ventilation system might be a support system for the  
7 batteries and if you use the type of logic that I just now  
8 said, you would have to take the battery AOT of two hours and  
9 put it back as the completion time for the ventilation system.

10 So let's discuss if we always want to do that. Next  
11 slide, please.

12 [SLIDE.]

13 MR. HOXIE: To get around that, what we are  
14 considering is basically it is an exception to the General  
15 Guidance A that I just now had and it says that basically if  
16 you have an inoperable support feature, but that the support is  
17 more of an indirect nature, again like this ventilation system  
18 case, in that case we might allow the support feature  
19 completion time to exceed the supported feature completion  
20 time.

21 In this case then you have to think of the support  
22 feature completion time as being composed of an initial portion  
23 and then a final portion and during the initial portion of the  
24 support feature completion time, we will not cascade, we will  
25 not go around and declare all of the supported features

1 inoperable. What we would say is that we would give them some  
2 time up front, for example, to fix the ventilation system  
3 before they would have to cascade its inoperability into say  
4 the batteries.

5           However, if they are going to do that you would have  
6 to have some justification in the technical specifications  
7 bases based on either a risk analysis or some kind of safety  
8 analysis. Next slide, please.

9           [SLIDE.]

10           MR. HOXIE: This slide puts up then exactly the  
11 example that I have been referring to. The support system then  
12 is say a ventilation system for a room that has batteries in it  
13 and supposedly there is some justification in the bases that  
14 says we think that the completion time should be 24 hours.

15           We have already discussed before that the batteries  
16 have a two hour completion time and what this guidance would  
17 say is that you would have 22 hours before you would have to  
18 cascade the inoperability of the ventilation system over to the  
19 batteries so you would have some up front time.

20           What it amounts to is that if you can make a  
21 justification in the bases that it is not in the public  
22 interest, it is not safe to challenge all of the safety systems  
23 and shut down the plant just because I have a fan out in a  
24 ventilation room for some batteries and that you have a risk  
25 basis for showing that that is the safer thing to do. Those

1 are the types of arguments that we would like to hear.

2 Next slide, please.

3 [SLIDE.]

4 MR. HOXIE: Then to summarize this Proposed Guidance  
5 B which is really an exception to Proposed Guidance A we can  
6 say it in these words. "When a support feature is inoperable  
7 and it does not degrade the capability of the features it  
8 supports below acceptable levels until some time later as  
9 justified in the Bases for the support feature, then the  
10 initial completion time specified in the support feature LCO  
11 may exceed the completion time of one or more of the features  
12 it supports." Now this is an exception to the definition of  
13 operability.

14 During that 22 hours normally you would say, "Gee,  
15 the ventilation system is broken." At soon as the support  
16 feature for the batteries, the ventilation system is broken,  
17 you would normally have to say that the batteries are  
18 inoperable, also, but we are going to give you a 22 hour  
19 exception to the definition of operability and that is what  
20 this guidance is.

21 [SLIDE.]

22 MR. HOXIE: On the next slide, there is a little bit  
23 more to it. "If the support feature cannot be restored to  
24 operable status within the initial completion time specified,  
25 all the supported features involved shall become inoperable by

1 the definition of operability and the additional completion  
2 time for the support feature to restore it to operable status  
3 must not be greater than the most limiting completion time of  
4 the features it supports."

5 So this second piece is talking about what you do  
6 after the 22 hours. At that time, you have two more hours in  
7 the 24 where you do have to cascade the inoperability and the  
8 batteries do become inoperable.

9 Next slide, please.

10 [SLIDE.]

11 MR. HOXIE: This is basically the slide and we are  
12 moving into the third area of guidance that I talked about,  
13 what required actions and so I ask the question, "What are the  
14 consequences of having an inoperable support system?"

15 One of them is this idea of cascading. In terms of  
16 requirements, you do have to if the support system is  
17 inoperable, then its supported features will be inoperable and  
18 you do have to cascade, you do have to look at the required  
19 actions of the supported features.

20 So the question that comes up is when I have a  
21 support feature inoperable, what required actions do I have to  
22 take? I think everyone would agree that you have to take the  
23 required actions in the support feature tech spec. In other  
24 words, it is what is broken and if there is a tech spec on it,  
25 it is clear that you have to take those required actions.

1           Where it gets a little bit fuzzy at times is what  
2           about all of those supported features? Do I have to go do all  
3           the required actions of those supported features? Some of  
4           them? None of them? That is what we want to discuss now.

5                   [SLIDE.]

6           MR. HOXIE: Basically on the next slide for the  
7           supported features, the short form or the guidance is basically  
8           that all of the required actions from the supported features  
9           LCOs must be accomplished except those that can not be  
10          accomplished because of the inoperability of the support  
11          system.

12                   Basically we are saying we don't want you to do the  
13          impossible. We also, if you have a diesel that is broken, its  
14          lubricating oil system is broken, we don't want you to start it  
15          and run the diesel if that was what the required action is,  
16          those are some of the things. We don't expect you to do the  
17          impossible but if there are required actions for the supported  
18          feature such as "call the NRC," "start taking data," do items  
19          like this, then we do expect that those actions would be  
20          followed.

21                   MR. CALVO: Excuse me for interrupting but I guess  
22          what we are doing today when we lose a support feature, let's  
23          assume that we lost train A in the electrical power system, all  
24          the LCOs from the technical specifications must be entered to  
25          find out which one is the most limited. You cascade to all of

1 those. Can you imagine the burden that that must be for the  
2 operator?

3 He has to go through all of those, find out where is  
4 the most limited, focus into that one and see what he can do  
5 now and also he has to go through all those other LCOs and find  
6 out all the things we asked him to do, "call the NRC," "collect  
7 data," "look at the redundant counterpart immediately."

8 By the time all the thing is done, that particular  
9 transient, the point is that there are more important things to  
10 do by somebody who has to go through pages and pages and by the  
11 time he finishes, we had done the simulation up in Chattanooga,  
12 the operator focused to the wrong thing.

13 He is not focusing to the safety of the plant. He is  
14 focusing on going through all those pieces of paper there and  
15 looking criss-cross to procedures and by the time he finishes  
16 with some of the customized tech specs, it could be as long as  
17 hours.

18 In the meantime, everyone is screaming, "I have lost  
19 the whole train," "the plant is down," "I need to do things  
20 now" but the operator is worrying about that because if you  
21 don't do that, then there are going to be violations. There is  
22 going to be enforcement.

23 We tried some kind of way to get around that by  
24 making this proposal.

25 [SLIDE.]

1           MR. HOXIE: To summarize then what this third piece  
2 of the proposed guidance is, it simply says that once a support  
3 feature is declared inoperable and its supported features  
4 become inoperable by the definition of operability except as  
5 indicated in proposed guidance B, that was the exception, the  
6 required actions specified in the supported features LCOs which  
7 are not impacted by the inoperability of the support feature  
8 must be accomplished in accordance with the completion time  
9 specified in the LCO. All other required actions specified in  
10 the support feature LCO must also be accomplished.

11           Next slide, please.

12           MR. CALVO: Let me just interject something.

13           MR. HOXIE: Sure.

14           MR. CALVO: We looked at the tech specs and we found  
15 out, we had determined approximately that all these other  
16 support features that must be accomplished, there are not very  
17 many, something on the order of about five percent of what you  
18 normally do is those features that you have to do immediately  
19 right after the support system becomes inoperable.

20           So those can be -- what you do today, you can almost  
21 enter LCO and figure out where they are or have them listed in  
22 a procedure so you can go through them all at one time. That  
23 is what I would do if I were operating a nuclear power plant.  
24 I don't want to go through all the LCOs.

25           I will take them aside and the procedure when I lost

1 a whole train, when I lost power to a whole distribution  
2 system, then I know exactly what I must do there. We say that  
3 it is about five percent of those special actions that you have  
4 to do. So if you can plan ahead, you don't have to enter every  
5 single LCO because once you enter and you find out what you  
6 have to do, the next time you don't have to do it so once you  
7 do it, you might as well take that knowledge and put it aside  
8 and enter those procedures when you lost that particular train  
9 and then do those special actions.

10 [SLIDE.]

11 MR. HOXIE: Moving on then to the fourth piece of  
12 proposed guidance, Proposed guidance C, here we are talking  
13 about inoperable support features that are no in the tech  
14 specs; in other words, the support feature is not tech spec'd.

15 In this case the licensee has the responsibility to  
16 make a prompt determination of the operability of all of the  
17 supported features affected by the inoperable support feature  
18 or features and to take the applicable tech spec remedial  
19 actions.

20 Basically, I am going to go ahead and bring up the  
21 topic, it has as next word, "prompt" and prompt is kind of like  
22 immediately. If you walk by a support feature and there is a  
23 wire hanging off of it, prompt in that case means pretty darn  
24 fast.

25 There are some other types of situations where prompt

1       may take a while because it may take a while to determine  
2       whether the supported feature is impacted. So it is very  
3       difficult to put a precise hour figure on it.

4               MR. CALVO: May I supplement that?

5               MR. HOXIE: Sure.

6               MR. CALVO: I guess we are looking at prompt, I think  
7       prompt must be commensurate with the safety importance of the  
8       equipment you are looking at. If it is something that is  
9       really important, maybe you want to come out with a quick  
10      determination of operability.

11              If it is a support in a pipe or support in a cable  
12      tray and you know a quick determination, it looks like it is  
13      giving a design basis event, seismic event, the tray is now  
14      going to fall down, cut the cable and actually make a lot of  
15      equipment inoperable, that prompt determination could very well  
16      go for longer than 24 hours.

17              So I guess again, it is commensurate with the initial  
18      evaluation which would tell you what to do next. Now if you do  
19      that in a particular case, and you find out that the support  
20      and you say, "No, never mind and the integrity of the cable  
21      tray, we will be maintaining given the worst case condition or  
22      the worst case design basis event," then you say, "yes, it is  
23      the support system but the interaction with the support system,  
24      cable trays, cables and switchgear" and you say, "No,  
25      nevermind" therefore, all the supporting system remains

1 operable. But it is going to be different in each case. It is  
2 very difficult to quantify what you do and generalize it. It  
3 is again commensurate with the importance of the equipment in  
4 question.

5 [SLIDE.]

6 MR. HOXIE: So to summarize this, the proposed  
7 guidance D is on the next slide. It says, "When a support  
8 feature is inoperable and an LCO for that support feature is  
9 not specified in the technical specifications, and if it is  
10 determined that such a support feature will impact supported  
11 features LCOs specified in the technical specification, then  
12 all the impacted LCOs for the supported features must be  
13 entered."

14 That is a summary of what we were just discussing.

15 [SLIDE.]

16 MR. HOXIE: The final case that we are talking about  
17 is one where the simplest way to say it is it is a case where  
18 the support feature in a given case is not really a support  
19 feature. If the supported features can still perform their  
20 safety function without the support feature, then there is  
21 really some question in that case whether the support feature  
22 should even be called a support feature and what this proposed  
23 guidance tries to do is, I think, is state the obvious thing.  
24 In that case, you really don't have to do very much.

25 What it says is that when a support feature is

1 inoperable, regardless of whether or not an LCO for it is  
2 specified in the technical specifications, and if it is  
3 determined that the supported features governed by the tech  
4 specs are capable of performing their intended function with an  
5 inoperable support feature, then no additional action is needed  
6 in the supported features tech specs.

7 I don't believe that is anything different than what  
8 the licensees are doing now. At that point then, that is about  
9 all that I wanted to say about support systems. I think the  
10 second part of the talk is on completion times but I would like  
11 to break here for just a moment and see if anyone has any  
12 questions on support systems.

13 MR. STENGER: Dan Stenger with Bishop, Cook, Purcell  
14 and Reynolds. On proposed guidance D toward the end where you  
15 talked about "then all the impacted LCOs for the supported  
16 features must be entered," is that intended to be -- it is  
17 slide 17 actually -- is that intended to be the minimum, the  
18 most restrictive LCO in actions taken. It says "all." I am  
19 not sure if that was what was intended.

20 MR. HOXIE: Just because you enter the LCO, basically  
21 you would enter the LCOs and then you would do what the LCOs  
22 say and the chances are that most of the required actions in  
23 the LCOs, it depends on the situation, but that many of the  
24 required actions you would not have to take.

25 So in a way I can understand where you are coming

1 from with your minimal set.

2 MR. CALVO: But again let me supplement.

3 MR. HOXIE: Go ahead.

4 MR. CALVO: It says, "When a support feature is  
5 inoperable and an LCO for that support feature is not specified  
6 in the technical specifications, and if it is determined that  
7 such a support feature will impact supported features LCOs  
8 specified in the technical specification, then all the impacted  
9 LCOs for the supported features must be entered."

10 I guess the question is, if I got outside the tech  
11 specs support system, it could be many support systems and I do  
12 an engineering evaluation to determine whether the support  
13 system either through a surveillance, so kind of the ASME  
14 testing and determined that it was something wrong, then I must  
15 ask myself the question, first of all, how many other safety  
16 systems have been in some kind of way degraded because of the  
17 inoperability of that support system.

18 So first you look outside the tech specs and then in  
19 some kind of way you go to the other systems and find out where  
20 the implications are. Then you must ask another question. How  
21 about all those other systems which are controlled by the  
22 technical specifications, are also those impacted by that  
23 support feature?

24 When you ask that question through engineering  
25 evaluation, then if you have any of those in the technical

1 specifications, then you must enter those and find out what  
2 those ask you to do.

3 It is not only tech specs. Tech specs is only a very  
4 small part of the systems in the plant. There are more things  
5 outside the tech specs. Only those things that are important  
6 are in the tech specs.

7 MR. CESARE: I am Guy Cesare from Grand Gulf. Jose,  
8 I have two questions. The second one you might want to defer.  
9 Firstly, has the staff thought of and it does look like you  
10 have put a lot of thought into this in the arrangement of these  
11 concepts, have you considered that some allowable outage times  
12 have different technical bases such as AC power distribution  
13 system which says one division de-energized is eight hours and  
14 that is a different concept, a different vulnerability.

15 You were talking about then a diesel generator, on  
16 site power supply, inoperable that is 72 hours and so you  
17 distinguish in your remarks that power supply, two sources is  
18 one issue and then we talk about the slide showing the example  
19 of varying LCOs and which one you would choose.

20 Those numbers you had there for that example, if all  
21 those numbers 24, two and eight, whatever they were have the  
22 exact same technical basis, then the logic works. If they do  
23 not have the same technical basis, then it doesn't seem like it  
24 may be appropriate and it may be inappropriate to put the plant  
25 in that kind of allowable outage time for shutdown.

1                   Has the staff considered that and how do you remedy  
2                   that?

3                   MR. CALVO: Correct me if I don't understand what you  
4                   are saying, if I have a support feature and let's say it is a  
5                   distribution system, a 4,160 volt distribution system which  
6                   goes to more control centers which eventually goes to a battery  
7                   charger, okay, then when I lose the distribution system, you  
8                   look around and you find out that the particular distribution  
9                   system has a pump in there which has 72 hours allowable outage  
10                  time and, of course, there it pumps an air compressor and that  
11                  instant air compressor becomes a safety system, maybe there  
12                  would be five days allowable outage system and you go through  
13                  all the evaluation and all the assessment, but the one who is  
14                  actually leading the parade is that battery charger.

15                  So, yes, we consider all those possibilities but you  
16                  may have a different technical basis but the one that is the  
17                  most limited of all happened to be the battery charger. Now in  
18                  some designs, the battery charger is not two hours, it is eight  
19                  hours. Under those conditions, then eight hours is okay. The  
20                  distribution system today in the existing tech specs, you have  
21                  eight hours up there. Normally you feel that it was important  
22                  enough to have eight hours.

23                  I don't know how that number got there. It was  
24                  grandfathered over the years. We can look at it and I guess  
25                  the interim Commission policy allows you to come out with a

1 number that it can either make it smaller or it can make it  
2 larger depending on the operating experience and based on the  
3 analysis that you had done.

4 Have I understood your question or have I missed it  
5 all together?

6 MR. CESARE: I think you are close. You have given  
7 it some thought.

8 MR. CALVO: Yes.

9 MR. CESARE: An example that I might be better versed  
10 on and Les Kintner and Bob Giardina are more familiar with it  
11 at Grand Gulf is ESF broom coolers which is a ventilation  
12 function cooling ESF switchgear, part of AC divisional power  
13 supply distribution system, that switchgear if inoperable is if  
14 de-energized is eight hours.

15 MR. CALVO: The switchgear, that is correct.

16 MR. CESARE: If the switchgear is de-energized, then  
17 that is one condition of somewhat severe exposure to the plant  
18 with all that gear de-energized apart from availability of the  
19 diesel or off site power. If the bus is de-energized, eight  
20 hours seems appropriate and there are other ones more severe  
21 for DC power.

22 Does the staff contemplate that that eight hours has  
23 a certain vulnerability, a certain risk, as opposed to the ESF  
24 switchgear ventilation which if it is inoperable and not able  
25 to cool that room, that there is a different technical basis

1 and it looks like Guidance B is talking to that.

2 MR. CALVO: We did consider about the switchgear, the  
3 temperature rises on the breakers, all the things and we  
4 figured that if you lost the ventilation of the cooling, also  
5 given the worst case condition, a DBA when you assume the  
6 maximum cooling from a given period of time, we assume that if  
7 you lose ventilation on the systems, we feel that you have some  
8 time before the temperature got to the point that with the  
9 equipment as degraded below a level that it can't perform the  
10 intended function.

11 That flexibility is there right now for all the  
12 plants. If you feel that you can show that certain support  
13 systems are unduly restricted when there is a failure, you can  
14 make that point, that the equipment is designed to withstand a  
15 loss to the ventilation system for seven days. If you prove  
16 that case, that after seven days given a worst case condition,  
17 the temperature goes high, high to the point that it degrades  
18 the capability, then at that time it becomes inoperable and  
19 then you must take the eight hours action in there for that  
20 switchgear.

21 So yes, that is the whole concept, the whole  
22 philosophy. I think it gives you a latitude without hanging  
23 you up with a system which is very time delay or lagging to  
24 degrade the capability of the system below an acceptable level  
25 by giving you that additional time to fix it and that is the

1 philosophy that we tried to follow and I think you can use that  
2 philosophy today. You don't have to wait for the tech spec  
3 improvement program to convey that philosophy. That philosophy  
4 is available today. If you submit an amendment to us, we will  
5 entertain that philosophy.

6 MR. CESARE: That leads to my second question which  
7 you might want to defer. It deals with how this guidance is  
8 promulgated. What you have just described is a process whereby  
9 we would consider these ESF switchgear room kind of systems  
10 that are not treated very well in tech specs --

11 MR. CALVO: That's right.

12 MR. CESARE: In fact, I have an open issue with the  
13 staff that I am probably going to generate a tech spec change  
14 specifically for that. You have generated in your process here  
15 of coming up with this guidance lots of new terms basically,  
16 initial completion time, additional completion time, direct,  
17 indirect, directness -- things that impacted.

18 On one page it says in English I understand and then  
19 the next page, the guidance uses the term "impacted." I find  
20 it a little difficult to see how you are going to promulgate  
21 this to the region in short order where it is going to be an  
22 auditable criteria. What is the process?

23 MR. CALVO: I think what we are trying to do is right  
24 now for the last 16 years, we have been talking about these  
25 terms. Everybody is still confused. The readers are confused,

1 we are confused, you are confused and it is about time that  
2 both the staff and the industry started speaking with a single  
3 voice on this.

4           When I used to be a project director, I used to be  
5 calling at night all the time. How do you interpret that  
6 technical specification? Are we going to shut down the plant  
7 or we are not going to shut down the plant? So I felt when I  
8 got this job, I felt that it was about time that we put this in  
9 perspective, give you at least from a logical, practical point,  
10 what should be done.

11           It is ridiculous to lose the ventilation system for a  
12 battery charger and then shut down a nuclear power plant. It  
13 doesn't make sense. I think that is more unsafe than safe.  
14 The same thing will apply for the coolers. If you have a  
15 design that is capable to perform the intended function of the  
16 loss to cooling, why not use that capability? Why shut down  
17 the plant and rock the boat and challenge the safety system?

18           The words aren't important but the important part is  
19 that everybody understand what operability means, that  
20 everybody understand what support systems means and what is the  
21 latitude and also from the standpoint that you are confronted  
22 with a transient on that plant, don't go through the paperwork  
23 to find out what you have to do, pre-plan the actions so you do  
24 what you are supposed to do and worry about the plan that was  
25 the important thing to do. We have not been doing that for 16

1 years. I think it is about time now that we consider those  
2 possibilities and generally come up with something that  
3 everybody else can understand. That is the approach.

4 MR. ABBOTT: Ed Abbott. Has the staff looked at the  
5 effect of this guidance on a two-train action statement and how  
6 it would be implemented? For example, if you have an RHR pump  
7 out of service on one side and the ventilation system out on  
8 the other side, right now you would have to enter the two-  
9 train action statement. Would this guidance relieve you of  
10 having to do that or not?

11 MR. HOXIE: It would give you some flexibility.

12 MR. CALVO: Remember when you got a slow response  
13 system here, that can be considered. You have one ventilation  
14 on one side and the other ventilation on the other side, I  
15 think you must consider that. Of course, the time that you are  
16 going to allow because of the urgency of it is going to be  
17 less.

18 MR. ABBOTT: Right.

19 MR. CALVO: But again, that is another thing that  
20 should be considered, why not? I have a system that is the low  
21 response system. I have my switchgear designed to withstand a  
22 high temperature rise, if I have the right temperature outside,  
23 I am not even need a ventilation system in some cases. Why not  
24 take advantage of that? That's fine.

25 Today what you will do most probably, you go to a

1 loss of function, right, you go to a 303 and you into immediate  
2 shutdown. Is that the right thing to do? The answer is no.  
3 It is not the right thing to do.

4 So all we are doing is making aware to you that it is  
5 flexibility and the staff is receptive to giving those kind of  
6 commitments, we don't want unnecessary plant shut-downs  
7 assuming that certification can be fully justified as to why  
8 you have additional time.

9 MR. HOXIE: Any other questions?

10 MR. STENGER: I have a more general question and  
11 maybe it is in the nature of a comment. Dan Stenger again.  
12 Following up on Mr. Cesare's point, if this guidance will be  
13 promulgated through a generic letter or something like that, I  
14 think since as you recognize many people are confused about  
15 this issue, I would strongly encourage you to seek industry  
16 input on this subject and I know a lot of work is going on with  
17 tech spec improvement.

18 MR. CALVO: Absolutely. The whole purpose of this  
19 meeting, things got hot on these issues. I guess the  
20 predecessor of this was the famous Clinton letter which has  
21 applied to everybody but it applies only to Clinton and there  
22 was a lot of commotion originally. What are we going to do  
23 next? NRR is going to tell us what kind of direction to give.

24 So I said, "Well, presumably we are moving ahead with  
25 this" and then we felt that maybe several times, we could put

1 this story together so we can get not only the original  
2 comments because that is the people working on the fringes  
3 there but we also want to get it from the industry  
4 representatives.

5 We all have to be together, working together in this  
6 effort but I want to move it forwards to the point that we  
7 start, interpretations are happening every day, the challenge  
8 to the plants stopping every day. We have to put on the record  
9 quickly how the staff feels about these things and then we will  
10 talk to the regions. We are going to have the regions here  
11 coming up soon and we are going to be discussing those things.  
12 I am not worried so much about the words. I am worried about  
13 the understanding. If we can understand what we are saying and  
14 the flexibilities, I think we can talk to each other better.

15 MR. HALL: Warren Hall, NUMARC. Let me ask a  
16 question. Suppose there is a case where the ventilation system,  
17 a non-safety ventilation system that would define the battery  
18 room if you will, what do you do in a case like that where you  
19 have that capability and you still have on site/off site power  
20 and you just lost a safety grade ventilation train, you can  
21 still cool the room, you can still maintain your equipment  
22 qualification, where do you put the utility? Do you put it in  
23 a box there?

24 MR. CALVO: No, let me put this way. We asked that  
25 question ourselves. Suppose you have a ventilation system and

1 somebody says, "Why don't you open the door and let some air  
2 come in, let's open a window and let some air come in or let's  
3 bring a fan and let that fan get some air moving in there" and  
4 the question is, if that was something that was analyzed, pre-  
5 analyzed, and determined to be acceptable, fine, you can do  
6 that as long as it wasn't connected to a safety related system.

7 But it has to have been previously analyzed. If you  
8 haven't previously analyzed it and you felt that it is  
9 important for you to do it, then you prepare an engineering  
10 evaluation and submit it and most probably considered to do a  
11 10 C.F.R. 50.59 and it is a perfectly good case to do it but  
12 you have to make your own case.

13 Keep in mind that the basic responsibility for safety  
14 is not with us. It is with you. You are the licensees of  
15 these nuclear power plants. You are the ones who are supposed  
16 to assume that basic responsibility. All we are is policemen  
17 in here. We want to be sure that we are monitoring and that  
18 you are assuming that responsibility and you have a lot of  
19 latitudes up there that you can do this kind of a thing.

20 MR. HOXIE: It looks like we are ready to go on to  
21 part two, completion times but perhaps we should take a ten  
22 minute break first. Let's come back at 10:15.

23 [Brief recess.]

24 [SLIDE.]

25 MR. HOXIE: I think we will get started on the second

1 part. We have a couple of attendance sheets coming around, so  
2 if everyone when it comes around, please sign in and make sure  
3 you sign it before you leave so we can get an attendance.

4 Also, a few people have asked about transcripts. If  
5 you would give Lynn your business card, then she will give it  
6 to us and we will distribute, we will take care of the  
7 distribution of the transcripts.

8 So let's talk about completion times now.

9 [SLIDE.]

10 MR. HOXIE: As I mentioned earlier, a completion time  
11 like a strict definition of it or a simple one is that simply  
12 it is an amount of time to complete a required action but I  
13 want to come at it from a little different point of view. It  
14 is one that Jose in his talk was talking about, like AOTs are  
15 completion times.

16 The way that they got into the tech spec is what it  
17 really is that the LCO is like the minimum functional state  
18 that you want to be in and if you don't meet the LCO, then you  
19 are in an action statement and while you are in the action  
20 statement, you are giving up single failure protection and so  
21 you only want to be in that degraded state for a little while  
22 and so from that point of view, the completion time is an  
23 amount of time that you feel that you can be at this risk.

24 It is an acceptable amount of time to be at risk to  
25 not be able to withstand a single failure if you had a design

1 basis accident. If you keep that point of view in mind, you  
2 will have an easier time of understanding where the staff is  
3 coming from on these completion time definitions.

4 Basically, as this slide therefore says, if you  
5 follow that type of philosophy completion times then don't  
6 belong to components. Completion times like in say a one pump  
7 or two pump system, they belong to like the level of  
8 degradation of the plant.

9 In other words, if you have 72 hours for a diesel  
10 generator to be out, it is 72 hours for one diesel generator.  
11 It doesn't matter which one. It is not 72 hours for this  
12 diesel over here and then I get an additional 72 for this over  
13 here.

14 The idea of the 72 hours is that we will accept being  
15 one level degraded being without a diesel for one diesel for up  
16 to 72 hours in a row. That is the philosophy behind this.

17 [SLIDE.]

18 MR. HOXIE: To give some examples then, I am going to  
19 go through basically four completion time examples to  
20 illustrate how we work with these completion times. Basically  
21 I am going to use the first section of the electrical power of  
22 any, probably most typical electrical power system specs. It  
23 usually called AC sources - Operating.

24 The LOC in such a spec will usually have two main  
25 requirements, that you have to have two physically independent

1 off site circuits running from a switchyard to the safety buses  
2 and that you have to have two separate and independent diesel  
3 generators.

4 Then if you don't meet that LCO, then you have  
5 usually a set of conditions and in a very summary form for just  
6 the discussions here, I have conditions A through F and very  
7 briefly the descriptions which are condition A is like one off  
8 site inoperable; B is one diesel generator inoperable; C is one  
9 and one, one diesel and one off site; D is two diesels  
10 inoperable; E is two off sites inoperable and F is a condition  
11 that you go to if you fail to either meet the required actions,  
12 basically it is a condition you go to if you fail to meet the  
13 required actions within the completion times and the completion  
14 times are listed in hours out in the far column, 72, 72, 12,  
15 two and 24.

16 So you might want to keep that slide because you are  
17 going to need it to sort of be able to follow the four  
18 completion time examples I will do. It is also written up here  
19 behind me but probably too small and you will be better off  
20 just using the slide in your packet.

21 Next slide, please.

22 [SLIDE.]

23 MR. HOXIE: The first example is that an operator  
24 comes on shift one morning and he finds out that at some  
25 initial time zero, that he has two off sites inoperable. Then

1 if you go to your sheet, you will find out that you are in a  
2 condition E which is 24 hours that you have for a completion  
3 time but then half way in, so you start out at time zero and  
4 you have 24 hours for your completion time because you have two  
5 off sites inop but at point B, 12 hours into while that clock  
6 is ticking, one of the off sites is restored and the question  
7 arises is how much time is left before proceeding to condition  
8 F?

9           The idea is that you would actually have 60 hours.  
10 What we worry about is that somebody would say, "Well, gee, I  
11 entered condition B at the 12 hour mark and condition B says  
12 that I have 72 hours," it is actually condition A, one off site  
13 inop, you don't get 72 more hours from the 12. That is what we  
14 are trying to say. You only have 60 hours left and the idea is  
15 that during that 72 hours that we were discussing, you had one  
16 off site inoperable during that whole time and that is all that  
17 we are going to allow.

18           Let's do the next example. I want to mention on that  
19 particular one, we recently conducted a training exercise down  
20 at the Technical Training Center in Chattanooga, Tennessee  
21 where we asked some training instructors, former plant  
22 operators and some trainees these questions and on that first  
23 one, we had basically 100 percent of the participants said 60  
24 hours. So there didn't seem to be a lot of misunderstanding  
25 about that particular one.

1 [SLIDE.]

2 MR. HOXIE: Let's now go to example two. This one,  
3 at time equals zero or point A on the time line down there, you  
4 have one off site inoperable and so in that case you would look  
5 at your conditions, you would be in condition A and you would  
6 have 72 hours.

7 Then you are working along trying to fix that one off  
8 site but 60 hours into that event, you lose the second off site  
9 so now you have two off sites inoperable and the question then  
10 becomes at point B, at 60 hours, how much time do you have left  
11 before you shut down?

12 If you look for two off sites inoperable, the  
13 completion time says 24 hours. However, since you have been  
14 without an off site for already 60 hours, losing a second one  
15 you are still without the first off site, so you really only  
16 have 12 more hours left. So you really have again using this  
17 philosophy, you have been without an off site for 72 hours and  
18 that is all that we are going to allow.

19 Again now at Chattanooga when we asked that question  
20 of the participants, 100 percent of them answered it this way  
21 so I don't think there is too much misunderstanding here.

22 [SLIDE.]

23 MR. HOXIE: The third example we have is one that we  
24 start out at time equals zero with one off site inoperable in  
25 which case starting at time zero, you would say I have 72

1 hours. Then at 12 hours in at point B, you lose the second off  
2 site which puts you into at that point, you would have 24 more  
3 hours to go so that once you have lost two here, you would  
4 actually be shutting down or going to condition F at 36 at  
5 point D but then we throw in an additional complication that  
6 before you hit the 36 at point C, you restored one of the off  
7 sites and so the question is then, at point C you are back to  
8 just being down to one off site less, how much time do you have  
9 left.

10 Basically the interpretation again is really the same  
11 as the other two, that you started way back at time zero, all  
12 this time you have been without one off site and you therefore  
13 have 72 minus 24 or only 48 more hours left before you would  
14 have to go to condition F.

15 At Chattanooga, on this one there did seem to be a  
16 little bit more confusion. If I remember right it was 70  
17 percent of the people answered it this way. Thirty percent of  
18 the people wanted to essentially allow more time but that is  
19 still a majority of people with operations experience are  
20 interpreting it this way.

21 [SLIDE.]

22 MR. HOXIE: Going on to example four, this is one  
23 where I think it is a little bit more difficult but basically  
24 the concept is that the LCO covers diesels and off sites and  
25 once you get into that LCO as soon as you enter the LCO that

1 covers diesels and off site, a clock starts ticking and you  
2 can't turn that clock off until you have fixed all your diesels  
3 and your off site.

4           So with that in mind, let's go through the example.  
5 At time equals zero, I lose one off site and that would  
6 normally give me 72 hours. Then 12 hours in at point B, I lose  
7 a diesel generator so now I have one off site and one diesel.  
8 That is condition C if I looked at my specs and it says that at  
9 this point that condition C gives you for one off site and one  
10 diesel, you have 12 more hours so that I would have from 12 to  
11 24, I would have that time interval to either fix one of the  
12 diesels or fix one of the off sites.

13           But then at point C, halfway into that, I said, "Gee,  
14 I restored an off site so now all I have is a diesel generator  
15 inoperable" and so the question becomes how much more time at C  
16 where we are down to just one diesel generator inoperable do I  
17 have left?

18           Still the interpretation is that you have a 72-hour  
19 clock that is running and that you really only have 54 hours  
20 left. The other interpretation that some people might have is  
21 that since at point C, you have just one diesel inop, that you  
22 should have 72 hours from when the diesel generator was first  
23 discovered inoperable but that is not the way that we are  
24 interpreting it.

25           QUESTION FROM THE FLOOR: Why?

1           MR. CALVO: I will tell you why. It goes back again  
2 to the fundamentals of the tech specs, the purpose of the tech  
3 specs. When we go back again, the relationship of the tech  
4 specs to the safety analysis of the plant. It goes back again,  
5 the approval of a license based on the general design criteria  
6 and the general design criteria for the fluid systems where it  
7 says to you for the capability of the particular system, the  
8 system will be capable of performing the intended function  
9 assuming with all on site power available and off site power is  
10 not available.

11           So we want to be sure that when you come down here,  
12 when one of those sources becomes inoperable and we allow it to  
13 be in violation of the general design criteria and be in  
14 violation of a possible single failure criteria, that we want  
15 to stay there for a limited amount of time.

16           Trying to understand it, yes, then you are in  
17 essence, you are increasing the risk that you can be without a  
18 capability to meet the general design criteria or to meet a  
19 single failure.

20           Now if you feel that you can justify why 72 hours is  
21 too short and you justify that you have diesels that are so  
22 reliable and so available and you can prove it through  
23 experience or risk and you can extend out from three days to  
24 six days, that is fine.

25           But when you come out with the number there, that is

1 the number that you are at risk, the things that we had  
2 established as the basis for giving you a license and we want  
3 to be sure that when you are there with equipment inoperable  
4 that we do what we can to put it back to the operable status.

5 That is our philosophy. The option you have is to in  
6 some kind of way challenge that philosophy and the standards  
7 allow at times to satisfy consistent with the reliability of  
8 the equipment and the proving experience on your part. At  
9 least, that is the reason for doing it this way.

10 As a matter of fact and I didn't want to bring it up  
11 but if you will allow me and I didn't want to bring it to this  
12 meeting without the owners being here, in the Technical  
13 Specification Improvement Program, some of you are more  
14 restricted than we are in the application of this. As a matter  
15 of fact, you are more from the standpoint of being more  
16 conservative, you allow less flexibility in this completion  
17 time than what the NRC staff proposed.

18 Again, that is our philosophy. It is our view at  
19 this time. It is there on the record. People can talk about  
20 it. You can think about it.

21 MR. LOZITO: I am Ed Lozito with Virginia Power. How  
22 many people got this answer correct?

23 MR. HOXIE: In all honesty, this particular question  
24 was not asked of the people so I don't have a data point for  
25 you.

1           MR. CALVO: I know why it bothers you because it  
2           bothers me, too. As a matter of fact, Chris and I had that  
3           discussion before. You are talking about a diesel and we are  
4           talking about the off site power system. Why can't you  
5           consider them separate? Why don't we do an LCO for the diesel  
6           and why don't we do an LCO for the off site power?

7           If we do that, those can be treated independently and  
8           we don't have to put them together. We felt when you are look  
9           at how the LCO is structured and the definition of operability,  
10          either one or the other makes a particular load operable. The  
11          absence of both make it inoperable.

12          Also, they have some requirements in there which says  
13          that if I lost the power, if I lost one source on one train and  
14          I got a component inoperable in the other train, if I happened  
15          to postulate a design basis accident concurrent with a loss to  
16          off site power, that results in a loss of function. Do you  
17          understand what I am saying there because that is an important  
18          one.

19          We don't know which component in the other train but  
20          if we have one diesel down and then the window of vulnerability  
21          is small but if something happened during the window of  
22          vulnerability and we got an inoperable component in the other  
23          and we happened to have an accident at that time, you are going  
24          to lose function and that is why we combined it.

25          If I say, if I got this diesel down and I got a

1 component in here, LB22 inoperable, and then I got a loss of  
2 off site power concurrent with the DBA, I am going to lose this  
3 bus. I lost LA22. If that one happens to be down, then I also  
4 lost that one.

5 If you go back into the conditions that you have not  
6 put in there, under those situations you allowable outage time  
7 becomes very, very small because there are you operating in a  
8 condition that doesn't meet the general design criteria, it  
9 doesn't meet the single failure and there you must do quickly  
10 get out of there and fix it or go back to a mode where you can  
11 be safe. That is the reason we combined them. That is the  
12 reason why we gave them the same weight.

13 MR. HOXIE: That is basically the end of the  
14 examples. I would take other questions on completion times.  
15 Thank you all for coming. Do you have some closing remarks?

16 MR. CALVO: Yes, I have some closing remarks.

17 MR. HOXIE: Sure.

18 MR. CALVO: Again, I want to reiterate the purpose of  
19 this meeting. The purpose of this meeting is to express the  
20 staff view on this matter which all of a sudden had come into  
21 recent attention in nuclear operating plants. We call them  
22 guidance.

23 At least you know now how the staff feels about these  
24 things. I think there is room for negotiation. I think there  
25 is room for dialogue in there. We can talk to each other but

1 at least we are all coming from a base. We had established the  
2 base.

3 Whether you agree or not agree with it, it is a base  
4 and now the question is how to meld that base and working  
5 together come in with something that is consistent with our  
6 charter, trying to protect the health and safety of the public  
7 and which is also consistent with your charter to make the  
8 plants available and safe and I think this provides on the  
9 table, on the record, how we feel about this issue which I feel  
10 is important.

11 I feel it is the foundation of the technical  
12 specifications. I think once you get these issues square in  
13 your mind, I think you will understand technical specifications  
14 and that was the whole purpose. We did it among ourselves.

15 The technical staff got together, we discussed these  
16 things. You can see that a lot of effort was taken to put it  
17 together. We want to share it with the owners group but some  
18 delay precluded us from doing that but we have to more  
19 forwards.

20 We have a lot of screaming regions out there saying,  
21 "Give us the interpretation." We are going to give them the  
22 understandings and I hope that everybody understanding and  
23 everybody talking together, we can come up with something in  
24 here that we can all march forward with and resolve this issue  
25 once and for all.

1           That is all I have to say. Thank you very much for  
2 coming here. I truly appreciate it.

3           MR. STENGER: Jose, what is your schedule for  
4 promulgating this guidance?

5           MR. CALVO: It is not a document. It is just a  
6 workshop that we are going to have. We have workshops with the  
7 regions all the time. As a matter of fact, we have workshops  
8 all through the months of December with the resident inspectors  
9 which we participate in and we talk about different topics.

10           As a matter of fact, NUMARC is involved in those in  
11 presenting the guidance to the 10 C.F.R. 50.59 and some of the  
12 people we have given some guidance to had to assess operability  
13 and discuss this kind of thing. So it is just part of the  
14 program that the NRR headquarters jointly with the regions do  
15 these things coincident with the resident inspectors meetings.

16           So again, thank you very much for coming here. I  
17 truly appreciate it. Thanks. Any questions anybody has before  
18 we close?

19           [No response.]

20           MR. CALVO: If not, the meeting is closed. Off the  
21 record. Thank you very much.

22           [Whereupon, the meeting was adjourned at 10:45  
23 o'clock a.m.]

24

25

REPORTER'S CERTIFICATE

This is to certify that the attached proceedings before the United States Nuclear Regulatory Commission

in the matter of:

NAME OF PROCEEDING: Staff Views on Technical Specifications

DOCKET NUMBER:

PLACE OF PROCEEDING: Rockville, Maryland

were held as herein appears, and that this is the original transcript thereof for the file of the United States Nuclear Regulatory Commission taken by me and thereafter reduced to typewriting by me or under the direction of the court reporting company, and that the transcript is a true and accurate record of the foregoing proceedings.

## ACRONYMS

DBA Design Basis Accident  
DBE Design Basis Event  
AOT Allowed Outage Time  
GDC General Design Criteria  
CT Completion Time  
OS Offsite Circuit  
DG Diesel Generator  
OTSB Technical Specifications Branch  
NRC Nuclear Regulatory Commission  
FSAR Final Safety Analysis Report  
TS Technical Specifications  
STS Standard Technical Specifications  
LCO Limiting Condition of Operation  
SR Surveillance Requirement  
SER Safety Evaluation Report  
CFR Code of Federal Regulations  
USAR Updated Safety Analysis Report

## **AGENDA**

- o PURPOSE OF TS**
  
- o TS AND THE SAFETY ANALYSIS**
  
- o OPERABILITY AND SUPPORTED SYSTEMS**
  
- o ILLUSTRATIVE EXAMPLES**  
**USING ELECTRICAL SYSTEM**

## PURPOSE OF TS

- o COMMISSION POLICY STATEMENT
  
- o 10 CFR 50.36
  
- o TO PRESERVE THE VALIDITY  
OF THE SAFETY ANALYSES

## TS AND THE SAFETY ANALYSIS

### o POLICY STATEMENT CRITERIA

BASED ON DBAS

### o LCOS AND AOTS BASED ON GDC

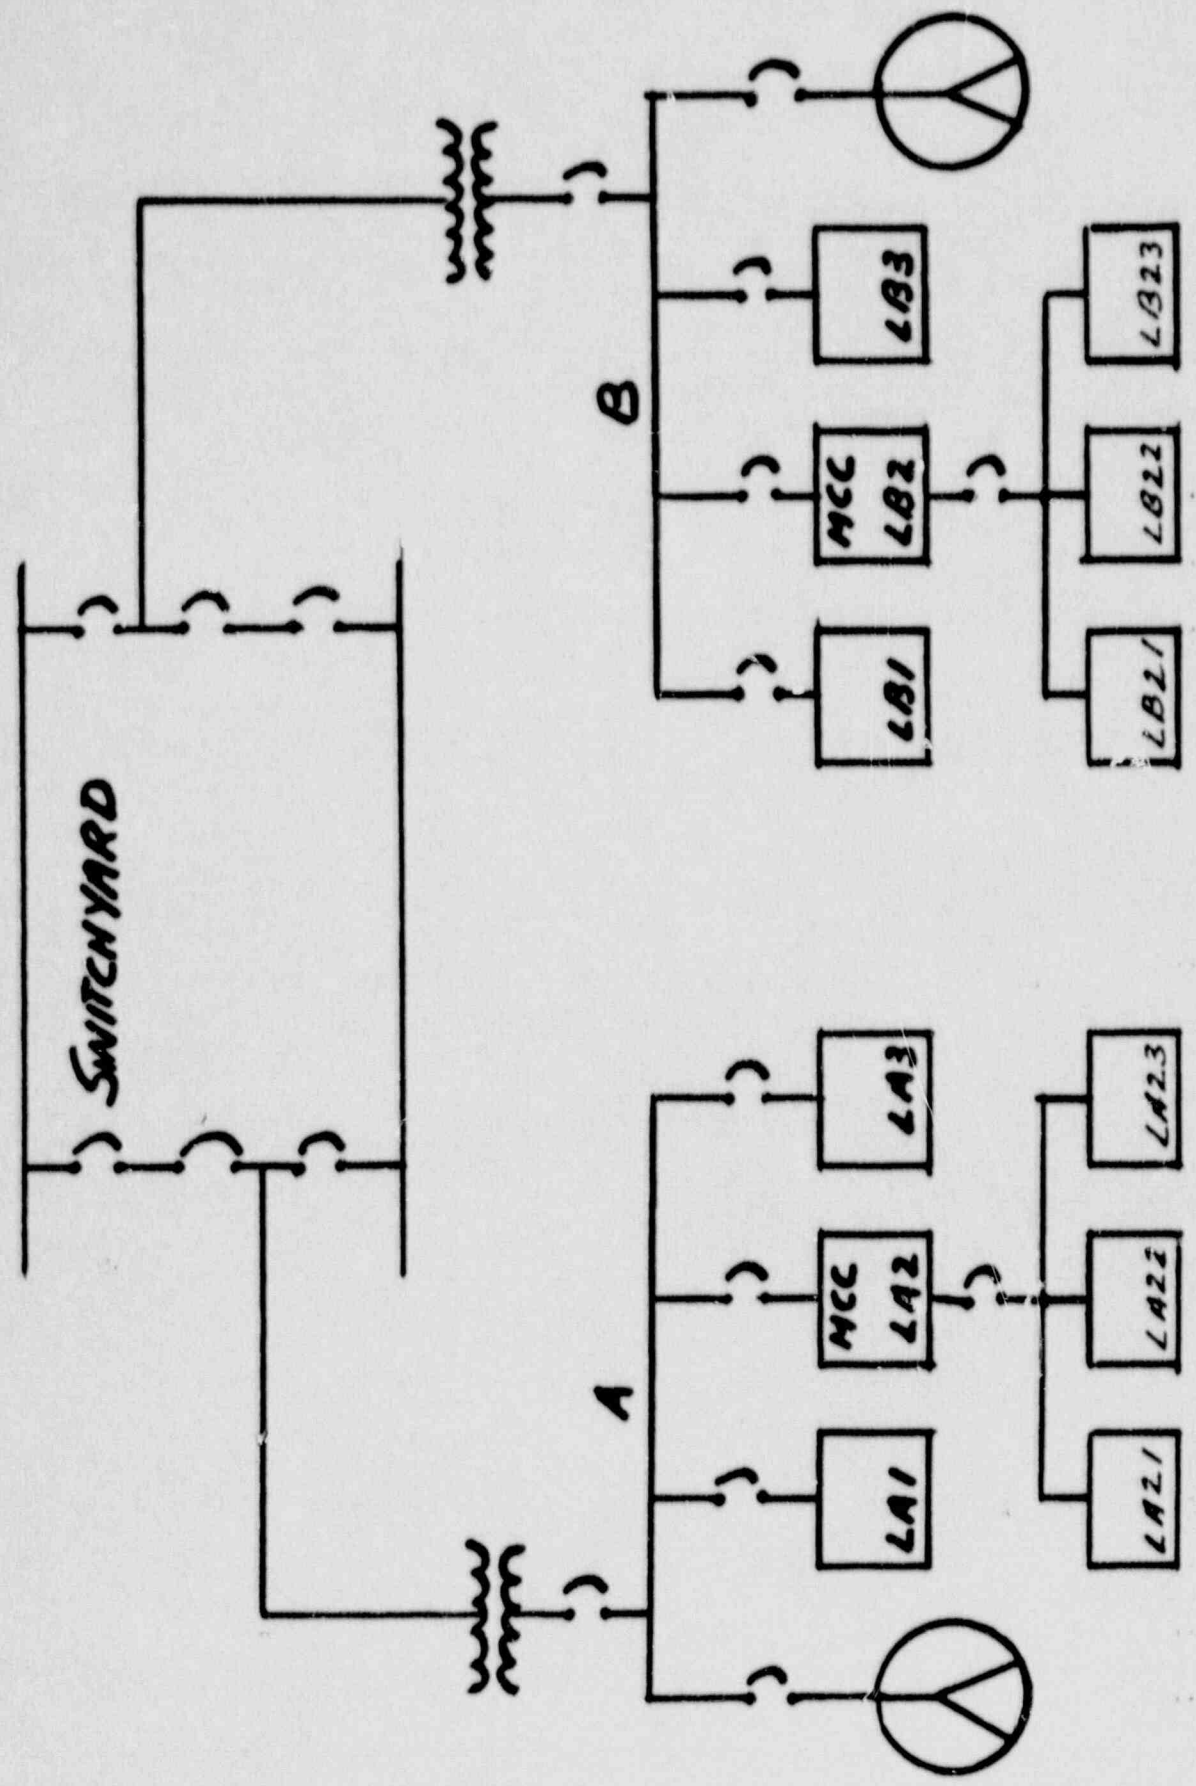

- SYSTEMS/CONDITIONS RELIED ON FOR DBA
- SINGLE FAILURE CRITERION
- LOSS OF OFFSITE POWER
- LOSS OF SAFETY FUNCTION

## OPERABILITY AND SUPPORT SYSTEMS

- o DEFINITION OF OPERABILITY
- o SAFETY FUNCTION DESCRIBED IN USAR
- o LICENSEE'S RESPONSIBILITY FOR DECISION
- o CASCADING OF OPERABILITY "IN OR OUT" OF TS
- o AMENDMENTS FOR SPECIAL CASES
- o APPROACH IN NEW STS

# FUNCTIONAL DIAGRAM OF TYPICAL ELECTRIC POWER SYSTEM

**SLIDE 1**

**SUPPORT SYSTEMS AND OPERABILITY**

**NOVEMBER 20, 1989**

**DR. CHRIS L. HOXIE**

**301-492-3138**

**TECHNICAL SPECIFICATIONS BRANCH, NRR**

**"FEATURES"**

**INCLUDES**

**SYSTEMS, SUBSYSTEMS, TRAINS,**

**COMPONENTS, OR DEVICES.**

## OVERVIEW

- A. CT OF A SUPPORT FEATURE
- B. CT OF AN "INDIRECT" SUPPORT FEATURE
- C. REQUIRED ACTIONS DUE TO SUPPORT  
FEATURE INOPERABILITY
- D. SUPPORT FEATURES NOT IN THE TS
- E. INOPERABLE SUPPORT FEATURE THAT  
DOES NOT PREVENT SUPPORTED FEATURE  
FUNCTION.

THE COMPLETION TIME (CT)  
FOR AN INOPERABLE SUPPORT FEATURE  
IS

MIN( CT OF SUPPORTED FEATURE 1,  
CT OF SUPPORTED FEATURE 2,  
. .  
CT OF SUPPORTED FEATURE N)

WHERE N IS THE TOTAL NUMBER  
OF SUPPORTED FEATURES.

## SUPPORT FEATURE

### ELECTRICAL POWER DISTRIBUTION SYSTEM

CT = ?

### SUPPORTED FEATURES

1. RHR PUMP (72 HOURS)
2. CIV ( 4 HOURS)
3. BATTERY CHARGER ( 2 HOURS)

## PHILOSOPHY

- 0 OPERATOR AID
  
- 0 SHORTEST CT WILL APPEAR IN THE TS  
WHERE THE TROUBLE IS.
  
- 0 OPERATOR DOESN'T HAVE TO SEARCH  
MULTIPLE LCOs TO SEE IF A SHORTER  
CT EXISTS.

## PROPOSED GUIDANCE A

A. WHEN A SUPPORT FEATURE IS INOPERABLE AND AN LCO FOR THAT SUPPORT FEATURE IS SPECIFIED IN THE TECHNICAL SPECIFICATIONS, THE COMPLETION TIME STATED IN THE SUPPORT FEATURE LCO TO RESTORE IT TO OPERABLE STATUS MUST NOT BE GREATER THAN THE MOST LIMITING COMPLETION TIME OF ALL THE FEATURES IT SUPPORTS.

## DIRECTNESS OF SUPPORT

- o **DIRECT SUPPORT**

  - ELECTRICAL POWER**

  - LUBRICATING OIL**

  - COOLING WATER**

- o **INDIRECT SUPPORT**

  - VENTILATION**

## AN EXCEPTION TO PROPOSED GUIDANCE A

- 0 INOPERABLE SUPPORT FEATURE, BUT INDIRECT SUPPORT
  
- 0 ALLOW SUPPORT FEATURE CT  
TO EXCEED SUPPORTED FEATURE CT
  
- 0 DURING INITIAL PORTION OF THE SUPPORT FEATURE CT,  
SUPPORTED FEATURES NOT DECLARED INOPERABLE.
  
- 0 MUST BE JUSTIFIED IN THE BASES BY SAFETY ANALYSES  
OR RISK-BASED ANALYSES.

## EXAMPLE

- o **SUPPORT FEATURE:  
VENTILATION SYSTEM (24 HOURS)**
  
- o **SUPPORTED FEATURE WITH MOST LIMITING CT:  
BATTERIES (2 HOURS)**
  
- o **22 HOURS BEFORE CASCADING  
INOPERABILITY OF VENTILATION SYSTEM  
TO THE BATTERIES.**

## PROPOSED GUIDANCE B

B. WHEN A SUPPORT FEATURE IS INOPERABLE AND IT DOES NOT DEGRADE THE CAPABILITY OF THE FEATURES IT SUPPORTS BELOW ACCEPTABLE LEVELS UNTIL SOME TIME LATER AS JUSTIFIED IN THE BASES FOR THE SUPPORT FEATURE, THEN INITIAL COMPLETION TIME SPECIFIED IN THE SUPPORT FEATURE LCO MAY EXCEED THE COMPLETION TIME OF ONE OR MORE OF THE FEATURES IT SUPPORTS.

THIS IS AN EXCEPTION TO THE DEFINITION OF OPERABILITY.

## PROPOSED GUIDANCE B

(CONTINUED)

IF THE SUPPORT FEATURE CAN NOT BE RESTORED TO OPERABLE STATUS WITHIN THE INITIAL COMPLETION TIME SPECIFIED, ALL SUPPORTED FEATURES INVOLVED SHALL BECOME INOPERABLE BY THE DEFINITION OF OPERABILITY AND THE ADDITIONAL COMPLETION TIME FOR THE SUPPORT FEATURE TO RESTORE IT TO OPERABLE STATUS MUST NOT BE GREATER THAN THE MOST LIMITING COMPLETION TIME OF THE FEATURES IT SUPPORTS.

**CONSEQUENCES OF  
AN INOPERABLE SUPPORT FEATURE**

o **CASCADING**

o **REQUIRED ACTIONS**

**FROM SUPPORT FEATURE LCO**

**FROM SUPPORTED FEATURES LCOs**

**REQUIRED ACTIONS  
OF SUPPORTED FEATURES LCOS**

**ALL REQUIRED ACTIONS FROM THE SUPPORTED FEATURES LCOS  
MUST BE ACCOMPLISHED EXCEPT THOSE THAT CAN NOT BE  
ACCOMPLISHED BECAUSE OF THE INOPERABILITY OF THE  
SUPPORT SYSTEM.**

## PROPOSED GUIDANCE C

C. ONCE A SUPPORT FEATURE IS DECLARED INOPERABLE AND ITS SUPPORTED FEATURES BECOME INOPERABLE BY THE DEFINITION OF OPERABILITY (EXCEPT AS INDICATED IN PROPOSED GUIDANCE B), THE REQUIRED ACTIONS SPECIFIED IN THE SUPPORTED FEATURES LCOs WHICH ARE NOT IMPACTED BY THE INOPERABILITY OF THE SUPPORT FEATURE MUST BE ACCOMPLISHED IN ACCORDANCE WITH THE COMPLETION TIME SPECIFIED IN THE LCO. ALL OTHER REQUIRED ACTIONS SPECIFIED IN THE SUPPORT FEATURE LCO MUST ALSO BE ACCOMPLISHED.

**INOPERABLE SUPPORT FEATURES  
THAT ARE NOT IN THE TS**

**LICENSEE HAS RESPONSIBILITY TO MAKE "PROMPT"  
DETERMINATION OF OPERABILITY OF ALL SUPPORTED FEATURES  
AFFECTED BY THE INOPERABLE SUPPORT FEATURE(S) AND TO  
TAKE APPLICABLE TS REMEDIAL ACTIONS**

## PROPOSED GUIDANCE D

D. WHEN A SUPPORT FEATURE IS INOPERABLE AND AN LCO FOR THAT SUPPORT FEATURE IS NOT SPECIFIED IN THE TECHNICAL SPECIFICATIONS, AND IF IT IS DETERMINED THAT SUCH A SUPPORT FEATURE WILL IMPACT SUPPORTED FEATURES LCOs SPECIFIED IN THE TECHNICAL SPECIFICATION, THEN ALL THE IMPACTED LCOs FOR THE SUPPORTED FEATURES MUST BE ENTERED.

## PROPOSED GUIDANCE E

E. WHEN A SUPPORT FEATURE IS INOPERABLE, REGARDLESS OF WHETHER OR NOT AN LCO FOR IT IS SPECIFIED IN THE TECHNICAL SPECIFICATIONS (TS), AND IF IT IS DETERMINED THAT THE SUPPORTED FEATURES GOVERNED BY THE TS ARE CAPABLE OF PERFORMING THEIR INTENDED FUNCTION WITH AN INOPERABLE SUPPORT FEATURE, THEN NO ADDITIONAL ACTION IS NEEDED IN THE SUPPORTED FEATURES TS.

**SLIDE 1**

**COMPLETION TIMES**

**NOVEMBER 20, 1989**

**DR. CHRIS L. HOXIE**

**301-492-3138**

**TECHNICAL SPECIFICATIONS BRANCH, NRR**

## COMPLETION TIME

- o DEFINITION
- o DOES NOT APPLY TO COMPONENTS
- o DOES APPLY TO "LEVELS OF DEGRADATION"

## CONDITION SUMMARY

## AC SOURCES - OPERATING

<u>CONDITION</u>	<u>DESCRIPTION</u>	<u>CT</u>
A	1 OS INOP	72
B	1 DG INOP	72
C	1 OS & 1 DG INOP	12
D	2 DG INOP	2
E	2 OS INOP	24
F	REQUIRED ACTIONS NOT COMPLETE WITHIN CT	

CT EXAMPLE 1

A. AT  $T=0$ ; OS 1 & OS 2 INOP

B. AT  $T=12$ ; OS 1 RESTORED

HOW MUCH TIME IS LEFT BEFORE  
PROCEEDING TO CONDITION F?

CT EXAMPLE 3

- A. AT T=0; OS 1 INOP
- B. AT T=12; OS 1 & OS 2 INOP
- C. AT T=24; OS 1 RESTORED

HOW MUCH TIME IS LEFT BEFORE  
PROCEEDING TO CONDITION F?

$72 - 24 = 48$

CT EXAMPLE 4

- A. AT T=0; OS 1 INOP
- B. AT T=12; OS 1 & DG 1 INOP
- C. AT T=18; OS 1 RESTORED

HOW MUCH TIME IS LEFT BEFORE  
PROCEEDING TO CONDITION F?

$$72-18=54$$
