DETAILED DEFINITION OF REQUIREMENTS

PART I

INTRODUCTION

1.0 GENERAL DISCUSSION

The Detailed Definition of Requirements (DDR) is the statement of "what" the Integrated Safeguards Information System (ISIS) must accomplish. This document is an evolving document to be amended and added to as the requirements of the U.S. Nuclear Regulatory Commission change. The Detailed Definition of Requirements should be maintained in a current and up-to-date form throughout the development and operational life of ISIS.

The DDR is concerned with the documentation of the safeguards information requirements. It is not concerned with "how" these requirements are satisfied. The technical considerations of system design and implementations can therefore be left to the "analyst." The DDR, in its concise, rigorous format, is the vehicle of communications between the users, who must validate the requirements, and analyst, who must determine how to fulfill those requirements.

It should be noted that the level of detail currently contained in the DDR is sufficient to bring ISIS to the general system design stage. Each additional phase of ISIS development should be accompanied by a corresponding analysis and further details should be supplied in order that the DDR can retain its communications vehicle posture.

Since the DDR is the statement of ISIS capabilities, periodic reviews of this document, performed by NRC personnel, will assure that ISIS will meet individual, as well as the collective requirements of NRC for safeguards information.

1.1 SAFEGUARDS INFORMATION REQUIREMENTS

NRC's safeguards information requirements are expressed in the DDR in terms of:

- What is the totality of S/G information currently needed by NRC?
- How are these data related to each other?
- How is the information to be reported?
- How are these data supplied?

Within the DDR, NRC's safeguards information requirements are expressed in the form of functional Service Modules (see Part II of DDR). Each of the Service Modules defines a set of Output Reports and Input Forms. The Data Base Composition documents the logical structure of the data to

be maintained within ISIS. Before the content of the Service Module Reports and Forms can be discussed in detail, it is necessary to introduce the major concepts employed to define the Data Base Composition.

1.2 DATA BASE COMPOSITION CONCEPTS

The ISIS DDR Data Base Composition represents the safeguards information requirements of NRC. These information requirements are expressed in terms of a "conceptual" data base. It consists of three basic components. The first component is called a "construct." A construct is defined to be an object, event, or other entity about which information is required. Safeguards-related examples of constructs are: REGION, SITE, and so on.

The exact information which is required to describe, define, or provide attributes of a construct is expressed in data elements, the second component of the conceptual data base. Data elements concerning the construct SITE, for example, are Site Name, Site ID, Address, Phone Number, etc. The technical definition of a "data element" as used in DDR methodology is: The smallest unit of information or data which is to be maintained, such that any update to this information is done by total replacement of the unit. For example, the data element "address" is required information about a SITE. Any address might consist of a number, street, city, state, and ZIP code. In order to modify the "city" portion of an address of a SITE, the entire new data element, consisting of the old number, old street, new city, old state, and old ZIP code would be entered.

The third component of the ISIS "conceptual" data base is called a "relationship." For example, a SITE is geographically located within a REGION. Expressed another way, a REGION has SITES located within it. This fact is expressed in the DDR Data Base Composition as a "relationship" between SITE and REGION. In this example, REGION is the "superior" construct and SITE is the "subordinate." That is, there may be many SITES within a given REGION. At the same time, a SITE can only exist geographically in one REGION. Thus, as used in the requirements definition, a "relationship" represents the fact that there is a physical, logical, or safeguards connection between two constructs. Each relationship is expressed twice: once from the viewpoint of the superior construct (REGION has SITES located within it), and once from the viewpoint of the subordinate construct (SITES are geographically located within a REGION).

The major advantage of using DDR methodology is that it provides a vehicle for expressing the safeguards information requirements of NRC in a rigorous and detailed manner. The DDR can be read and understood by both NRC personnel and ISIS system developers and remove the ambiguities which arise in a prose description of requirements.

For benefit of those readers who are familiar with data processing at the implementation level, it is important to note the following: although a construct might, in fact, be an ISIS record and a data element might be a field on this record, there is no requirement that this be so. The DDR does not specify records and fields of the data base requirement.

In summary, the Data Base Composition represents what information (data elements) is needed about what objects, events, or other entities (constructs) and what the safeguards connections are between these entities (relationships). The requirements analysis process identified a very large number of constructs, relationships, and data elements. In order to reduce the necessary complexity, the gathering and distribution of data have been grouped into safeguards-related functional areas called Service Modules. The concepts and methodology of Service Modules is discussed in the following section.

2.0 SERVICE MODULES

From the functional point of view, a service module provides the user a capability to obtain needed information. From the data base point of view, a service module primarily consists of a description of the outputs and inputs required by a user in a particular safeguards functional area. Ideally, inputs and outputs for a specific service module would correspond to each other without regard for other parts of the data base. In the case of ISIS, the data elements for reports in one module may be input by another module for quite another purpose. This poses no particular problems because they are linked by a common data base composition.

Thus, ISIS can be regarded as a collection of semi-independent subsets called Service Modules linked by a common data base. Service Modules are provided solely to aid in the user's comprehension of the system.

Each Service Module documented in the DDR is composed of: 1) textual description of purpose, statement of objectives, and users; 2) Output Reports; and 3) Input Forms.

The textual description of each Service Module will introduce the function being addressed by the Service Module, the potential users, and the objectives of the Service Module.

An ISIS output is a collection of information from the ISIS data base selected and processed in accordance with the documented rules. All outputs are called "Reports" even if their actual appearance on being output by ISIS is not a conventional report (e.g., tapes for other systems).

An ISIS input is a collection of data which will be used to update the data base. These inputs are called "Forms" regardless of whether their actual appearance or arrival to ISIS is on a conventional form.

Because of the integrated nature of the data base, it is possible that a Report might output a data element which did not come from one of the Service Module forms. Similarly, a form may contain data elements not used by this service module. However, in general, there is a correspondence, simply because the service module is concerned with a particular safeguards functional area.

2.1 OUTPUT REPORTS

Within the context of the ISIS system, "Output Reports" refers to any output. This may be a report listing or a magnetic tape. Each report contains a rigorous specification of which constructs are to be

selected and which data elements will appear in the report. The general format for output reports is:

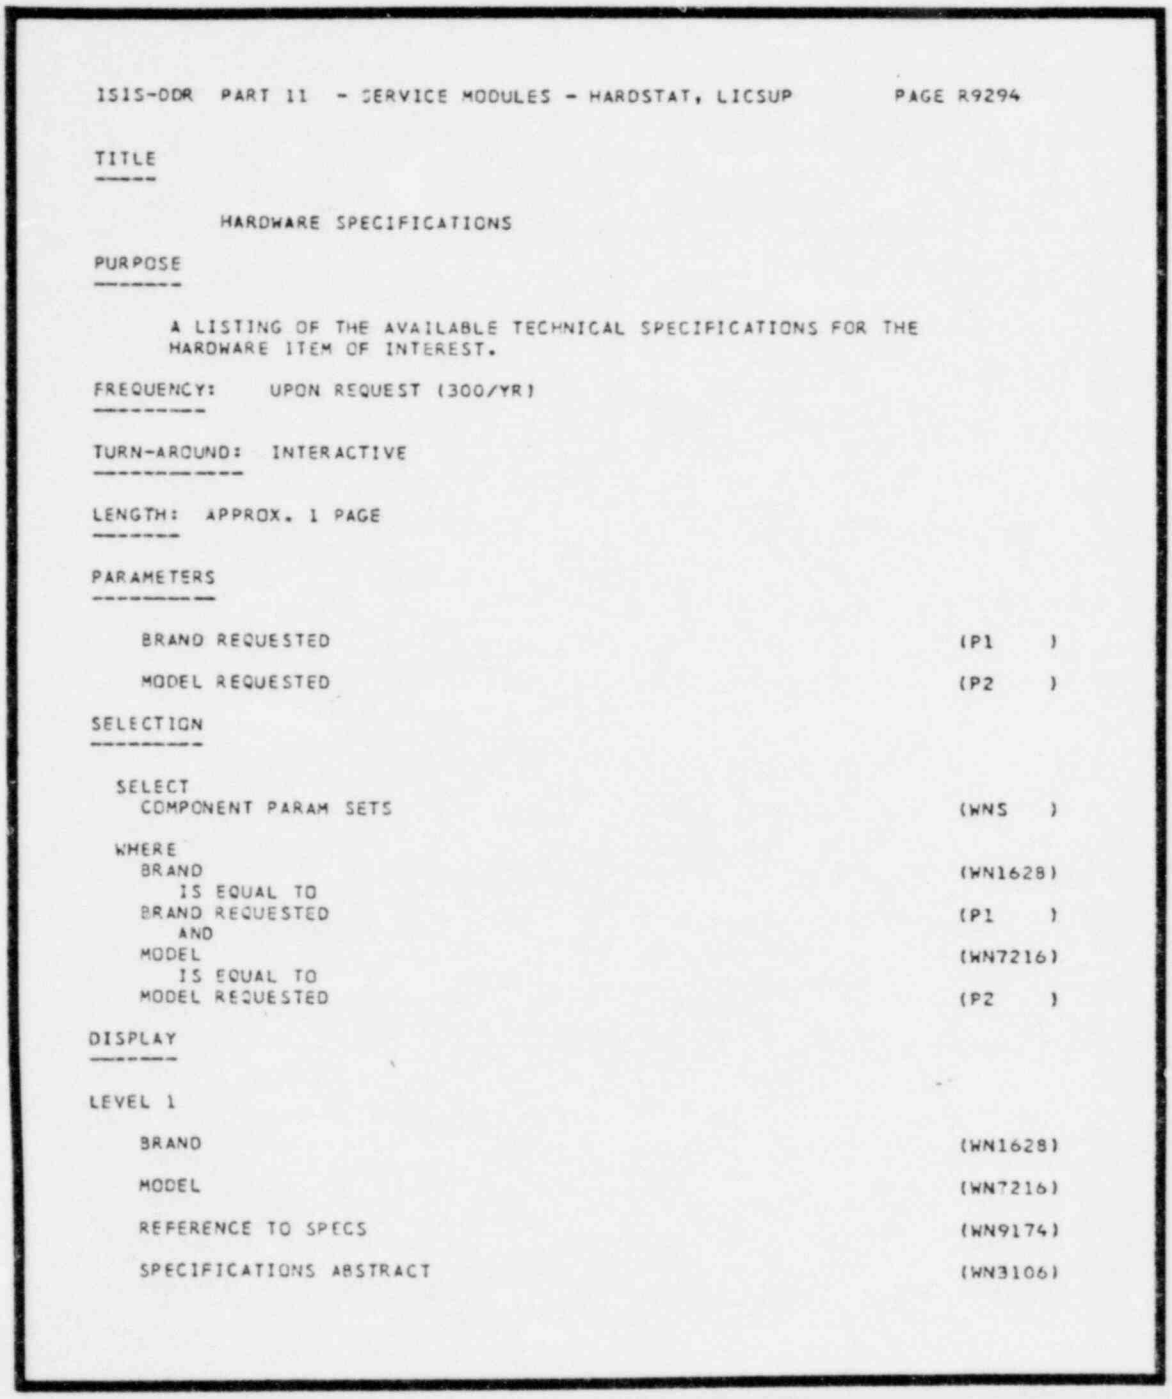
TITLE
PURPOSE
FREQUENCY
TURN-AROUND
LENGTH
PARAMETERS
SELECTION
DISPLAY
LEVEL N

Figure 2.1-1 is a sample of a report. Although this report is no longer a part of the selected system, all reports in Part II follow this format. The top line identifies the Service Module or Modules which require this report. In this example, two Service Modules are listed. This same report will appear in both Service Modules. On the right-hand ide the number R9294 refers to the ISIS identification for this report. This same Report ID would appear on all occurrences of this report, regardless of the number of Service Modules listed. TITLE indicates the name of the report. PURPOSE indicates the "intention" of the report.

The next three paragraphs: FREQUENCY, TURN-AROUND, and LENGTH are "design parameters." These data should be considered during the general design and will be even more important during detail design. A significant change in these estimates could have a great impact on system design.

The next three paragraphs combine to specify what will actually be produced when this report is asked for. An optional paragraph, CALCULATIONS, may be specified in reports for which data is needed which is a function of one or more data elements in the data base.

PARAMETERS are the user-supplied entries which, when compared (as shown in SELECTION) against values of specific data elements, determine which construct occurrences are to be selected. On the right side, in parentheses, are the DDR identifications for the parameters. These will always start with the letter "P" followed by a number. Each parameter may be a single value, a series of values, or the word "ALL" (unless otherwise stated). This means, referring to the example, that if two P1's and two P2's were entered, this would produce two reports - one for the first set of P1 and P2 and one for the second set (assuming



```

FIGURE 2.1-1 - SAMPLE OUTPUT REPORT

that the brand/model combinations exist in the data base). If the report request stated P1 = ALL and P2 = ALL, this report would be produced for every brand/model contained in the ISIS data base.

The SELECTION paragraph indicates which occurrences of which constructs are to be selected from the data base and the criteria for the selection. These always take the form: SELECT constructs WHERE condition. Note that SELECT and WHERE are "keywords" not constructs. The right-hand side, again, shows the ISIS identifications for the constructs, relationships, data elements, and parameters.

The SELECTION section is simultaneously a statement of information requirements as well as further detail in the design of that report. This requirement/design insures that the necessary data, constructs, and relationships needed to prepare a specific report are in fact a documented part of the data base.

The DISPLAY paragraph indicates which exact data elements from the selected constructs are to appear on the report. The DISPLAY paragraph is further divided into "levels." "Level 0" although not shown on the display will always contain:

- security classification on each page;
- numbers for each printed page;
- title page containing
  - report ID and title;
  - report date;
  - non-disclosure statement (if appropriate);
- list of input parameters.

The levels of the report indicate a hierarchical structure and sort criteria. In the given example only one level is specified. This indicates that the given data elements will appear only once for each set of parameters. If two sets of parameters are given, the output would be sorted in order by BRAND, MODEL, REFERENCE..., and SPECIFICATIONS.

If additional levels are specified, they can be thought of as repeating groups within the level above them. For example:

```
DISPLAY

LEVEL 1

    BRAND

    MODEL
```

LEVEL 2

SERIAL NUMBER

SITE ID

LEVEL 3

EVENT NUMBER

EVENT DATE

This sample indicates that for each selected BRAND/MODEL there will be a list of components by SERIAL NUMBER and corresponding SITE IDs. Then, for each such component, list the EVENT NUMBERs and EVENT DATEs of events the particular component of this brand model was involved in.

2.2 INPUT FORMS

"Input Form" refers to any data which arrive in the ISIS system which are used to add, modify or delete information in the ISIS data base. The DDR descriptions of Input Forms annotate the data required as input to ISIS, not the means of input (e.g., punched cards, magnetic tape, etc.).

The general format for input forms is:

TITLE

PURPOSE

LEVEL N

UPDATE KEYED BY DATA ELEMENT

REFERENCE

OTHER IDENTITY DATA

IDENTITY RELATIONSHIP

DATA RELATIONSHIP

OTHER DATA

LEVEL N is used to indicate repeating groups. That is, there may be any number of LEVEL 3 occurrences for a given LEVEL 2. This concept is analagous to the levels in the DISPLAY paragraph of the Output Reports. Successive levels in Input Forms indicate subordinate levels. As with Output Reports, there is an implied Level 0 on all Input Forms. This Level 0 contains a code to specify "ADD," "MODIFY" or "DELETE." Each LEVEL must begin with one of the two "key words" UPDATE or REFERENCE followed by a construct title. UPDATE is used if the construct mentioned can be updated by this form. REFERENCE is used to indicate that the construct cannot be updated by this form, but is needed for identification purposes. OTHER IDENTITY DATA is used to enter any additional data elements other than "KEYED BY" data elements required to uniquely identify the construct.

IDENTITY RELATIONSHIP is used to specify a mandatory superior relationship. That is, a relationship which must be identified in order to update a construct. For example, in order to add a COMPONENT, the relationship "belongs to a COMPONENT GROUP" is mandatory and the new COMPONENT cannot be added without the GROUP being specified.

DATA RELATIONSHIP is used to specify a relationship which is not mandatory, but may be present. For example, when an INSPECTION OBSERVATION is about a specific COMPONENT the relationship "INSPECTION OBSERVATION may apply to COMPONENT" should be built by this input form. If the OBSERVATION were not about a COMPONENT, the relationship would not be included. The OTHER DATA paragraph is used to indicate which data elements in the "UPDATED" construct may be included on this form (in addition to the KEYED BY data elements).

As with the Output Reports and Data Base Composition formats, the right-hand side of the Input Form contains ISIS identifications for the constructs, relationships, and data elements.

An example of an Input Form is shown in Figure 2.2-1. This form is used to add, modify, or delete information about LLEA Agreements (no longer a part of the selected capability). The top line indicates the Service Module which is responsible for the form along with the ISIS Form ID. Next, the TITLE and PURPOSE explain the intent of the form. Note that there is only one level to the form. That is, there are no subordinate constructs which will be updated by this same form.

The remainder of the form indicates that one LLEA AGREEMENT will be stored (or updated or deleted) by identifying the SITE and the INTERFACING ORGN to which this agreement pertains. The two data elements, DATE OF INITIATION and DATE OF EXPIRATION are the only data elements which this particular form can maintain. It can also maintain the two relationships, "relates to an INTERFACING ORGN" and "relates to a SITE."

3.0 DATA BASE COMPOSITION

Part III of the DDR Data Base Composition rigorously describes the constructs, relationships, and data elements which make up the ISIS data base. A diagramming technique has been employed to assist in visualizing the content of the Data Base Composition. The "Data Base Diagram" is shown in Part III of the DDR. Each construct listed in the DDR corresponds to an oval on the Data Base Diagram. Each relationship, expressed in words in the DDR, corresponds to a line between two ovals on the diagram. In addition, these descriptions show the actual data elements by construct for which information is to be maintained.

Figure 3.0-1 shows a sample page out of the Data Base Composition. The right-hand side of the page contains construct IDs, relationship IDs and data element IDs.

The remainder of each page is fairly self-explanatory. The construct name (both singular and plural forms) is listed first, followed by:

- relationships to superior constructs;
- relationships to subordinate constructs;
- data elements.

Some of the constructs and data elements have descriptions or notations which can be found indented under the appropriate name. The sample page, Figure 3.0-1, follows this format. It is page Number 474 in the Data Base Composition. The construct name is INSP/INVESTIGATION, and its purpose, as indicated, is to record the occurrence of an on-site inspection/investigation. The volume figures given are used in the design process, and are not critical to the understanding of the definition of safeguards requirements.

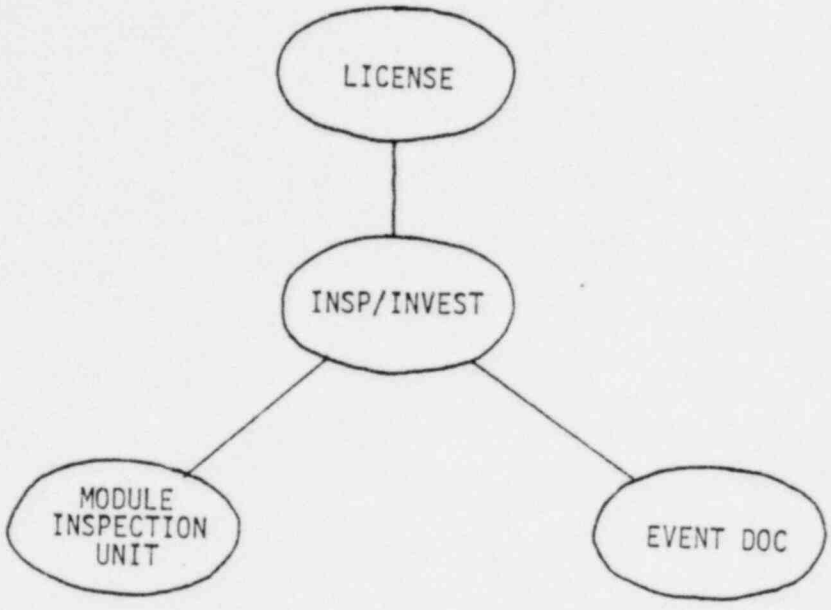
Figure 3.0-1 Data Base Composition Sample

The "relationship" paragraphs indicate that this construct has one superior relationship and two subordinate relationships. Diagrammatically:



This structure may be found in context with the total logical data base diagram in PART III of this Appendix. Note that the expressions of the subordinate relationships use the plural form of the construct name, consistent with the concept that an owner (superior construct) may own multiple occurrences of a subordinate construct.

In the "data elements" paragraph is a list of data elements contained in this construct. In this case, there are several data elements that will be kept concerning an INSP/INVESTIGATION. Note that the number of the particular license involved is not indicated as a data element. This is obtained through the established superior relationship, in accordance with the concept that an occurrence of a construct has only one applicable occurrence of a superior construct. Note also that if other information concerning superior constructs is desired, such as their data elements or relationships to other constructs, each construct must be located separately in the data base composition.

3.1 DATA BASE COMPOSITION METHODOLOGY

Having initially postulated an ISIS data base compositon at the construct/relationship level, the analyst proceeds to document the data

elements under the following restrictions:

- no repeating data;
- no duplicate data.

"No repeating data" means that there are no data elements or groups of data elements which contain multiple values. For example, if each licensee could have one and only one license, then the data element "license number" could be stored in the LICENSEE construct. However, since licensees may be granted many licenses, it is necessary to define another construct LICENSE which is subordinate to LICENSEE. The data element "license number" will now be stored in the construct LICENSE. Each occurrence of the construct LICENSE will have only one "license number" data element but there may be any number of occurrences of LICENSE associated with a single LICENSEE construct occurrence.

"No duplicate data" means that the same data values are not stored in different constructs. Using the same example, if the data element "license number" is stored in the LICENSE construct, then that construct is the only construct containing that information. Any Output Report or Input Form requiring a "license number" must access the construct LICENSE to obtain that data. For the benefit of data processing experts, note that this does not restrict duplicate data from occurring in ISIS physical data base. This is a decision to be made later based on technical/performance/cost considerations.

3.2 SPECIAL CAPABILITIES

Because of the complex nature of NRC safeguards data, several special capabilities have been added to the requirements definition methodology to make the DDR more useful:

- cataloged constructs;
- historical data;
- subconstructs.

Cataloged constructs are constructs in which many occurrences of a single construct are all related through a hierarchy.

Historical data are data elements of a construct, the values of which are to be retained when replaced.

Subconstructs are collections of data elements which apply to a construct only if it is of a certain type. For example, components have

data elements which apply only if the component is a piece of measurement related (material accounting) equipment.

3.2.1 Cataloged Constructs

The purpose of catalog capability is to provide NRC with the capability to dynamically create construct hierarchies without system design changes. The data elements associated with a cataloged construct are stored in that construct. The construct hierarchy is stored in the construct CATALOG ENTRY. For example, the construct LICENSE TEXT is cataloged. Many occurrences of the LICENSE TEXT construct may be required to completely store the references to the sections of a single license. There is a hierarchy associated with the text of the license in that the license as a whole may be divided into plans, each plan into sections, each section into subsections, each subsection into paragraphs, etc.. . . There may be one occurrence of the LICENSE TEXT construct for each paragraph in the license. The hierarchy stored in the CATALOG ENTRY construct would identify for each paragraph the corresponding subsection, section, plan, license. If another construct owns a cataloged construct then it simultaneously owns the entire hierarchy. If a cataloged construct owns another construct, then all constructs upward in the hierarchy also own the given construct.

3.2.2 Historical Data

The ordinary update action of ISIS is to replace an existing value of a data element with a new value, resulting in loss of the old value. In general, this is desirable as it is very confusing and burdensome to keep a complete history of all data.

However, in certain cases, it is required that the old values be retained. For example, if a possession limit changes, the old value still applies to material possessed in the past. Similarly material inventory data needs to be kept.

For this reason, the capability exists to identify data elements in the data base composition as historical, grouping them under an effective date. An update which does not specifically name an effective date will result in the addition of a new set of data with effective date of "today."

Any constructs stored subordinate to a construct with historical data will, in lieu of instructions to the contrary (an effective date specified), be stored subordinate to the latest values.

Similarly, in the case of output, only the most recent set of data will be referenced unless the effective date criterion is added.

3.2.3 Subconstructs

The purpose of defining subconstructs is to achieve the benefit of commonality between like constructs while not losing sight of their uniqueness. A subconstruct has no identity, normally, distinct from the construct identity. It does not "repeat," and hence no ambiguity exists with respect to input or output.

For example, the construct COMPONENT TYPE has as one of its subconstructs, VEHICLE TYPE. This means that:

- some safeguards components are types of vehicles;
- a vehicle type is a component.

At the construct level are recorded all data elements and relationships in common between a vehicle type component and all other component types (also represented as subconstructs; e.g., CONTAINER TYPE, PERSONNEL TYPE, etc.). At the subconstruct level are identified all data elements and relationships which are unique to vehicle types of components.

3.3 DATA BASE TERMINOLOGY

The following is a list of some terms used in the preceding discussion, and to be used later, defined briefly, and in alphabetical order:

1. Cataloged Construct - A construct having an internal hierarchy defined in each individual case by input to ISIS.
2. Computation - A function performed on specified data units.
3. Computational Result - A data unit produced by ISIS as a function of other data units.
4. Construct - An entity about which data are maintained, presumed by ISIS to exist and have characteristics in accordance with the transaction received to date.
5. Cross-reference - A relationship in which both constructs function as both owner and member.
6. Data Element - A data unit which describes a construct.
7. Data Unit - A numeric value, date, or textual datum which is processed as a unit.
8. Form - An input to ISIS.

9. Function - A formula or translation used in computations.

10. Historical Data - Data which should be retained in active status when replaced.

11. Member - With respect to a given relationship, the member is the multiple occurrence construct.

12. Owner - With respect to a given relationship, the owner is the single-occurrence construct.

13. Parameter - A data unit provided by the user that identifies or bounds the information requested on output or provided on input.

14. Report - An output from ISIS.

15. Selection - The process of deciding what data is to be output.

16. Service Module - A subset of the ISIS forms and reports; a subset of ISIS capability that serves a particular safeguards information requirement.

17. Subconstruct - A data element set which is applicable to the construct only in certain cases.

18. Transaction - Another term for forms. A transaction is a unit of input with a single intent. For example, to report that an inspection took place or that a shipment occurred.

DETAILED DEFINITION OF REQUIREMENTS

PART II

SERVICE MODULES

INSPECTION PLANNING (INSPLN)

1.0 ABSTRACT

The Inspection Planning Service Module, INSPLN, will provide to the inspectors in the regions a set of reports which will be useful to them in planning for the inspection of a specified I&E manual chapter (inspection module) at a particular location.

INSPLN will include a historical report indicating the licensee's previous performance in meeting the standards associated with a particular inspection module. A reported history of clear inspections or, at the other end of the spectrum, inspections which included items of deviation and/or noncompliance, should alert the inspector to the situation he might expect to find at the facility. He must also be informed concerning corrective action status.

A second report in INSPLN will provide up-to-date information on the appropriate parts of the license and license conditions. A license status report will indicate dates of licensee/license work flow revisions so that the inspector can make his plans, confident that he is using up-to-date information and that he is interpreting the historical report in the proper light. A third report will list license-specific inspection details. Thus, the inspector can be assured that his plan is based on the most current version of the license and license conditions and that his review of those documents is comprehensive.

A fourth report included with INSPLN has to do with inspection items. It will list items still to be inspected for a specified inspection module under a specified license.

2.0 PURPOSE OF INSPLN

2.1 FUNCTIONS AND CAPABILITIES

The purpose of INSPLN is to provide inspectors with license-specific and general information needed to plan for a scheduled inspection. It supports the safeguards-related functions identified in the organizational-information requirements analysis reported in Sections 2 and 4 of the ISIS Phase I Report. INSPLN should expedite the planning for an inspection by providing much of the background information automatically, using the comprehensive information that is currently available.

INSPLN will be able to make use of automated data sources which can in turn be used to generate reports indicating license status, licensee performance, and inspection guidance documents. The expanding requirement for OIE to inspect the compliance with a license and with license conditions increases inspection loads, and it is projected that the need to document, assimilate and distribute both data and information throughout NRC will also grow. In addition, the need is developing to: (1) be aware of trend indicators, and (2) use the results of inspections in technical site-specific safeguards effectiveness evaluation. INSPLN will relieve some of the administrative planning which must now be done by hand, from experience and knowledge. It will also assure uniform excellence in the planning process as an aid to more effective inspections.

In the sense that it will relieve some of the inspection preparatory work, INSPLN will serve to help the inspectors in their inspection review, evaluation, and recommendation functions.

2.2 CURRENT OR PROJECTED INFORMATION NEEDS

The support to be provided by INSPLN will serve current needs, as indicated by information work sheet comments from OIE and Regional Offices reported in Section 4.1 of the Phase I ISIS Report. INSPLN also will satisfy a future need to provide automated inspection planning support. That support should allow continued excellence of the inspection program, while at the same time freeing a portion of the inspectors' schedules to take advantage of their ability to provide carefully considered evaluation of inspection results. INSPLN will also provide a vital service to inspectors if the inspection work load per inspector should increase as a result of nuclear industry growth.

The data needed as input to the reports which together constitute INSPLN would ideally be available from automated sources. In some cases, such sources already exist. The I&E inspection module historical report for

a particular facility is, in large part, to be constructed from information currently processed through the inspection reporting (766/766S) system on the NIH computer. The textual inspection reports, evaluation memos for an inspection, PNs and LERs could also constitute part of the historical reports, but are not currently part of an automated system. The license status report of INSPLN would provide license-specific data such as dates of the licensee physical security or material control and accounting plans, as well as the status of changes in progress.

3.0 RELATION OF INSPLN TO EXISTING NRC SYSTEMS

The statistical data reporting system (766 computer system) on the NIH computer will supply much of the data needed to construct the inspection module historical report for a specified facility.

The 766 numbering system can be used in part to identify the files needed, since it includes the docket number (license number). To be used in the mode envisioned for INSPLN, the specific inspection module inspected must be code-entered so that historical data for that type of inspection can be extracted from the 766 data base. The same requirements exist in terms of identification and access to data input to the 766 computer system data base by the form 766S. (See ISIS Phase II Report for further details on the 766/766S system.)

INSPLN relates directly to an automated system being developed in the NRC regional offices, the Outstanding Item List (OIL). This system lists for inspectors those inspection items flagged on previous visits, or on incompleted modules. In order to best provide the INSPLN/OIL capability, some new data elements will be needed on the 766/766S forms.

4.0 NRC OFFICES INVOLVED IN INSPLN

4.1 REPORT USERS

The inspector at the regional level will be the user of the INSPLN Service Module reports.

4.2 INPUT RESPONSIBILITIES

Data to be stored in the INSPLN data base constructs will be generated and input by: (a) the 766/766S computer system, (b) ONMSS for licenses (dates and status) not reactor-related, (c) ONRR for reactor-related licenses, and (d) OIE Headquarters for I&E manual chapter status.

4.3 DATA QUALITY

Since INSPLN does not have its own input data, no question of input data quality arises.

4.4 ACCESS CONTROL

OIE Headquarters and appropriate regional offices should have access control over those portions of INSPLN which are classified or sensitive (proprietary).

5.0 MODULE DATA BASE

Figure 5.1 shows the fourteen (14) constructs which are accessed to produce the four reports. This module does not create any update of any constructs.

INSPECTION SCHEDULING ASSISTANCE (INSKED)

1.0 ABSTRACT

This module will provide reports indicating the status of all of the inspection modules for each facility and the dates by which each of these modules must be completed.

These reports will be generated on demand and will provide several options on form, content and time period. The reports may cover all licensed facilities, the facilities under jurisdiction of a particular region, or one particular facility.

2.0 PURPOSE OF INSKED

2.1 FUNCTIONS AND CAPABILITIES

The purpose of this module is to provide the visibility required by the person in each region responsible to generate and maintain a schedule of licensee inspections.

2.2 CURRENT OR PROJECTED INFORMATION NEEDS

Currently, the personnel directly involved with the generation and maintenance of inspection schedules varies from region to region. Generally, individual inspectors are assigned prime responsibility for certain sites and are responsible for generating inspection schedules for those sites. These individual schedules are then compiled into a monthly schedule by one person responsible for the maintenance of that schedule. At this point, the section chiefs provide their input and the Safeguards Branch Chief has the ultimate approval responsibility for the schedule and any major changes. In practice, the schedule changes almost daily.

The information to be made available to the scheduler is captured in the Module Tracking System (MTS) section of the NRC 766 forms. This information will provide the status of each of the inspection modules and the effort required to complete them.

The NRC requirements relative to inspection frequencies will be coupled with the above information to identify those modules which are in danger of not being completed within the time period specified by NRC.

As stated above, the data required for this module are captured on the NRC 766 forms. No new forms or data input requirements need be imposed on either the licensee or regional personnel for the INSKED Module.

3.0 RELATION OF INSKED TO EXISTING NRC SYSTEMS

Currently, inspection scheduling visibility is provided by means of a large magnetic or otherwise changeable display board normally hung in the safeguards branch chief's office. This board displays inspections that have been performed for each licensee over the past two or three years. Facilities milestones and other pertinent information are also displayed on this board.

This is a very useful scheduling aid and it also provides the safeguards branch chief with visibility on the status of all inspection activity at the facilities under his jurisdiction. The inspection scheduler also uses this board.

The Inspection Scheduling Assistance Module would not replace the board but would augment it and provide the information required to update the board. Further, the information from this module will be available to the Headquarters personnel charged with the responsibility of assessing the safeguards inspection program and recommending changes to procedures and policies to improve the efficiency and effectiveness of the inspection process and the total inspection program.

The Module Tracking System (MTS), which is no longer in use, was designed to perform similar functions as INSKED. Its demise was caused by (among other things) lack of flexibility, unnecessary reporting capability, a combersome data input requirement and very difficult data correction procedures. The MTS capability is being redesigned and implemented by OIE Headquarters. If the new MTS is successful, it may be incorporated into this ISIS service module.

4.0 NRC OFFICES INVOLVED IN INSKED

4.1 REPORT USERS

This module will be used by:

- The person in each NRC Regional Office who is responsible for the generation and maintenance of a schedule of safeguards inspections of the facilities under its jurisdiction;
- The regional safeguards branch chief who is responsible for the overall safeguards function for the region;
- OIE Headquarters personnel responsible for monitoring and evaluating the total safeguards inspection program.

Both NRC Headquarters and Regional Office personnel identified needs for INSKED reports data on their information work sheets during the requirements analysis; these comments are provided in Section 4.1 of the ISIS Phase I Report.

4.2 INPUT RESPONSIBILITIES

The major part of the data required for this module will be provided by the inspectors and investigators in each region. The MTS section of the 766 forms which are completed by the principal inspector for each inspection trip provide the data required for the inspection module status report. The NRC requirements pertaining to the frequency of inspections will be a source of data for the report of those inspection modules which must be completed within a specified time frame.

4.3 DATA QUALITY

The regional inspector will continue to fill out the 766 and 766S Forms. The regional MIS coordinator will be responsible for data entry and is the interface between the 766 system's edit procedures and the inspector. Once validated, the 766 master files will be processed by ISIS to update the data base constructs vis-a-vis the 766 system.

4.4 ACCESS CONTROL

Headquarters will have access to the data and should control any access to it from outside OIE. Data relating to unannounced inspection schedules are clearly sensitive and may be classified.

5.0 MODULE DATA BASE

Figure 5.1 shows the thirteen (13) constructs which are accessed to produce the INSKED reports.

LEVEL 1

UPDATE
INSPECTION PROGRAM (LN)
KEYED BY
MANUAL CHAPTER NUMBER (LN0187)

OTHER DATA
INSPECTION PROGRAM TITLE (LN6523)

COMPARABLE EVENTS HISTORY (CEHIST)

1.0 ABSTRACT

CEHIST will enable an analyst to search for common attributes among the total collection of reports, letters and memos generated as a result of safeguards-related problems, incidents, or events. Included in this collection will be Licensee Event Reports (LERs), Preliminary Notifications (PNs), Evaluation Memos, Inspection Reports, Investigation Reports, and Incident Reports. The desired information will be extracted in successive iterations of reports which converge on any particular subject of investigation. Concurrent with this activity will be the development of a list of pointers to the full text of reports, letters, and memos pertinent to the subject. Retrieval of these documents will be accomplished via an interface to a planned microfiche document retrieval system (DCS).

2.0 PURPOSE OF CEHIST

2.1 FUNCTIONS AND CAPABILITIES

CEHIST will store and maintain preselected attribute data from the PNs, Evaluation Memos, Inspection Reports, Investigation Reports and Incident Reports so that retrievals can be made based on the values of the attributes. Retrievals will also be made from the established LER and NRC 766 and 766S files which are already stored in a format that facilitates searches based on attribute values.

CEHIST will also interface with a planned document retrieval system (DCS) to access full texts of any of the documents pertinent to an analyst's investigation.

The intent of CEHIST is to facilitate searches through safeguards-related reports, letters and memos for similar or related problems, abnormal occurrences, incidents, etc. This capability is required by analysts charged with investigating chronic or potential safeguards problems or weakspots and recommending changes in hardware, procedures, or standards to remedy the problem. Trend data is also obtainable through the CEHIST searching capability. Additional batch reports can be generated on an as-needed basis for historical or statistical studies of facilities, events or safeguards items or procedures.

One of the uses of CEHIST would be to provide special data to inspectors preparing for an inspection. A query requesting historical non-compliance data for the facility to be inspected will help to prioritize the emphasis to be given to certain safeguards items during the inspection. In a more thorough preparation, the inspector may wish to cross-check given noncompliance items with experience in other similar facilities throughout the country. CEHIST will assist him in this analytic activity.

Investigators will go through the same process in their investigation of an incident or a problem. In addition to providing information regarding similar incidents or problems, CEHIST will point to the principal investigator. Consultations with investigators who have worked on similar cases are ar invaluable aid in resolving safeguards problems in a consistent manner.

Personnel responsible for the overall safeguards program in the various offices of NRC will utilize CEHIST to assist in searching for and gathering as much historical information as possible which bears on a policy, procedure or item related to safeguards. Standards development and modification functions require as much historical information as possible in order to ensure that standards are realistic and modifications are truly warranted.

The development of contingency plans must be tempered by what has taken place historically in order to place the proper emphases on the types of incidents that actually do occur. CEHIST will provide insight into actual and potential occurrences in the country. This information would be integrated to aid in the formulation of a realistic set of input parameters describing threat scenarios that can be input to the effectiveness evaluation models.

CEHIST reports can also highlight those safeguards components or procedures that present chronic problems. After regulations, standards and/or procedures are modified to eliminate these problems, the same kinds of CEHIST reports can be used to measure the effect of the modification.

CEHIST will also be used in the licensing support functions. License change requests must be assessed partly by the historical record of that portion of the license for which the request is made. This also applies to requests for exemptions from specific regulations. CEHIST will also point to specific areas that would need careful scrutinizing during the license application approval process.

Finally, the iterative process of improving the effectiveness of safeguards inspections suggests de-emphasizing the inspection items which never show noncompliance in order to provide more time to inspect the items that require more emphasis according to the noncompliance historical data. By being aware of the frequency of occurrence of various incidents and events through CEHIST, steps can be devised to minimize their occurrence.

2.2 CURRENT OR PROJECTED INFORMATION NEEDS

CEHIST meets current NRC needs identified by the requirements analysis performed in the ISIS Phase I. These needs have been discussed above in Section 2.1. CEHIST also meets some projected needs, for example, those of the threat assessment analysts who can use it to determine if trends are developing in types of abnormal events in order to develop new threat models or contingency plan stimuli.

3.0 RELATION OF CEHIST TO EXISTING NRC SYSTEMS

Currently, the capabilities of the total CEHIST Service Module do not exist. In a limited sense the MARK IV Data Management System does provide the capabilities to design reports and extract information from the structured LER and NRC 766 files, but not from the others.

The LER file maintained by the Office of Management Information and Program Control is highly formatted and the information is extractable using the report-defining capabilities of MARK IV. The LERs can be categorized, sorted and/or extracted by any number of predefined attributes.

Like the LER file, the 766 and 766S files are highly formatted and specific inspection information can be extracted in any number of ways by using the standard reporting capability already existing or by designing a new report through the capabilities of MARK IV.

The other files are not so structured. A sizable staff will be required to extract the key attributes from the text of Preliminary Notifications, Investigation Reports, Evaluation Reports and other reports that are evaluative but primarily textual in nature. They will be used in the analysis and evaluation of safeguards procedures and equipment.

4.0 NRC OFFICES INVOLVED IN CEHIST

4.1 REPORT USERS

CEHIST will be used by the inspectors in the regions in preparation for an inspection trip. The reports will show them where some safeguards procedures or items require special attention during the inspection. The need for this type of data was documented on the Information Worksheets as described in Section 4.1 of the ISIS Phase I Report.

CEHIST will also be used in the NRC OSD, ONMSS, ONRR (Reactors), RES (Research) and OIE Headquarters in developing answers to congressional inquiries or analyzing trends and determining requirements for new/modified regulations/regulatory guides that cover identified safeguards problem areas.

4.2 INPUT RESPONSIBILITIES

The input for CEHIST will come from many sources. There are systems in existence that are performing parts of the functions defined in CEHIST. The LER file exists today and it is highly formatted for selective data retrieval. LERs are generated by the licensees. It is projected that submission of safeguards-related LERs will be made more timely.

The NRC 766 and 766S forms capture much of the information from inspections and investigations, but the textual part of an investigator's report is unstructured and no standards exist for its contents or format. Key attributes must be extracted from these reports.

Preliminary Notifications (PN) are partially structured. The forms must be modified to extract more of the data that normally enters the textual portion of the report. PNs and 766s are generated in the regions and therefore would require added regional support.

4.3 DATA QUALITY

The licensees are responsible for the accuracy of the LER data. The Office of Mangement Information and Program Control maintains the LER files and is responsible for the generation of the reports from them.

Personnel in the regions are responsible for the accuracy of the 766 and 766S forms, inspection and investigation reports, PNs and Evaluation Reports.

4.4 ACCESS CONTROL

Since much of the data in the constructs supporting this module are sensitive, strict access controls will be established on the use of the module. Access from without NRC will be controlled by OMPA and OIE.

5.0 MODULE DATA BASE

Figure 5.1 shows the twenty-two (22) constructs which are accessed to produce the CEHIST reports. The CEHIST constructs allow information to be stored in the ISIS data base to categorize, record and document abnormal events involving safeguarding nuclear facilities or material shipments.

SPECIFICATIONS ABSTRACT (WN3106)

MATERIAL ACCOUNTING (MAC)

1.0 ABSTRACT

As part of its charter, the Nuclear Regulatory Commission is responsible for safeguarding nuclear material against diversion or unauthorized use. A major part of the NRC program designed to fulfill this responsibility involves nuclear material accounting. The Federal Code of Regulations requires that any individual, corporation, or institution authorized by license from NRC, or an agreement state, to possess special nuclear material, must report to NRC on a repetitive basis the location and quantities of SNM currently in the licensee's possession (currently physical inventory NRC 742 forms). Additionally, licensees must report any transfers of SNM between authorized possession areas which have been assigned Reporting Identification Symbols--RISs (currently material transfer NRC 741 forms). The licensee must provide NRC information about nuclear material types and quantities as well as transportation routing data for each transfer of special nuclear material.

The Material Accounting Service Module (MAC) is that part of ISIS which is responsible for inputting, editing, verification, storage, and reporting of all nuclear material inventory and transfer data reported to NRC. The data captured by the MAC module encompasses all aspects of the nuclear fuel cycle. The data currently reported to NRC which will be processed by MAC includes:

- Material acquisition (owner accounts)
- Material transformations (transmutation, decay, or fission)
- Material use (material type/composition codes)
- Material losses (normal, measured, accidental)
- Material transfers (book or physical movement)
- Material unaccounted for/inventory differences (MUF/ID)
- Limits of error.

The currently employed concept of maintaining separate book and physical material inventories is embodied in the requirements of the MAC module.

Additionally, MAC produces a variety of user-oriented reports. A partial list of the capabilities provided by the MAC reports includes:

- Calculation of daily book balances for each ICA/MBA.
- Comparison of reported limits of error with error measurement capabilities specified in the licensee's material accounting plan.
- Comparison of reported material possession with authorized possession limits.
- Retention of historical records to allow trend analysis and shipper-receiver differences analysis.
- Trigger-level reporting of increasing ID and measurement error trends.
- Preparation of nuclear material data for reporting to IAEA.
- Provide to licensees a record of all data which has been reported by the individual licensee and processed by MAC for storage in ISIS.

2.0 PURPOSE OF MAC

2.1 FUNCTIONS AND CAPABILITIES

The Material Accounting Module (MAC) must satisfy two goals:

- Provide the capability to satisfy all of the NRC current informational needs regarding SNM accounting data.
- Provide the flexibility to evolve as the regulatory environment evolves.

MAC is intended to provide special nuclear material (SNM) accounting information to the NRC on a regular basis. The SNM information will be both current and historical. Because of the basic supporting role of the material accounting data, MAC provides data to nearly all of the NRC offices with the major users being the Office of Inspection and Enforcement and the Office of Nuclear Material Safety and Safeguards. The materials considered to be of interest to NRC are listed in MAC Table 1.

MAC TABLE 1

MATERIAL OF INTEREST TO NRC AND IAEA

Normal Uranium
Depleted Uranium
Thorium
Enriched Uranium (U^{235})
Enriched Uranium (U^{233})
Plutonium
Plutonium (Pu^{238})
Tritium

All data entered into MAC will be in the form of transactions. MAC Table 2 lists the transactions that will be reported on the RIS level (MAC module is capable of evolving to an MBA/ICA reporting level if necessary). As indicated in Table 2, MAC supports item transactions. An item transaction will only require the item number after the initial entry of the item description.

MAC TABLE 2

REPORTABLE TRANSACTIONS

Degradation to another material
Formation from another material

Transmutation
Decay
Fission

Normal Operating Losses
Measured Discards
Accidental Losses

MUF
LEMUF

Item Transfers
Item Changes

"Batch" Transfers
"Batch" Changes

Owner Transactions
Country of Origin Transactions
Utility Account Transactions

Physical inventory data will also be reported as transactions (i.e., MUF, measured discards, accidental losses, etc.). Once the physical inventory data are in (within at most 30 days of the inventory), MAC will generate a report to the licensee listing the material at his plant which he must confirm as correct or provide correction transactions to resolve discrepancies. The report lists all transactions since the previous inventory, as well as a detailed listing of location of materials at physical inventory time. Cycle time for correction will be limited and subject to enforcement. It is assumed here that physical inventories may be taken at any time within specified periods (perhaps six months or a year for LEU and two to three months for HEU and Pu).

The level of assurance that special nuclear material is in fact being safeguarded is strongly dependent upon the timeliness of the data and the level of detail of the data gathered. MAC will provide data permitting NRC to:

- evaluate plant performance;
- develop triggers and alarms to signal abnormal conditions;

- retrieve data needed for assessment and event response;
- aid in the investigation and possible recovery in cases where it has been determined that material is missing.

In addition MAC provides NRC with a means of determining and controlling the data which are reported to the IAEA.

To enable the NRC to evaluate plant performance, MAC calculates a book balance each day for each RIS, ICA, or MBA, and retains the most current inventory data. Using equipment standard errors, it calculates ID and physical inventory and the measurement error associated with the inventory and compares the book and physical inventory values to determine the level of inventory differences. It compares reported limits of error with the error measurement capabilities specified in the licensee's material accounting plan. MAC retains historical records of all reported transactions and inventories to allow for trend analysis and for shipper-receiver differences (SRD) comparisons to ensure the integrity of reporting.

Using NRC-determined trigger levels, MAC provides outputs on reporting errors (a limit on which will be license-specified to increase the quality of the data), increasing ID and measurement error trends, CUMUF and ID above historical levels for the plant, shipper-receiver difference biases or trends, and other abnormal occurrences such as unusually large shipments or negative book balances. These trigger-level limits may be determinable through experience gained using the MAC module reports. When a situation occurs requiring additional investigation, ISIS can respond with historical data on transactions, inventories, possession limit changes, and measurement data as well as names, addresses, and phone numbers of the appropriate on-plant as well as NRC personnel. The same data combined with inspection results can aid in the investigation and possible recovery of material which appears to be missing.

The MAC module performs a comparison between the existing inventories at each facility with that facility's authorized possession limit to detect conflicts.

The transaction and inventory data collected by MAC enables it to report the required monthly data to the IAEA in a form controlled and validated by NRC. The U.S. must comply with IAEA reporting requirements. The basic IAEA reporting requirements are set forth in INFCIRC 153 and modified by the specific U.S.-IAEA agreements still under negotiation. These requirements are that Inventory Change Reports (ICR) be reported within 30 days of the end of the month in which the change occurred and that Physical Inventory Listings (PIL) be reported within 30 days of the physical inventory. Both the ICRs and PILs are on the Material Balance Area (MBA)/Inventory Control Area (ICA) level in terms of location and

on the "batch" level in detail. All ICRs and PILs must be verifiable. In addition to the ICRs and PILs, Material Balance Reports (MBR) must be submitted to IAEA. MBRs provide overall balances for all types of nuclear material for the specific MBA in question.

Although the increased detail of the reported data required by the IAEA (and for effective safeguards by the NRC) increases the reporting burden of the licensee, the further burden of reporting to the IAEA and interacting with the IAEA will be performed by MAC. The data reported to the IAEA will also be reported to the licensee for his records. By doing this, the licensee knows what has been reported and he can point out any errors and inconsistencies in the data, thus providing still another quality assurance check on the data in ISIS.

The Material Accounting Module provides summary data to NRC Headquarters as well as the regions to provide the basic materials accounting safeguards supporting role. The variety of output records and the IAEA level of input reporting provides NRC with the ability to meet its regulatory needs without forcing a level of reporting detail that overburdens the licensee and leads to quality-assurance problems.

ISIS will, as a general capability, provide system audits for all transactions made against the ISIS data base. This general capability satisfies a MAC requirement to provide an audit trail for all SNM inventory changes. ISIS provides the many levels of data security required by the data in the MAC portion of ISIS.

2.2 CURRENT OR PROJECTED INFORMATION NEEDS

NRC's material accounting safeguards needs have and will basically remain the same. What has changed has been an increase in the number of plants involved and the level of detail and timeliness of the data reported. Projections of the regulatory environment assume that the level of detail of reporting will be at least sufficient to support the IAEA requirements at all plants, and that the timeliness of reporting will be on a daily or as-generated basis with limits on frequency rather than fixed dates. These reporting requirements require changes in the regulations and addenda to the licenses.

Transaction reporting to ISIS will be required on a daily basis. While this may seem to be an increased burden, it is projected that by the 1980's computation facilities will be available in all but the smallest plants for at least process control if not also for measurement and inventory control. It should pose no difficulty for a licensee to define a "close of working day" and report all transactions for that day directly (computer to computer perhaps) to MAC by midnight of that day (EST). These reporting requirements may be made site-dependent in order to take into account the type of facility and volume of daily

transaction data. These data can be used by NRC in evaluating the daily trends in SNM movement and data on current inventories in the case of actual threats. Up-to-date inventory data can also be generated for use by inspectors. The daily transaction data may be reflected to the licensee for corrections and to provide him with a record of the data MAC has about his plant. This will help to eliminate a variety of error sources and ensure more complete and careful reporting.

Data for the current Material Accounting System (NMMSS) is gathered on DOE/NRC Forms 741 and 742. The 741 transaction form will be used to report all the items in Table 2. The 742 Materials Status Report will be replaced by the MUF Transaction Report on the inventory transaction level of detail required by the IAEA for each plant (or by the NRC for plants not reporting to the IAEA). This requires changes in the regulations and in the licenses (to change the material accounting plan). Many of the data elements on the transaction report may remain the same to support the data requirements of NMMSS.

Some additional data elements will have to be added to identify the type of transaction, LEU owner, and transportation plans. The regulation and license changes involved will be more to effect timeliness and level of detail than to generate new sources of data.

3.0 RELATION OF MAC TO EXISTING NRC SYSTEMS

The safeguards material accounting function is presently performed by NMMSS and the Safeguards Status Report Systems. Functionally, MAC will absorb all of the material accounting functions of these two systems as well as elaborating on some of them. ISIS through MAC will provide easier online access to the data base for both headquarters and the regions than can be provided by NMMSS due to the intermingling of the defense-related DOE data. The improved timeliness and direct reporting of the data by the licensees will remove the need for data-gathering at the regional level.

MAC will interface with NMMSS because of the need to support transactions between licensees and DOE contractors and DOE accounts. The interface will also allow simultaneous updating of both data bases for such things as new RIS codes, address changes, etc. MAC will also be the U.S. interface between the licensees and the IAEA.

4.0 NRC OFFICES INVOLVED IN MAC

4.1 REPORT USERS

The users of MAC will be the users of existing NMMSS and Safeguards Status Report Systems. These include NRC Headquarters and Regional Offices of Inspection and Enforcement and the Headquarters Offices of Nuclear Material Safety and Safeguards, Standards Development and Nuclear Regulatory Reseach.

During the course of determining information requirements, the comment was made repeatedly by NRC managers in all of the above-mentioned offices that they needed more timely and accurate SNM accounting data than they were getting (see Section 4.2.4 in Phase I Report). While it will involve changes in regulations to increase licensee reporting frequency, the MAC module of ISIS is intended to satisfy this and related perceptions of NRC managers' needs for SNM accounting data.

4.2 INPUT RESPONSIBILITIES

Input data for MAC will be generated by the licensees in the form of Transaction Reports.

4.3 DATA QUALITY

Quality Assurance of the data will be the responsibility of part of the operating group for ISIS. Much of the QA will be handled by feedback of the input data for confirmation by the submitter. Response time on feedback should be a function of the level of automation at that facility and the volume of transactions from that facility.

4.4 ACCESS CONTROL

Access to output reports from MAC will be controlled by the office in charge of ISIS.

5.0 MODULE DATA BASE

Figure 5.1 shows the forty-one (41) constructs which are accessed to produce the MAC reports. The MAC constructs store information about nuclear materials shipments and inventories. The MAC constructs maintain the information which is currently reported on NRC forms 741 and 742.

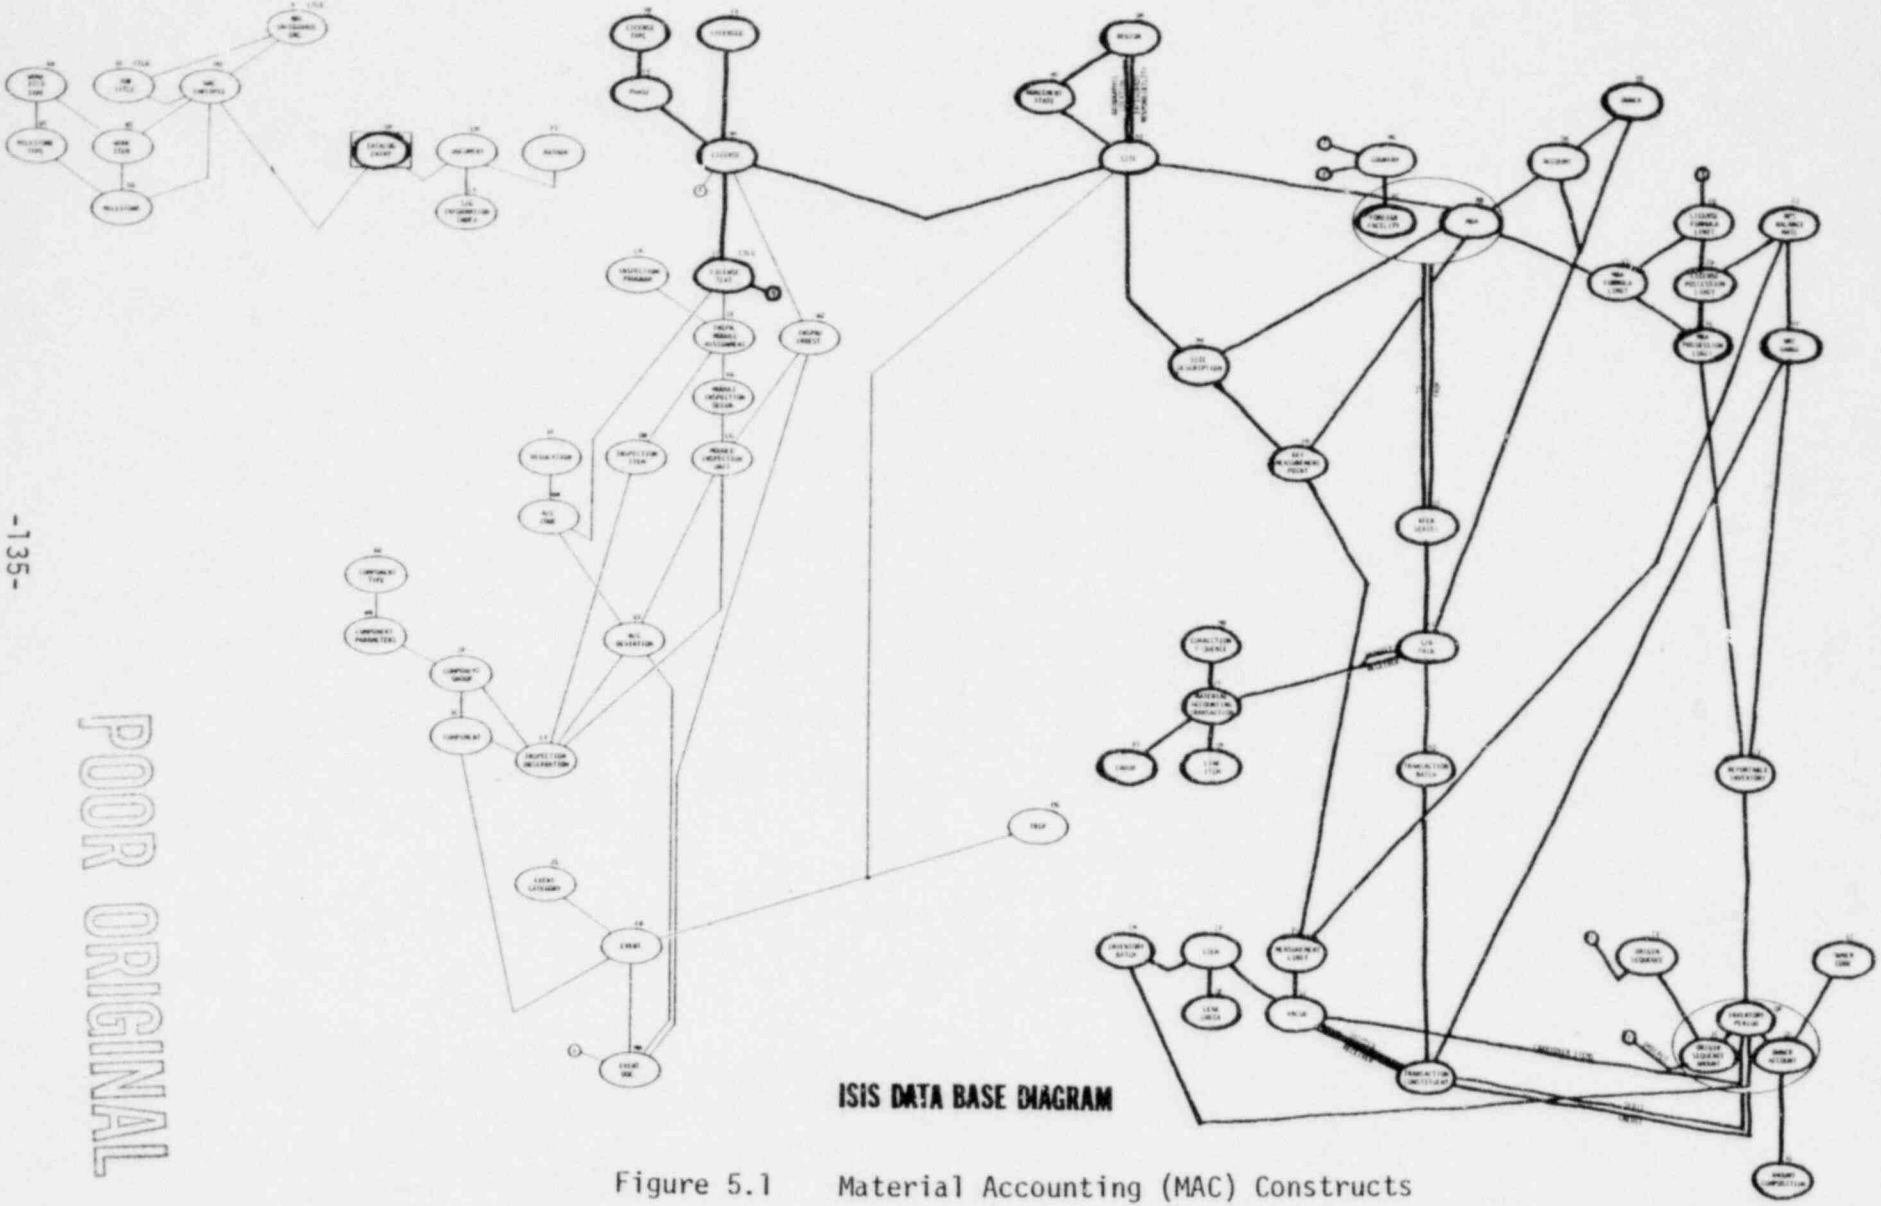

Figure 5.1 Material Accounting (MAC) Constructs

6.0 OUTPUT REPORTS AND INPUT FORMS

6.1 LIST OF OUTPUT REPORTS

Report Number	Report Title
R0399	List of RIS Numbers
R0742	List of NRC Licensees by Region
R0451	Book Balance by Region
R6549	Current Book Balance by License
R4250	Historical Physical Inventory by MBA
R8662	Dated Book Balance by License
P5681	Detailed Licensee Inventory by MBA
P7172	Inventory Differences by MBA
R2743	Inventory Difference Summary by Region
R0131	Historical Inventory Difference by MBA
R6655	Shipper and Receiver Transaction Values by Facility
R7963	Historical Facility Shipper-Receiver Differences (SRD)
R2906	Sealed Source Locations
R3107	Reporting Errors
R3479	MBA Possession Limit Violations
R5280	General Possession Limit Violations
R2565	Unresolved Transaction Errors
R8408	Random Sample of Transactions
R7009	Facility-Facility Transaction Summary
R8776	Facility-Internal MBA-MBA Transactions
R4846	Open Transactions
R7254	Late Transaction Report
R2891	Summary List of On-Site Gains and Losses
R1992	Five Year Shipment or Receipt Summary
R9204	IAEA Inventory Change Report
R1694	IAEA Physical Inventory Listing
R6864	IAEA Material Balance Report
R3378	Cumulative Inventory Difference Report
R6282	Transaction Analysis Report
R9975	Transaction Limit of Error Report
R4621	DOE Material by Licensee
R2390	Material Accounting Transactions by Owner
R1501	Material Origin Book Balance
R5877	Country Listing by Origin Sequence
R3699	Location and Amt of Matl of Specified Origin Seq.
R2615	Location of Matl of Specified Country in Origin Seq.

6.2 LIST OF INPUT FORMS

Form Number	Form Title
F1498	Material Accounting Transaction Form
F3264	Physical Inventory Reporting Form
F1115	Transaction Update Form
F5994	Value Update Form
F1112	SNM Owner Identification
F1113	Occurrence of a Leak Check
F8257	Licensee Update Form
F5360	License Update Form
F2000	License Text Update Form
F2126	License Type and Phase Update Form
F5535	License Possession Limit Update Form

PROCESSING NOTES

THE SELECTION CRITERIA IS SUCH THAT ALL MBA'S ARE SELECTED THAT MEET THE GIVEN INPUT PARAMETERS, TESTED IN CONDITIONS (1), (2), (3), (4). THEREFORE, AFTER CONDITION (4), THOSE MBA'S SELECTED SATISFY THE FIRST FOUR PARAMETERS(P8,P9,P1,P2) IF SPECIFIED.
IN THE DISPLAY SECTION, "IF P- " REFERS TO THE LOWEST LEVEL PARAMETER SPECIFIED. HIGH TO LOW: LICENSE TYPE, DOCKET NUMBER, RIS, MBA.

TITLE

DATED BOOK BALANCE BY LICENSE

PURPOSE

THIS REPORT WILL LIST THE BOOK BALANCE OF EACH NRC BALANCE MATERIAL UNDER A PARTICULAR LICENSE AS OF A SPECIFIED DATE. IF CURRENT BALANCE IS DESIRED, ISIS REPORT R6549 SHOULD BE USED.

TITLE

INVENTORY DIFFERENCES BY MBA

PURPOSE

THIS REPORT WILL LIST INVENTORY DIFFERENCES REPORTED DURING THE LAST COMPLETED INVENTORY PERIOD FOR EACH STANDARD MATERIAL TYPE WITHIN A PARTICULAR MATERIAL REPORTING AREA. THE REPORT CAN BE SELECTED FOR A SPECIFIED MBA OR FOR ALL MBA'S UNDER A PARTICULAR LICENSE TYPE.

FREQUENCY: MONTHLY OR ON DEMAND (500/YR)

TURN-AROUND: OVERNIGHT

LENGTH: APPROX. 25 PAGES

TITLE

SHIPPER AND RECEIVER TRANSACTION VALUES BY FACILITY

PURPOSE

FOR EACH FACILITY A LISTING OF SHIPPER-RECEIVER VALUES FOR ELEMENT AND ISOTOPE WEIGHTS WILL BE GENERATED. THIS REPORT WILL BE USED BY ONMSS AND DIE. A SECOND LISTING WILL OUTPUT ONLY THOSE SHIPPER-RECEIVER VALUES THAT DO NOT LIE WITHIN THE REPORTED LIMITS OF ERROR.

FREQUENCY: MONTHLY, ON THE FIRST OF EACH MONTH. (12/YR)

TURN-AROUND: OVERNIGHT

LENGTH: APPROX. 25 PAGES

TITLE

HISTORICAL FACILITY SHIPPER-RECEIVER DIFFERENCES (SRD)

PURPOSE

THIS REPORT WILL PROVIDE A HISTORICAL RECORD OF THE TRANSACTION SRD'S FOR A SPECIFIC FACILITY. IT WILL BE USED TO DETERMINE WHETHER A FACILITY IS CONSISTENTLY REPORTING HIGH OR LOW SRD'S RATHER THAN A NORMAL DISTRIBUTION. ONNSS AND OIE WILL USE THIS REPORT.

FREQUENCY: UPON REQUEST (12/YR)

TURN-AROUND: OVERNIGHT

LENGTH: APPROX. 500 PAGES

PARAMETERS

RIS INPUT AN MBA FACILITY AS SHIPPER OR RECEIVER	(P1) (P2)

TITLE

SEALED SOURCE LOCATIONS

PURPOSE

THE LOCATIONS OF NRC LICENSED SEALED SOURCES WILL BE CONTAINED IN THIS REPORT WHICH WILL BE OF USE TO THE INSPECTORS AS WELL AS VARIOUS PERSONNEL IN ONMSS AND OIE. A SECOND REPORT OPTION WOULD IDENTIFY ALL SEALED SOURCE ITEMS BY OWNER.

FREQUENCY: UPON REQUEST (4/YR)

TURN-AROUND: OVERNIGHT

LENGTH: APPROX. 300 PAGES

PARAMETERS

REPORT OPTION (P1)

VALUES = "OWNER" OR "LOCATION"

RIS INPUT (P2)

IF OPTION = "OWNER", THIS IS AN OWNER RIS

CALCULATIONS

OVERDUE FOR LEAK CHECK? (C1)
YES OR NO AS A FUNCTION OF

PROCESSING CONSIDERATIONS

TO ARRIVE AT THE LIST OF SEALED SOURCE ITEMS ACTUALLY AT A SITE FIRST RETRIEVE ALL CARRY-OVER SEALED SOURCE ITEMS, ADD ALL SEALED SOURCE ITEMS RECEIVED DURING THIS INVENTORY PERIOD, AND SUBTRACT THOSE SHIPPED.

TITLE

REPORTING ERRORS

PURPOSE

RECORDS OF ERRORS AND THEIR SOURCE WILL BE KEPT. THIS REPORT WILL PROVIDE A SUMMARY LISTING OF ISIS-DETECTED REPORTING ERRORS BY RIS AND BY ERROR CODE AND CALCULATE AVERAGE TIME FOR CORRECTION. IT IS EXPECTED THAT THIS REPORT WILL BE USED BY DIE, ONMSS, ONRR(REACTORS), AND ONRR(RESEARCH).

FREQUENCY: FIRST OF EACH MONTH. (12/YR)

TURN-AROUND: OVERNIGHT

LENGHT: APPROX. 25 PAGES

TITLE

UNRESOLVED TRANSACTION ERRORS

PURPOSE

THIS REPORT LISTS FOR EACH RIS THE UNRESOLVED TRANSACTION ERRORS.
A DATE PARAMETER ALLOWS FOR TWO TYPES OF UNRESOLVED ERROR REPORTS:
1) YESTERDAY'S DATE, GENERATES LISTING OF PREVIOUS DAY'S ERRORS;
2) ANY OTHER PREVIOUS DATE, GENERATES CUMULATIVE ERROR REPORT
SINCE THAT DATE.

FREQUENCY: DAILY FOR A PREVIOUS DAY REPORT, ELSE UPON REQUEST.(500/YR)

TURN-AROUND: OVERNIGHT

LENGTH: APPROX. 2 PAGES

TITLE

LATE TRANSACTION REPORT

PURPOSE

THIS REPORT WILL PROVIDE A LIST OF THE LATE TRANSACTIONS FOR EACH FACILITY WHICH CAN BE USED TO CHECK COMPLIANCE WITH REPORTING REQUIREMENTS. LATE TRANSACTION IS DEFINED TO BE ONE WHERE THE RECEIVER FAILS TO VALIDATE THE MEASUREMENTS OF HIS RECEIPT WITHIN A SPECIFIED PERIOD OF TIME(THE CASE WHERE HE OR THE SHIPPER IS LATE IN SENDING IN THE TRANSACTION ITSELF (ACTION CODES A OR C) IS AN OPEN TRANSACTION AND APPEARS ON THAT REPORT).

FREQUENCY MONTHLY, OR UPON REQUEST. (12/YR)

TURN-AROUND: OVERNIGHT

LENGTH: APPROX. 10 PAGES

PARAMETERS

MAXIMUM NUMBER OF DAYS STORED IN ISIS	(P1)
ACCOUNT RIS	(P2)
BEGIN DATE	(P3)
END DATE	(P4)

CALCULATED RESULTS

TITLE

SUMMARY LIST OF ON-SITE GAINS AND LOSSES

PURPOSE

ON-SITE GAIN AND LOSS TRANSACTIONS WILL BE INCLUDED IN THIS REPORT FOR EACH FACILITY. A TRANSACTION IS IDENTIFIED AS REPORTING AN ON-SITE GAIN OR LOSS IF THE TRANSACTION TYPE IS OTHER THAN MATERIAL TRANSFER, IE, IF IT IS MEASURED DISCARD, LOSS, MUFF, BURN-UP, ETC. THIS REPORT WILL BE OF USE TO DIE AND ONMSS PERSONNEL.

FREQUENCY: MONTHLY(FIRST OF MONTH) OR UPON REQUEST. (400/YR)

TITLE

1AEA INVENTORY CHANGE REPORT

PURPOSE

THE 1AEA INVENTORY CHANGE REPORT (ICR) WILL BE GENERATED FROM THE FACILITY DATA AND SENT TO THE 1AEA. A COPY WILL THEN GO BACK TO THE FACILITY FOR VERIFICATION. COPIES WILL ALSO GO TO ONMSS PERSONNEL. THE REPORT WILL SHOW ALL CHANGES IN THE SNM INVENTORY FOR EVERY MATERIAL BALANCE AREA ELIGIBLE FOR 1AEA SAFEGUARDS.

FREQUENCY: MONTHLY

PARAMETERS

MBA INPUT (P1)

BEGINNING DATE-THIS REPORT (P2)

ENDING DATE-THIS REPORT (P3)

BEGINNING DATE-PREVIOUS REPORT (P4)

STATUS OF ENTRY (C1)
VALUES= "CORRECTION" - IF TRANSACTION IS CORRECTING DATA PREVIOUSLY REPORTED TO THE 1AEA OR IF TRANSACTION DATE FELL WITHIN RANGE OF PREVIOUS 1AEA REPORT BUT WAS CAPTURED TOO LATE TO BE REPORTED
"NEW"

TITLE

1AEA PHYSICAL INVENTORY LISTING

PURPOSE

THE PHYSICAL INVENTORY LISTING (PIL) WILL BE GENERATED FROM THE FACILITY DATA FOR REPORTING TO THE 1AEA. ALL BATCHES WILL BE LISTED AND IDENTIFIED. A COPY OF THE REPORTED DATA WILL BE SENT TO THE FACILITY AND APPROPRIATE DNMSS PERSONNEL. THIS CAN ONLY BE GENERATED AFTER ASSURANCE IS OBTAINED THAT PHYSICAL INVENTORY DATA IN ISIS IS CORRECT.

FREQUENCY: AT EACH PHYSICAL INVENTORY

TITLE

CUMULATIVE INVENTORY DIFFERENCE REPORT

PURPOSE

THIS REPORT WILL LIST INVENTORY DIFFERENCES REPORTED DURING ALL INVENTORY PERIODS COMPLETED WITHIN A SPECIFIED TIME-FRAME FOR EACH STANDARD MATERIAL TYPE WITHIN A PARTICULAR MATERIAL REPORTING AREA. A RUNNING TOTAL WILL BE REPORTED FOR EACH INVENTORY PERIOD TO INDICATE THE CUMULATIVE INVENTORY DIFFERENCE FOR A SPECIFIED NUMBER OF INVENTORY PERIODS. THE REPORT CAN BE SELECTED FOR A SPECIFIED MBA OR FOR ALL MBA'S UNDER A SPECIFIED SITE.

FREQUENCY: SEMI-ANNUAL OR ON DEMAND (4/YR)

TURN-AROUND: OVERNIGHT

LENGTH: APPROX. 40 PAGES

TITLE

TRANSACTION ANALYSIS REPORT

PURPOSE

FOR EVERY SHIPMENT WHOSE DATE OF SHIPMENT FALLS WITHIN A USER-SPECIFIED TIME FRAME, THE SHIPMENT AMOUNTS ARE COMPARED WITH THE SHIPPER'S MBA POSSESSION LIMITS FOR THAT MATERIAL. IF THE AMOUNTS SHIPPED EXCEED A USER-SPECIFIED PERCENTAGE OF THE ASSOCIATED POSSESSION LIMIT, THE TRANSACTION IS CLASSIFIED AN "IRREGULAR" TRANSACTION, AND PERTINENT DATA ABOUT IT APPEAR ON THIS REPORT.

FREQUENCY: AS REQUIRED (25/YR)

TURN-AROUND: OVERNIGHT

DOCUMENT CONTROL SYSTEM SAFEGUARDS INDEX (DCSINX)

1.0 ABSTRACT

The purpose of this service module is to provide a high level index in support of the automated microfiche storage and retrieval system recently operated by the Office of Administration, Technical Information Division. The Document Control System (DCS) contains in microfiche form the complete text for all NRC documents and provides subject, title and author indexes to these documents. The ISIS DCSINX service module supplements these indexes by identifying specific document sections and/or pages related to the safeguards function. Benefits arising from DCSINX include a decrease in the time required to identify and retrieve safeguards-related material within documents and a corresponding decrease to DCS computer load by reducing the amount of browsing performed in conjunction with safeguards activities. The DCSINX will be maintained apart from the DCS but will be coordinated with it through the use of the source accession number to identify a document.

2.0 PURPOSE OF DCSINX

2.1 FUNCTIONS AND CAPABILITIES

The purpose of the DCSINX module is to provide increased access to safeguards-related NRC documents. It will be used in conjunction with the Document Control System (DCS) to identify specific sections, subsections or document pages relevant to safeguards activities. By using DCSINX, NRC staff will reduce the browsing time and effort required to identify and access safeguards-specific data within the DCS.

2.2 CURRENT OR PROJECTED INFORMATION NEEDS

The Document Control System Index Module supplements the Technical Information Division of the Office of Administration by identifying the location of pertinent safeguards-related data within documents. The DCS will reference documents only in a general way and will not identify the location in non-safeguards oriented documents of specific subsections related to the safeguards function. Thus the NRC staff member needing specific information will need to browse through the document to identify specific sections or subsections containing safeguards data. DCSINX will assist the staff member by identifying where within the document safeguards-related information is to be found, thereby reducing his need to browse through the document.

The document needs involved in developing and enforcing a good safeguards system include the ability to locate safeguards relevant information in otherwise unrelated documents, and the availability of abstracts of pertinent documents such as licenses, reports, and facility description data. These needs will be met via the DCSINX.

One problem which has not been resolved for DCS is the handling of classified documents. It was initially projected that the first DCS would handle only non-classified documents.

It is felt that ISIS is a data-oriented system in comparison to DCS which is viewed as a document-oriented system. One interface between the two systems will be the DCSINX Module. Other modules will interface with the DCS, through the accession number, in support of specific functions such as the inspection report text, safeguards status report book (white book), nuclear facility description data, etc.

3.0 RELATION OF DCSINX TO EXISTING NRC SYSTEMS

No NRC data processing system currently exists which provides the functions envisioned by the DCSINX Module. However, DOE's Technical Information Center does currently support NRC with document-oriented products closely identified with the Document Control System Activities. These include:

- Bibliographic Information Base - Catalog, Abstract, Index of selected NRC docket-related documents and reports;
- Power Reactor Docket Information (PRDI);
- Index for Nuclear Regulatory Commission Issuances;
- Fiche Index of Nuclear Dockets (FIND) and Public Document Microfiche Service;
- NRC Bibliographic Data Service to Energy Research Abstracts and NTIS;
- Technical Information Searches for NRC (Manual and Recon).

Of these items, 2 through 4 will be assumed by the Document Control Division (and assumedly the DCS) in FY 79. The DCS produces a Daily and Monthly Accession List of all new documents, and is capable of retrospective searching. The DCS will not subdivide documents to the level envisioned as required by safeguards personnel. The subdivision of documents is the role of the DCSINX Module for safeguards-related data.

The NRC staff member would identify the documents to be examined by their DCS assigned Accession Number. This unique document identifer can be obtained from several sources, one being the DCS via a query by subject, title or author, another from the Daily Accession List, etc. Once obtained, the accession number is used to query ISIS to determine if it contains safeguards-related data and if so, where within the document. DCSINX outputs the page numbers and microfiche references for the safeguards information within the document(s).

Note: The maintenance of the DCSINX is <u>not the responsibility</u> of the DCS.

4.0 NRC OFFICES INVOLVED IN DCSINX

4.1 REPORT USERS

It is assumed that the DCSINX Module will be used by all NRC staff interested in safeguards. Since the DCSINX is used only to identify the existence of safeguards information along with an abstract of the actual document, consideration need only be given to limiting access to individuals having the appropriate security clearances if the abstract itself requires security consideration. It will be the responsibility of the DCS to control access to the documents.

4.2 INPUT RESPONSIBILITIES

The DCSINX is assumed to operate in three modes: query, new documents, and update. The functions of each are:

1. Query - implies that DCSINX is only to respond to queries. Queries have restricted input, specifically the accession number, the document publication ID, or the document title for a document of interest. Output in this mode is the list of microfiche reference numbers for safeguards information and text describing the information. This descriptive text could be in concise narrative form, or could consist of a key word, depending on the amount of rigor NRC decided to impose;

2. New Document - this mode is used to add new document entries to the DCSINX and is performed once daily. It derives the input data from the Daily Accession List. At this point the new entries have limited to no data as to safeguards contents. It is the function of NRC staff members using documents to update the DCSINX records, and thus to make their analysis available to other NRC staff;

3. Update - the Update mode is used to record references to safeguards information within a document. Inputs include document page and text describing the specific subject. No entries are deleted and the entries are automatically sequenced by page.

4.3 DATA QUALITY

The quality assurance function is not identifiable with current NRC personnel. However, a person performing liaison between DCS and ISIS would assure that new entries are added and to assure that references are accurate.

4.4 ACCESS CONTROL

Not applicable.

5.0 MODULE DATA BASE

Figure 5.1 shows the three (3) constructs which are accessed to produce the DCSINX reports. The DCSINX constructs store information principally obtained from the Document Control System DCS. The DCSINX constructs allow safeguards information within documents to be indexed and referenced.

SAFEGUARDS ITEM TRACKING SYSTEM (SITS)

1.0 ABSTRACT

SITS will provide to NRC managers and staff who become responsible for safeguards work items or action items a capability for tracking the status of the work/action items and a means to notify responsible persons that milestones associated with work/action items are imminent, due or overdue.

2.0 PURPOSE OF SITS

2.1 FUNCTIONS AND CAPABILITIES

SITS will serve the functions of safeguards-related work/action item tracking, notification of principals for overdue work items or action items. SITS will serve all NRC safeguards-involved offices, divisions, branches and personnel and will be invoked for all transactions between any two NRC safeguards "groups" which result in one party to the transaction requesting some specific task or action of the second party. Work items to be tracked by SITS include intergroup (and if desired intragroup) task assignments, milestone establishment, action item assignments for further communications, investigations, or research, etc. SITS will not necessarily be a major management system for control of task assignments within normal organizational hierarchical groups, but such capability will exist for use by those managers who desire it. SITS will be primarily directed to intergroup assignments and requests. The status of such work items need be monitored periodically until closure at which time they should be appropriately cataloged and made available in a historical file.

The capabilities of SITS are primarily to provide visibility to NRC managers of the volume, nature, duration and manpower requirements of the work items for which personnel in their groups are responsible. SITS will also serve a very important function as a work item "tickler" system, whereby notification will be sent to responsible work item personnel for pending milestones, notifications of the arrival of milestone dates will be made, and subsequent to the passing of a milestone date an increased frequency of notifications or inquiries will be implemented.

The form of SITS data available to NRC managers will be reports on the work items assigned to the various levels of the NRC organization. For example, the number of work items with pertinent data on responsible individuals, milestones, estimated and expended manpower requirements, etc., for a given office could be reported. Further breakdowns of the outstanding work items could be made, such as by division department, branch, section or individual.

In addition to grouping outstanding work items by responsible office or person, listing will be available grouped by type of action items or work item, by time period when due, by time period when assigned, by originating office (requestor), etc. SITS is to serve primarily as a management information system to allow evaluation, assessment and perusal capabilities to NRC managers with respect to safeguards work items in their group which originated outside the group.

2.2 CURRENT OR PROJECTED INFORMATION NEEDS

The scope of SITS is to encompass all of NRC although it is specifically directed to the offices and groups within offices that have safeguards activities and responsibilities. The current need for a work item tracking system is evident in NRC in that OIE has developed an Action Item Tracking System (AITS) as part of their management information system. The OMIPC Division of Regulatory Information Systems has designed and developed a Technical Assignment Control System (TACS) to provide ONRR (regulation) managers with an automated method for planning, scheduling, and controlling the status of the total work effort of ONRR. TACS is also being evaluated by ONMSS to determine applicability and desirability of that offices' using the system.

As safeguards activities become a larger component of NRC's overall group of activities, there are bound to be more and more groups within NRC which have safeguards related responsibilities. Accordingly, the intergroup work item transactions will increase not only in volume but also in complexity. The projected requirements of the SITS service module are thus primarily for increased reporting capacity rather than any significant new capabilities.

3.0 RELATION OF SITS TO EXISTING NRC SYSTEMS

The SITS module will perform functions that are similar to and somewhat overlap the functions performed by two existing NRC data processing systems:

- The Action Item Tracking System (AITS) which is part of the management information system of OIE;
- The Technical Assignment Control System (TACS) developed by OMIPC Regulatory Information Division for ONRR and potentially ONMSS.

SITS will monitor and track those safeguards related action items that are currently tracked by the AITS but will expand the coverage from just OIE to all NRC offices. Those planning, coordinating and scheduling activities that are safeguards related in ONRR (and possible ONMSS) that are currently TACS controlled will be included in SITS.

In both instances above, the determination of existing system overlap and the subsequent interface design will be a significant implementation task for the SITS service module of ISIS.

4.0 NRC OFFICES INVOLVED IN SITS

4.1 REPORT USERS

SITS will be designed so that all NRC safeguards related groups have access to the module's reports. Potential report recipients and users are any personnel who have the responsibility to fulfill a safeguards work item or action and the managers whose personnel have work/action item responsibility.

4.2 INPUT RESPONSIBILITIES

All NRC personnel who author safeguards work items will generate the input data for SITS.

4.3 DATA QUALITY

None.

4.4 ACCESS CONTROL

None.

5.0 MODULE DATA BASE

Figure 5.1 shows the seven (7) constructs which are accessed to produce the SITS reports. The SITS constructs store information about safeguards items to be tracked by the SITS module. Milestone information is maintained for the items to be tracked and individuals responsible for specific milestones are noted. As part of the information maintained by SITS, the NRC safeguards organizational structure is stored in SITS constructs and the corresponding position/job titles are referenced.

WORK/ACTION (W/A) ITEM SUMMARY BY NRC OFFICE

PURPOSE

THE PURPOSE OF THIS REPORT IS TO PROVIDE A MANAGEMENT SUMMARY TO AN NRC OFFICE OF W/A ITEMS ACTIVE WITHIN THAT OFFICE BY MILESTONE WITH STATISTICAL MEASURES APPLIED TO COMPLETED MILESTONES

FREQUENCY: ON REQUEST (240/YR)

TURN-AROUND: OVERNIGHT

LENGTH: APPROX. 10 PAGES

RIS STATUS CODE (TM1864.
-ACTIVE
-INACTIVE

RIS ADDRESS (IF ANY) (TM1566.

MATERIAL BAL AREA (RB)
MATL BAL AREAS (RBS)

A COLLECTION OF AREAS WITHIN A 'SITE' WHICH ARE REGARDED AS EQUIVALENT WITH RESPECT TO THE LOCATION OF REGULATED MATERIAL. (FOR EXAMPLE, AN MBA IS A MATERIAL BALANCE AREA, BUT THE CONCEPT IS BROADER THAN THE CURRENT MBA CONCEPT. FLEXIBILITY EXISTS HERE SO THAT NRC MAY REQUIRE REPORTING OF MATERIAL MOVEMENT TO ANY DETAIL. AT ONE EXTREME, NRC MAY DEFINE A SAFEGUARDS REPORTING AREA FOR A WHOLE SITE (THIS IS DONE NOW IN NMMSS AND IS CALLED A RIS). AT THE OTHER EXTREME, NRC MAY DEFINE A S/G REPORTING AREA FOR EACH LOWEST LEVEL PHYSICAL SECURITY AREA AT A SITE, REQUIRING A REPORT WHENEVER MATERIAL MOVES FROM ONE TO ANOTHER. IT IS PROJECTED THAT ON BALANCE THESE EXTREMES GIVES NRC ADEQUATE VISIBILITY WITHOUT OVERBURDENING THE LICENSEES.)

OPT. SIZE = 200 MAX. SIZE = 300
OPT. OCCUR. = 4000 MAX. OCCUR. = 8000

*RELATIONSHIPS TO SUPERIOR CONSTRUCTS:

IS INCLUDED IN AN ACCOUNT ID (RBTM)

APPLIES TO LICENSE POSSESSION LIMIT (XCZD)

*RELATIONSHIPS TO SUBORDINATE CONSTRUCTS:

DEFINES REPORTABLE INVENTORIES (XCZV)

*DATA ELEMENTS

MAXIMUM ELEMENT WEIGHT (XC2776)

MAXIMUM ISOTOPE WEIGHT (XC1083)

MAXIMUM ENRICHMENT (XC4163)

INVENTORY PERIOD
INVENTORY PERIODS (QP
(QPS

AN INVENTORY PERIOD IS THE PERIOD OF TIME BETWEEN TWO INVENTORY CLOSE-OUTS. A CLOSE-OUT IS ACCOMPLISHED BY TAKING A PHYSICAL INVENTORY. THUS, THE HISTORICAL, DATED RECORDS INDICATE THE RESULTS OF THAT PHYSICAL INVENTORY, AND CONSEQUENTLY THE CLOSE-OUT BALANCE FOR THAT INVENTORY PERIOD. THE CURRENT BALANCE AT ANY GIVEN TIME IS KEPT WITH NO CLOSE-OUT DATE INDICATED, THE UNDERSTOOD DATE BEING TODAY'S DATE. THIS CURRENT BALANCE IS ARRIVED AT BY CREDITING AND DEBITING THE PREVIOUS PERIOD CLOSE-OUT BALANCE.

- VAULT-ROAD,AIR,SHIP,RAIL,OR STORAGE

CONTAINER FUNCTION (ZN1364)
POSSIBLE VALUES:
- TRANSFER OF MATL IN PROCESS
- TRANSPORT OF LEU
- TRANSPORT OF HEU/PU
- TRANSPORT OF SM
- TRANSPORT OF SPENT FUEL
- STORAGE ON SITE
- WASTE STORAGE

MONITOR/ALARM TYPE (VK)
MONITOR/ALARM TYPES (VKS)

*RELATIONSHIPS TO SUPERIOR CONSTRUCTS:

NONE

*RELATIONSHIPS TO SUBORDINATE CONSTRUCTS:

NONE

*DATA ELEMENTS

TYPES OF MONITERS/INTRUSION ALARMS (VK8679)
POSSIBLE VALUES:
- ELECTRIC FIELD MONITORING
- MAGNETIC COIL MONITORING
- GAMMA COUNTERS MONITORING
- X-RAY MONITORING
- PERSONAL SEARCH MONITORING
- NEUTRON INTERREGATION MONITORING
- ACCOUSTIC ALARM
- TRIP WIRE ALARM
- SEISMIC ALARM
- MICRO WAVE ALARM
- CCTV ALARM
- MECHANICAL DEFORMATION ALARM
- PRESSURE MATS ALARM
- IR ALARM
- K-9 ALARM

MONITOR/ALARM FUNCTIONS (VK1573)
POSSIBLE VALUES:
- RADIATION MONITORING
- METAL DETECTION MONITORING
- EXPLOSIVES DETECTION MONITORING
- SNM DETECTION MONITORING
- FIRE ALARM
- ADVERSARY DETECTION ALARMS
- SURVEILLANCE ALARMS
- VIBRATION DETECTION ALARMS
- PROXIMITY DETECTION ALARMS

ASSAY TECHNIQUE TYPE (QS)
ASSAY TECHNIQUE TYPES (QSS)

*RELATIONSHIPS TO SUPERIOR CONSTRUCTS:
