TELECON WITH CANADY, DUKE POWER COMPANY, 9/28/72, GENERAL ITEMS

In a telecon with Duke (Canady) the following information was revealed.

1. The Duke consultant preparing the industrial security plan is not going to complete his work before October 15, 1972, the date which Duke had planned on submitting the plan to AEC. Duke will need two weeks to review after receiving the consultant's work. Hope is dimming for our chances of having the plan in time to review it before a November ACRS meeting. However, our position remains that the plan must be in the record prior to licensing Unit 1 although approval and implementation will not be a requirement for licensing Unit 1.
2. Duke is still considering my request for additional financial information per the telecon request from Ray Carroll, OC. Duke has read the regulation and feels that it has complied. I suggested that he (Canady) call Carroll in order to get specifics about the request before Duke makes up its mind what to do. He said he would do this.
3. Duke has only assumed that Oconee 2 would be used for the 450° control rod drive surveillance program. To Canady's knowledge there is no agreement in writing between B&W and Duke. (Our recent letter to B&W on this subject asks B&W to confirm this).
4. Duke's interpretation of Technical Specification 6.1.1.7c is that one licensed Reactor Operator will be actually (physically) in the reactor building when fuel handling operations are in progress and that the Senior Reactor Operator who is in charge of all fuel handling activities will be in the control room or other appropriate places surveying overall plant conditions pertinent to safe fuel handling (boron concentrations, cooling systems, radiation levels and external plant environmental conditions, etc.).
