(Board Question 3)-----page 16,907

P R O C E E D I N G S

(9:02 a.m.)

CHAIRMAN SMITH: Is there any preliminary business?

MR. TOURTELLOTT: Mr. Chairman, a couple of matters. One, the environmental impact appraisal of the staff was mailed out on Monday, the 30th, and should be in everybody's hands shortly.

The second matter concerns the schedule of submitting proposed findings, and as the Board will recall, we had pretty much agreed among the parties we would submit proposed findings on the design issues on the first of May. At that time it was assumed that we would be through the design issues by April the 1st, and of course that has not been what has occurred.

The parties on the design issue have agreed that those findings would be submitted instead of May 1 on June 1, and their reply findings would be due a month later, July 1.

Regarding other outstanding matters, the Staff provided a copy of its version of the history or background findings, and the Licensee intends to have its additions and supplementation to that and hopefully have the whole thing finalized so that we can submit that to the Board by May 1.

On management we hope to be able to provide the findings by May 15, again with reply findings due one month

1 later, June 15. And in the emergency planning area we have
2 not been able to arrive at a conclusion about when those
3 findings might be submitted, primarily because of the
4 present uncertainty of the schedule.

5 In management I might also add that we have not
6 been able to get in touch with Louise Bradford to ask her if
7 that is satisfactory with her, but assuming that it is, why,
8 that would be the date.

9 (Board conferring.)

10 CHAIRMAN SMITH: Mr. Trowbridge.

11 MR. TROWBRIDGE: I would confirm Licensee's
12 agreement with the three dates that Mr. Tourtellotte
13 mentioned, namely May 1 for the procedural findings, May 15
14 for management, and June 1 for design findings. We slipped
15 the last with great reluctance. Ms. Weiss had indicated to
16 us that they would have difficulty meeting the May 1 date,
17 the Staff had indicated the same, and we concluded we simply
18 cannot file findings of the quality expected by the Board
19 largely because the testimony in this area has gone on
20 longer and prevented in particular Tom Baxter and his
21 assistants from working on the findings as we had expected.

22 CHAIRMAN SMITH: Ms. Weiss.

23 MS. WEISS: I would just confirm that I believe it
24 is necessary to have this additional time in order to do the
25 findings in any degree of detail or quality.

1 CHAIRMAN SMITH: All right. We will discuss at a
2 separate session the problem presented by the continuing
3 open nature of the emergency planning problems. I think we
4 might have to consider going up to the Commission on
5 emergency planning and telling them --

6 MR. TOURTELLOTTE: I would also want to add that
7 this picking of the date for the design issue findings also
8 makes some assumptions about the ability to close out those
9 design items in the SER to the satisfaction of the Board.
10 And I do not want the Board to take this representation as
11 the date that we are seeking to close out and to submit
12 findings as some kind of an indication on the Staff's part
13 at this time that we in fact are going to be able to do that.

14 I am still working with the technical staff and
15 have a meeting proposed tomorrow between myself and Mr.
16 Denton and some other members of the technical staff to work
17 out these problems. I will advise the Board as soon as I
18 can as to the outcome.

19 CHAIRMAN SMITH: Is there anything that we could be
20 doing to assist? You suggested that early determination of
21 the Board, what we required to be satisfied would be
22 important; but is there anything else?

23 MR. TOURTELLOTTE: Actually, what I was referring
24 to there is the first thing that has to be done is the Staff
25 has to address the items in the SER, and then it will be

1 presented to the Board, and I have no way of knowing whether
2 -- what the Staff is going to do, whether we will meet your
3 requirements or not. I would hope that they would, but
4 there is a possibility that they would not.

5 CHAIRMAN SMITH: I do not have anything particular
6 in mind, but you will recall, for example, we sensed that
7 certain management issues were fading away, and we brought
8 that up and addressed it, and indeed they did to a large
9 extent -- they had faded away, and we addressed it in a
10 rather abbreviated way and adequately, too, I think.

11 If there is anything else of that nature that we
12 can be helpful on, why, we should be alerted to it and bring
13 it to our attention.

14 Anything further?

15 MS. WEISS: I had a couple of matters, Mr. Chairman.

16 First, the transcripts are getting to the public
17 document often as late -- document room in Washington as
18 late as three weeks after the date of the hearing, and I
19 just would appeal to the Board to see if there is any way to
20 speed that up.

21 CHAIRMAN SMITH: Yes, there is, and I am glad you
22 raised it. The last time I checked it was within about
23 seven days which was pretty good time, and I will inquire
24 into it. We do have the responsibility for the transcripts
25 -- that has been transferred from the Office of the

1 Secretary to the Board panel, and so we do have some control
2 over it; and I will inquire today.

3 MS. WEISS: Thank you.

4 (Board conferring.)

5 CHAIRMAN SMITH: We keep a library of the
6 transcripts in the hearing room.

7 MS. WEISS: Thank you.

8 The second thing I wanted to bring up are the tech
9 specs. I am not quite sure exactly how to do this, so I
10 thought I would bring it up before we leave. There have
11 been many references throughout the hearing to requirements
12 that will be incorporated into the tech specs for the plant
13 prior to restart, changes that will be made in the tech
14 specs.

15 And as we are beginning to get the findings
16 together, it has occurred to us that we really ought to have
17 those some place on the public record before the hearing is
18 over. And I do not know what the schedule is for producing
19 those, or if there is any mechanism for making those public.

20 CHAIRMAN SMITH: Mr. Trowbridge.

21 MR. TROWBRIDGE: We had not anticipated, Mr.
22 Chairman, that the tech specs any more than some of the
23 final procedures would necessarily be completed during the
24 course of this hearing. They would be in the category for
25 the most part of implementation by the staff of requirements

1 approved or established by this Board.

2 DR. JORDAN: Aren't tech specs part of the restart
3 report?

4 MR. PAXTER: Our proposed tech specs are in Chapter
5 11.

6 MR. CUTCHIN: Certain technical specifications, Mr.
7 Chairman, are also the subject of Board order items,
8 particularly items related to I&E Bulletin 79-05. There was
9 a direction there that certain tech specs would be submitted
10 to the Staff. At the time of the writing of NUREG-0680 the
11 Staff had not received both tech specs and the safety
12 evaluation supporting those tech specs which is required of
13 Licensee.

14 That matter will be updated in the supplement to
15 NUREG-0680, but I have no reason to believe now that that
16 item will be finally written off on as the Licensee
17 indicates. That is something that is normally finalized
18 much closer to the time that the plant would be estimated to
19 be ready for restart.

20 (Board conferring.)

21 DR. JORDAN: Before Mr. Pollard continues his cross
22 examination I just want to suggest one procedural item.
23 Finish with your questions on Wermiel's testimony but before
24 Mr. Curry starts I would like to suggest that he take us
25 through one of these -- at least one of the fault tree

1 diagrams showing how he puts the numbers in and so on. At
2 least I do not understand it thoroughly, and I think it
3 might save time. So -- but go ahead with your --

4 (Board conferring.)

5 DR. JORDAN: I'm sorry. It looks like I was ahead
6 of time, but I won't need to make this speech later.

7 (Laughter.)

8 MR. POLLARD: I think that would be very helpful.
9 I just wanted to continue on this discussion of the
10 technical specifications.

11 In UCS' view part of the proposed findings which we
12 would intend to submit would depend upon an assessment of
13 the actual technical specifications. From my own experience
14 I know that when technical specifications -- an attempt is
15 made to write them, it frequently has been found in the past
16 that the plant design or the availability of instrumentation
17 precludes the adoption of some particular technical
18 specification.

19 Also, in the testimony we have been going through
20 in the last few days the reliability of particular systems
21 can be affected by the allowable outage time for any
22 particular train or system, and I am somewhat at a loss to
23 understand how I can prepare proposed findings without
24 seeing what the actual technical specifications are going to
25 be.

1 Now, I did not fully follow the discussion that we
2 have just had. It seems to me that the Staff counsel was
3 saying that typically these are not available and that
4 somehow just because that is the normal way of doing things
5 we should not expect to receive technical specifications
6 before we have to do our proposed findings.

7 And I just want to express the view I do not agree
8 with that. I think they are a vital part for much of the
9 testimony that has gone on through this hearing.

10 MR. TROWBRIDGE: Mr. Chairman, as I think Mr.
11 Pollard well knows, there have been many, many operating
12 license hearings before the NRC and the AEC before it.
13 Technical specifications have always been a matter in some
14 cases of discussion, but always the final preparation has
15 been one of the items that came along after the hearing and
16 as part of the signoff process by Staff.

17 In this case, the case of this proceeding, it seems
18 to me you have very explicit directions from the Commission
19 that you take the requirements so far as far as you feel you
20 need to take them and specify them, but the detailed
21 information is left to the director unless the Board
22 concludes otherwise.

23 CHAIRMAN SMITH: I am trying to recall, Mr.
24 Pollard, if I have ever seen an initial decision by a
25 Licensing Board which goes beyond rather general license

1 conditions, even down to the point of tech specs, and I
2 cannot. Maybe you can help me on it, but I just --

3 (Board conferring.)

4 CHAIRMAN SMITH: Mr. Brenner and Dr. Little pointed
5 out that they have seen initial decisions by Licensing
6 Boards refer to tech specs and make requirements for tech
7 specs, making the general statement that tech specs shall
8 include certain conditions, but never to the point where we
9 actually get into the approval of specific tech specs, nor
10 do we, of course, ever write tech specs in an initial
11 decision.

12 It seems to me -- and this is not a ruling or
13 anything. I'm just trying to open it up for discussion. It
14 seems to me that the appropriate place to challenge adequacy
15 of tech specs is when they do not -- when they are issued
16 after the hearing if they do not comport with conditions set
17 out by the Board and approved by the Commission. Then you
18 have a show cause opportunity, but it just does not seem to
19 me to be an appropriate part of the initial decision itself,
20 but I do not know.

21 We will hear argument on it. I call upon my
22 experience and the experience of others. I just do not
23 recall that being a judicial NRC procedure, if I understand
24 correctly what you are asking for.

25 MR. TROWBRIDGE: Mr. Chairman, I would like to

1 point out that this suggestion comes extraordinarily late in
2 the game. If this had been important to UCS we should have
3 heard about it many months ago.

4 The Board has been allowed to estimate a hearing
5 schedule to the Commission. The Board invited comments from
6 all of the parties on what the hearing schedule might be.
7 Had anyone mentioned technical specifications had to be
8 prepared and signed off, April 30 would have been a
9 ridiculous date. So would May 30.

10 CHAIRMAN SMITH: Well, that is generally the
11 Board's view of it. And if you want to move us from that
12 view, I guess the ball is over there for you to do it.

13 DR. JORDAN: Could I ask a question of the
14 Licensee? There will be -- you do have proposed tech specs
15 now. Are those not subject to challenge. If they do not
16 meet the requirements of the Commission's orders, then they
17 would be subject to challenge at this time.

18 MR. TROWBRIDGE: They could have been. There was
19 ample opportunity to do that.

20 MR. BAXTER: The requirements are going to be set
21 by this Board in its initial decision to a certain extent
22 and then by the Commission.

23 DR. JORDAN: Yes.

24 CHAIRMAN SMITH: That is another reason for what
25 the tradition has been is sometimes the requirements of tech

1 specs are not known until the initial decision issues,
2 except that there are many tech specs which are not at issue
3 in the case. Maybe you are referring to those.

4 MR. POLLARD: Yes, I understand now. I think this
5 discussion has been helpful. Thank you.

6 DR. JORDAN: I might ask the Staff is there a
7 similar situation with respect to other B&W plants, that
8 although the modifications have been made, the tech specs
9 still remain to be finalized?

10 MR. CUTCHIN: Dr. Jordan, I am not aware that that
11 is the case. I believe that any time there was a design
12 modification with approval for continued operation, the tech
13 spec reflecting the existence of the modification had to be
14 in being at the time of operation with that modification in
15 place. However, I might suggest that for a look at types of
16 technical specifications that were the subject of the I&E
17 bulletin, those appear at pages C-2-14 and 15 of the NUREG
18 Report 0680, and they are very specific.

19 In many instances they say that the change, for
20 example, will be added reducing existing high pressure
21 reactor trip set point from 2390 to 2300, and if someone
22 wants to argue whether 90 psi is the appropriate change,
23 that has been in the record now since June of 1980. Many
24 others are equally specific. So it is difficult to see what
25 a problem could be with those types of specifics.

1 We are not rewriting the total tech specs for the
2 plant. They are going to address specific design
3 modifications that came out of compliance with the
4 Commission's orders or whatever the Board might decide to
5 impose.

6 DR. LITTLE: Mr. Dornsife, there is one item that
7 we would like to have taken care of prior to the emergency
8 planning testimony by several people with the Commonwealth.
9 In reviewing the professional qualifications statements,
10 particularly of Mr. Lothrop and Mr. Lamazin, and to some
11 extent General Smith, we found that there was not sufficient
12 detail to make an opinion on their qualifications to do the
13 jobs that they are doing. For example, it says -- some of
14 them would say "I was a professional military man" with no
15 indication of what type of rank and what branch of service
16 and what job functions were involved and that sort of thing.

17 We would like a more specific resume for those
18 three people. The ones from Ms. Riley and Mrs. Cox and
19 several others appeared to be okay.

20 CHAIRMAN SMITH: You may proceed, Mr. Pollard.
21 Whereupon,

22 JAMES CURRY

23 AND

24 JARED WERMIEL

25 the witnesses on the stand at the time of recess, resumed

1 the stand and were further examined and testified as follows:

2 CROSS EXAMINATION - Resumed

3 BY MR. POLLARD:

4 Q If we could return briefly, Mr. Wermiel, to our
5 discussion yesterday of the use of emergency feedwater flow
6 indications to the steam generators and its role in
7 controlling the level in steam generators. This was
8 addressed on page 3 of your testimony.

9 If I recall correctly, yesterday you testified to
10 the effect that the emergency feedwater flow instrumentation
11 was not needed to manually control the steam generator
12 level, is that correct?

13 A (WITNESS WERMIEL) I do not believe that is what I
14 said entirely. I believe what I said was to control level
15 in the steam generator the operator would prefer to use his
16 level indication as opposed to flow indication from the
17 pump, because if he used the flow indication he must infer
18 what his level would be instead of getting a direct
19 indication.

20 Q Okay. Have you reviewed or had occasion to examine
21 the basic design of automatic steam generator level control
22 systems?

23 A (WITNESS WERMIEL) No, I have not.

24 Q If you were told that one of the input signals to
25 an automatic level control system was feedwater flow

1 indication or feedwater flow measurement, do you think that
2 might change your opinion as to the usefulness of flow
3 indication for the operator in controlling level?

4 A (WITNESS WERMIEL) No, I do not think so because an
5 automatic indication can be done quite quickly by a
6 comparator or some device like that. The operator, I think,
7 would require some time to assimilate that kind of
8 information and then make the appropriate adjustment.

9 Q You would agree with me that emergency feedwater is
10 not heated as the normal feedwater is, is that correct?

11 A (WITNESS WERMIEL) Emergency feedwater is not
12 heated?

13 Q That is right.

14 A (WITNESS WERMIEL) No, it is not heated, that is
15 correct.

16 Q And that if you added cold, relatively cold water
17 to the water which is boiling in the steam generator, would
18 that not initially cause a decrease in the level by
19 collapsing the steam voids?

20 A (WITNESS WERMIEL) Yes, it would.

21 Q So that if he was relying upon his level indication
22 and increased feedwater flow, he might see a decrease in
23 level.

24 A (WITNESS WERMIEL) He might, yes.

25 DR. JORDAN: Mr. Wermiel, I guess I am a little

1 confused. You said that the operator would probably watch
2 his level indication primarily, but would he not want the
3 flow indication in helping him arrive at the proper level?
4 Isn't that an important adjunct to the operator?

5 WITNESS WERMIEL: Yes, it is. I did not mean to
6 imply it was not important or he would not use it, not at
7 all. I just -- what I meant to say was if he is controlling
8 level in the steam generator, I believe he will be more
9 interested in his level instrument directly.

10 DR. JORDAN: All right. Okay.

11 (Pause.)

12 BY MR. POLLARD: (Resuming)

13 Q Will there be safety grade emergency feedwater flow
14 indication at the time of restart?

15 A (WITNESS WERMIEL) Yes, there will be.

16 Q Okay. When we terminated yesterday we were
17 discussing the level indication for the condensate storage
18 tanks which is discussed beginning on page 6 of your
19 testimony under item III, which refers us to item II.A.2.i
20 which is on page 21 of your testimony. And under the
21 comment section there you say that "The fully redundant
22 condensate storage tank level arrangement is scheduled for
23 implementation by January 1, 1982 in accordance with
24 NUREG-0737 longterm requirements."

25 Can you tell me, please, where specifically in

1 NUREG-0737 it establishes a January 1, '82 date for
2 redundant condensate storage tank level?

3 A (WITNESS WERMIEL) In NUREG-0737 under item
4 II.E.1.1, the longterm implementation date for operating
5 reactors is identified as January 1, 1982.

6 Q Yes, sir. My question is where is -- I mean, in
7 item II.E.1.1 can you point to me to show where that item
8 addresses condensate storage tank level?

9 A (WITNESS WERMIEL) It does not. All the longterm
10 items under II.E.1.1 are lumped together. The specific
11 items are not identified in 0737 individually.

12 Q Can you tell me then where is the documentation
13 which says this particular requirement is a longterm
14 requirement rather than a shortterm requirement?

15 A (WITNESS WERMIEL) I do not know of documentation.
16 This is the Staff's practice for this particular item.

17 Q What makes it a longterm item?

18 A (WITNESS WERMIEL) We have found that equipment
19 delivery is a severe impact. Instrumentation delivery has
20 been a very severe problem in a number of cases, and in the
21 cases where plants have safety grade primary source of
22 water, the instrumentation they want to provide they want to
23 meet the qualification of the primary source. In other
24 words, they want to provide safety grade indication, and the
25 safety grade instrumentation required has equipment delivery

1 impact problems. This is what we have found.

2 In cases where the primary water source has not
3 been a safety grade source, an off-the-shelf instrument can
4 be provided, and this is a simpler thing to get.

5 DR. JORDAN: Was this identified as a shortterm
6 item in NUREG-0578?

7 WITNESS WERMIEL: It is not identified in
8 NUREG-0578 at all. It is not a Lessons Learned item. This
9 comes out of the NUREG-0611 and NUREG-0635 reviews and is
10 identified, I believe, as additional shortterm item number
11 one in the table.

12 BY MR. POLLARD: (Resuming)

13 Q You have led, of course, to the next question.
14 Under the comments section on page 21 of your testimony you
15 call this a longterm requirement, but over on the left you
16 call it a shortterm requirement. And if I understand your
17 testimony just now, am I correct that the principal basis
18 that the NRC is using to decide whether a requirement should
19 be accomplished in the shortterm or the longterm is one of
20 practicality rather than based upon any assessment of the
21 safety significance?

22 A (WITNESS WERMIEL) No, sir. We assess the safety
23 significance of all shortterm and longterm items. The
24 shortterm items were meant for immediate or very shortterm
25 implementation. In the case of redundant level indication

1 we recognized that there is presently level indication on
2 both condensate storage tanks, that its impact on overall
3 system reliability was not great, and therefore, we
4 recognized that since there are these problems with
5 equipment delivery and such that we could grant a stay or a
6 time period, interim time period where the item did not have
7 to be implemented if there were problems in doing that.

8 (Counsel for UCS conferring.)

9 Q Were there any items among the requirements for
10 emergency feedwater systems that the Staff has considered so
11 vital that they would require them to be implemented prior
12 to restart even if there were equipment availability
13 problems?

14 A (WITNESS WERMIEL) I do not --

15 CHAIRMAN SMITH: What are the bounds of your
16 question?

17 MR. POLLARD: Of all the requirements applicable to
18 emergency feedwater systems.

19 WITNESS WERMIEL: I do not recall any offhand. I
20 do not -- I cannot think of any at this time.

21 BY MR. POLLARD: (Resuming)

22 Q What compensating features or compensating actions
23 have been taken to justify allowing restart without the
24 redundant safety grade level indication for the primary
25 water source at TMI-1?

1 A (WITNESS WERMIEL) A compensating feature? The
2 fact that there is indication on the primary source now, the
3 fact that there are actually two tanks, that there are
4 backup water supplies, backup procedures, and procedures for
5 utilizing the backup water supplies we felt for the
6 shortterm were sufficient.

7 Q So it is again a question of the level of risks
8 posed by the present design as to how long you are going to
9 allow that level of risk to persist.

10 A (WITNESS WERMIEL) And the fact that when we view
11 it in the overall system point reliability its impact is not
12 severe.

13 Q But it is severe enough that you are unwilling to
14 let the plant operate for the rest of its design lifetime in
15 this configuration.

16 A (WITNESS WERMIEL) Yes. We feel this is a feature
17 that should be incorporated in the design because it has
18 merit.

19 (Counsel for UCS conferring.)

20 Q In the Staff's determination that eventually they
21 should have to have safety grade redundant level indication
22 for the primary source of water for emergency feedwater at
23 TMI-1 did the Staff make the finding that the provision of
24 that instrumentation would provide substantial additional
25 protection which is required for the public health and

1 safety?

2 I am reading from the regulations of 50.109 which
3 is entitled "Backfitting," which says under what conditions
4 the Commission may require backfitting of a facility.

5 A (WITNESS WERMIEL) No, I do not believe reference
6 to that part of 10 CFR 50 was in the thinking process.

7 Q Well, I am not asking whether you specifically
8 considered this regulation. My question is will the
9 provision of this instrumentation provide substantial
10 additional protection for the public health and safety?

11 A (WITNESS WERMIEL) I do not know how to define the
12 word "substantial." I believe I just said its impact in the
13 overall reliability of the system is not that great. So
14 again, I cannot put bounds on the word "substantial," and I
15 do not know how to answer that question.

16 Q Let me ask it a different way. Suppose -- make the
17 assumption that after restart occurs Metropolitan Edison
18 comes back to the Staff and says we are not going to put in
19 the redundant level instrumentation on the condensate
20 storage tank.

21 Do you consider that instrumentation -- that
22 requirement to be so solid a requirement that you would then
23 order the plant shut down?

24 A (WITNESS WERMIEL) I think we would have to take
25 that particular point under advisement and consider it on a

1 case by case basis for this particular plant. We would want
2 justification for why they do not propose to do it when we
3 have asked for it, and then we would make our -- use our
4 engineering judgment to determine if that justification
5 warranted their case.

6 Q But I am correct as far as the information you now
7 have available to you and the decisions the staff has made,
8 you have decided that this is a requirement that must be
9 implemented in the longterm.

10 A (WITNESS WERMIEL) Yes, sir. And we --

11 Q But you are not willing to say that the basis for
12 providing it must be implemented is it would provide
13 substantial additional protection for the public?

14 A (WITNESS WERMIEL) I just do not know that that was
15 what was involved when this particular item was created. I
16 did not develop the criteria, and I do not know what the
17 people that did were thinking.

18 I know that we have decided that it does provide a
19 measure of additional capability to the operator which we
20 feel is -- it has merit.

21 Q Do you know of any other legal authority or
22 regulations which give the NRC the authority to impose
23 additional requirements without making the finding that it
24 would provide substantial additional protection for the
25 health and safety of the public?

1 MR. CUTCHIN: I object, Mr. Chairman. If he is
2 asking for a legal interpretation, I think the question
3 should be directed to one who could give a legal
4 interpretation.

5 CHAIRMAN SMITH: If in the performance of his
6 duties he has to make a determination as to -- or act under
7 advice as to what is legally within the Commission's purview
8 to enforce, then he can answer. If he does not know, then
9 he can say that.

10 WITNESS WERMIEL: I really do not know what is in
11 the purview of the Commission's enforcement policy for
12 backfits. I know we at times in our licensing we recommend
13 backfits, and we review them, as I have said, with our
14 engineering judgment on a case by case basis, and we right
15 safety evaluations which are reviewed by other staff people
16 and eventually go to the Commission for concurrence.

17 That is basically what I do, and that is my
18 understanding of the process.

19 (Counsel for UCS conferring.)

20 BY MR. POLLARD: (Resuming)

21 Q When you make a recommendation for a change in
22 design or a backfit, do you make that recommendation on the
23 basis that it would provide substantial additional
24 protection for the public, or do you make that
25 recommendation just on anything that has merit that would

1 result in an improvement?

2 A (WITNESS WERMIEL) No. We make the recommendation
3 that the public health and safety would be improved. The
4 word "substantial" I find so subjective and such a measure
5 of degree that it is argumentative, you know, and we make --
6 we make judgments, and of course we would review it then, if
7 that is the way the regulation reads, as a substantial
8 improvement.

9 In other words, we are not making recommendations
10 lightly. We would do it because health and safety would be
11 improved, we feel

12 BY MS. WEISS:

13 Q Do you have any idea how many backfit orders go out
14 to operating plants in a year?

15 A (WITNESS WERMIEL) Absolutely no idea.

16 Q It's a very rare thing, isn't it?

17 A (WITNESS WERMIEL) Not lately it has not been, not
18 at all.

19 Q It is not something --

20 DR. JORDAN: I missed the question.

21 BY MS. WEISS: (Resuming)

22 Q I am trying to get a fix for whether it is normal
23 operating procedure at the NRC to issue backfit orders any
24 time you think that safety at the plant might be improved.

25 A (WITNESS WERMIEL) We are constantly reviewing

1 plants at different stages for backfits, and we make backfit
2 recommendations. Lately, of course, we have made quite a
3 few.

4 Q Would you say there was a fairly high standard of
5 improvement, that you do not issue a backfit order to an
6 operating plant any time you think the safety can be
7 improved somewhat?

8 MR. BAXTER: Mr. Chairman, I object to the
9 materiality of this line of questioning. We have no
10 indication that the Licensee is not going to implement this
11 requirement, and it is clearly stated by the witness that it
12 is a requirement that the Staff has imposed, and why they
13 have imposed it and what degree of improvement he thinks is
14 going to come from it. Why the exploration of a legal
15 authority is beyond me.

16 CHAIRMAN SMITH: I think your objection may be
17 sustainable now. However, if the concept is not explored by
18 Ms. Weiss, it is going to be explored by the Board when we
19 try to determine what the basis is for deferring the safety
20 grade automatic initiation. So the same questions will be
21 relevant then. As a matter of fact, I have been waiting for
22 a hiatus in their examination to ask some questions of the
23 Board on this area. I think your objection is correct; that
24 is the state of the record.

25 On this one particular item if it is not at issue,

1 well, all right, then we will sustain the objection; but the
2 general line of questioning will come up again, I am sure.

3 MS. WEISS: I am just as happy to let the Board
4 bring it up.

5 WITNESS WERMIEL: I would like to make an overall
6 statement. You know, we are concentrating on one item, and
7 we have been looking, the Staff has looked at emergency
8 feedwater system reliability. This is a part of the overall
9 upgrade of reliability and is a part of a number of
10 backfits; therefore, we consider the improvement in
11 reliability a substantial improvement or benefit to public
12 health and safety, this being a part of that. In and of
13 itself I do not know that I would characterize it as such.

14 BY MS. WEISS: (Resuming)

15 Q Well, the questions I was just asking you were
16 general questions, and they did not go --

17 A (WITNESS WERMIEL) Okay.

18 Q Precisely to this amendment, but the question that
19 is on my mind and I think is on the Board's mind at the
20 moment is after you impose backfit order, and I think we
21 would all agree that that is a significant action which is
22 not taken lightly --

23 A (WITNESS WERMIEL) Yes.

24 Q And it includes deadlines, as it did in this case,
25 and deadlines prior to restart. The plant is down until

1 certain things are accomplished.

2 I would like to have some feel that you have
3 criteria for waiving those, that they are not infinitely
4 flexible based upon what Mr. Pollard referred to as
5 practicalities. Please feel free to comment on that if you
6 would like to.

7 A (WITNESS WERMIEL) As I said, you know, we felt
8 that the protection provided by the existing design, this
9 particular item was such that on an interim basis the
10 implementation of this was not immediately required in the
11 short term, and that was the judgment that we used.

12 Q Well, we are also against this backdrop. We are
13 also considering the emergency feedwater automatic
14 initiation.

15 A (WITNESS WERMIEL) Yes, we are.

16 Q And many other items. So can you give me an idea
17 if you have some general criteria by which you judge, for
18 example, if Licensee comes to you three weeks ago -- I think
19 there was a meeting in Mr. Ross' office which you may have
20 attended, Mr. Denwood Ross.

21 CHAIRMAN SMITH: Ms. Weiss, we -- Mr. Ross was
22 present and discussing in general NUREG-0737 items, and in
23 particular water level indication in the reactor vessel
24 where the same debate has come up, and I might commend that
25 for your reading. And I urge you to continue your inquiry,

1 because there are confusing items open there as far as the
2 Board is concerned.

3 BY MS. WEISS: (Resuming)

4 Q Well, the question simply was that it has happened
5 in the past in this case, and I think it is reasonable to
6 anticipate that it will happen in the future that the
7 Licensee will come to you and say we have problems with
8 meeting this deadline; can you give us six months or until
9 the next refueling or whatever.

10 Are there some criteria by which you are going to
11 judge those requests?

12 A (WITNESS WERMIEL) I think generally we would, as I
13 say, study these particular items on a case basis for this
14 particular plant. We would look at what is provided as a
15 backup, say, to the implementation of the particular
16 concern. We would look to see based on our engineering
17 judgment whether that backup provides sufficient assurance
18 of maintaining the public health and safety on an interim
19 basis.

20 We may even ask for a numerical probabilistic
21 approach to our decision to make that -- to decide that from
22 a probability standpoint the particular item can be delayed,
23 that sufficient defense in depth is available in the current
24 plant arrangement to allow the delay.

25 CHAIRMAN SMITH: How about cost effectiveness? In

1 the first instance do you take that into account?

2 WITNESS WERMIEL: We have not, at least in my
3 knowledge, ever assessed cost in our licensing practice that
4 I am aware of in my work.

5 CHAIRMAN SMITH: You would --

6 WITNESS WERMIEL: Indirectly I suppose cost is a
7 concern, because if an item requires the plant to be shut
8 down, then cost is certainly a concern because every time --
9 every day the plant is shut down is a substantial burden on
10 the utility. So I believe it is only indirectly that this
11 particular type of cost is assimilated in the licensing
12 practice.

13 DR. JORDAN: This topic, of course, will be pursued
14 more generally by the Board when we get to discussions of
15 the improvement of all the items from the restart design and
16 its estimated probability Mr. Pollard referred to yesterday,
17 and whether the probability estimates with restart are
18 really high enough, and so it is -- as I say, we will
19 discuss the totality, but the Board will not be involved
20 with the individual things. However, that does not prevent
21 Mr. Pollard from looking at the individual items.

22 WITNESS WERMIEL: I understand.

23 CHAIRMAN SMITH: Ms. Weiss, I interrupted you to
24 point out that we had Dr. Ross, and I forgot to ever get to
25 my point on it, so if you thought it was a pointless

1 interruption, it was.

2 I do commend the reading of the transcript on that,
3 and recognizing who Dr. Ross is and what his
4 responsibilities are, you have to take into account that
5 this witness may not be at the level where those judgments
6 are made. However, I still urge you to determine to the
7 extent that you can what he does know about it.

8 MS. WEISS: A gratuitous comment is on the way, but
9 I have noticed that sometimes there is a disjunction between
10 the person who makes the decision and the person who knows
11 the information upon which the decision is based. And I
12 generally would rather have the latter, and I think I
13 probably do.

14 BY MS. WEISS: (Resuming)

15 Q You mentioned as one criterion you look at what
16 exists to back up the system, and I think Mr. Pollard will
17 pursue that with respect to backups to the condensate
18 storage tank level indication. But I wanted to pursue just
19 a bit on backup to automatic initiation of emergency
20 feedwater.

21 Would it be generally accurate to characterize your
22 testimony yesterday as having stated the opinion that bleed
23 and feed provides the requisite backup, at least in the
24 interim, which compensates for emergency feedwater automatic
25 initiation?

1 A (WITNESS WERMIEL) That is part of it. In the
2 event the existing automatic initiation system did fail,
3 feed and bleed is part of the backup. Further backup is
4 provided by the operator's capability to manually compensate
5 for the failure that might compromise his ability to deliver
6 emergency feedwater flow, and the time period in which he
7 can take action which we deem to be sufficient.

8 Q Within five minutes?

9 A (WITNESS WERMIEL) No. He has 20 minutes by
10 analysis as a minimum now.

11 Q So you have defined success differently for
12 purposes of that analysis than you have for Mr. Curry's
13 analysis of success, emergency feedwater initiation.

14 A (WITNESS WERMIEL) Mr. Curry has already testified
15 that he looked at a specific case, a five minute case. He
16 did not look at recovery capability over a 20-minute period,
17 and I believe that is on the record.

18 Q Have you analyzed the capability of an operator to
19 recover within 20 minutes any of these scenarios that Mr.
20 Curry presents -- the loss of offsite power, loss of DC
21 power, loss of AC power, loss of main feedwater?

22 A (WITNESS CURRY) I have not, no.

23 Q Do you know?

24 A (WITNESS CURRY) I believe in the B&W reliability
25 study, that is, BAW 1584, the 15-minute and 30-minute cases

1 are discussed and described, and there is some credit for
2 recovery included in there.

3 (Counsel for UCS conferring.)

4 Q And is it still accurate that the Staff has not
5 received or reviewed a detailed description from the
6 Licensee of the bleed and feed mode of cooling, that the
7 equipment used and the measures required and the procedures
8 required to manipulate?

9 A (WITNESS WERMIEL) I am not familiar to the extent
10 that we have reviewed feed and bleed. I believe I said on
11 the record that we have not seen an analysis of the decay
12 heat removal capability over an extended period of time for
13 the feed and bleed mode.

14 Q Maybe the best way to ask it is whether there has
15 been any change since the time Mr. Jensen testified with
16 respect to what the Staff has reviewed?

17 A (WITNESS WERMIEL) Not that I am aware of.

18 Q The Board has already expressed the opinion that
19 they are interested in the general things. I have an easier
20 time understanding it when I focus on some specifics. I
21 would just like to pursue for one moment or so the level
22 indication on the condensate storage tank where we are now
23 concerned about the primary water supply for the emergency
24 feedwater pumps.

25 And if I heard you correctly, you said part of the

1 consideration of the backups available to compensate for not
2 having fully redundant safety grade level indication at the
3 time of restart was the availability of other water supplies.

4 A (WITNESS WERMIEL) Yes.

5 Q That is correct. Now, in your review of the
6 emergency procedures for transferring the source of water,
7 is it not correct that one of the principal indications that
8 the operator will use to decide whether to transfer to the
9 alternate water supply is specifically the condensate level
10 instrumentation?

11 A (WITNESS WERMIEL) Yes, it is.

12 Q Well, if it is the instrumentation itself which is
13 not fully complying with your longterm requirements at the
14 time of restart and it is that instrumentation which the
15 operator will use to determine whether to transfer to the
16 alternate water sources, I have difficulty understanding how
17 the alternate water sources can be a compensating feature
18 for not having the level instrumentation.

19 A (WITNESS WERMIEL) If the level instrument should
20 fail, he will know that he must get an alternate source. It
21 will indicate that he has no level in the condensate storage
22 tank and therefore must recover from that.

23 Q Well, but you have -- what particular type of
24 failure mode did you assume when you just made that
25 statement?

1 A (WITNESS WERMIEL) Perhaps the power supply to the
2 instruments have failed.

3 Q All right. So can you discuss a failure of the
4 level instrument which indicates adequate water in the
5 condensate storage tank when in fact there is a decreasing
6 level or inadequate water to provide a positive suction head
7 for the pumps?

8 A (WITNESS WERMIEL) He does have two indicators, one
9 on each tank, so I would assume if he got divergent readings
10 from them, he would question the one or the other in an
11 attempt to find out which one is correctly indicating the
12 level.

13 Q Are the levels for the two condensate storage tanks
14 always the same?

15 A (WITNESS WERMIEL) I believe they are supposed to
16 be, yes. There is a reserve volume in each tank that is the
17 same, 150,000 gallons in each tank.

18 Q Yes, but when we are taking water out of the tanks,
19 do the level of the two tanks decrease in step, that they
20 both are going down always at the same level?

21 A (WITNESS WERMIEL) The tanks do float on the
22 system, and they are not supposed to be isolated one from
23 the other normally.

24 Q I see. Is this the existing instrumentation safety
25 grade with the exception of being not redundant on each tank?

1 A (WITNESS WERMIEL) I do not recall offhand if it is
2 fully safety grade. I could not say.

3 Q Will the operability of that instrumentation be a
4 limiting condition for operation in the tech specs?

5 A (WITNESS WERMIEL) I believe there are limiting
6 conditions concerning the volume of water in the tank.

7 Q That was not my question. Is the operability of
8 the level instruments going to be a limiting condition for
9 operation?

10 A (WITNESS WERMIEL) I do not recall.

11 Q Do you think it should be?

12 A (WITNESS WERMIEL) I would say that once the
13 redundancy is provided that certainly some operability
14 requirement or action statement should be implemented.

15 Q I am not -- let me see if I can -- I am sorry. Let
16 me phrase the question more specifically. It is my fault.
17 At the time of restart when we will not have redundant level
18 instrumentation on the condensate storage tank do you
19 believe the operability of the instrumentation which will be
20 provided at restart should be the subject of a limiting
21 condition for operation?

22 A (WITNESS WERMIEL) I believe so, yes, because then
23 he could not verify that he is meeting his tech spec
24 requirement for providing the required level.

25 Q Nor could he decide when he needed to switch to an

1 alternate water supply.

2 A (WITNESS WERMIEL) That is true.

3 Q Thank you.

4 If we can move on now to -- I'm sorry.

5 DR. JORDAN: A little clarification.

6 WITNESS WERMIEL: Yes, sir.

7 DR. JORDAN: The two tanks, A and B, I see on your
8 diagram are connected all right, but are the valves open so
9 that the two levels do remain the same?

10 WITNESS WERMIEL: They are supposed to be, yes,
11 sir, and they are supposed to be locked open.

12 DR. JORDAN: I see. Okay. That I had not
13 understood. And then you say there is a level indication
14 for each tank.

15 WITNESS WERMIEL: Yes, sir. Yes, sir, there is.

16 DR. JORDAN: All right. Eventually that will be
17 redundant information on each tank.

18 WITNESS WERMIEL: Yes, sir.

19 DR. JORDAN: Is it continuous information on level
20 that is redundant, and is there then a low level alarm? Is
21 that the way it works?

22 WITNESS WERMIEL: Yes, sir, there is. That is
23 correct.

24 DR. JORDAN: All right. That is fine.

25 BY MR. POLLARD: (Resuming)

1 Q Now, all of the backups that we have just discussed
2 for this condensate level in terms of the alternate water
3 supplies, in terms of bleed and feed, all of those
4 alternatives will still be available after the redundant
5 instrumentation is installed, isn't that correct?

6 A (WITNESS WERMIEL) Oh, yes.

7 Q You do not intend to relax the requirements.

8 A (WITNESS WERMIEL) No, sir.

9 Q So then I am correct that these alternatives are
10 not something that have been added to compensate for the
11 lack of redundant information. It is just that you
12 considered their existence in deciding to allow restart
13 without the redundant level instrumentation.

14 A (WITNESS WERMIEL) That is correct.

15 Q Okay. I am referring now to item 4 on the top of
16 page 7 of your testimony. About the middle of the paragraph
17 you refer to recent Licensee event reports indicating the
18 need to improve the quality of system testing and
19 maintenance.

20 How recent are those LERs?

21 A (WITNESS WERMIEL) That again is a statement that
22 comes out of NUREG-0611, and I believe the LERs in question
23 there are for a time period just prior to publishing of that
24 document. I am not familiar with the exact dates for that
25 time period.

1 Q Can you help me and tell me about when 0611 was
2 published?

3 A (WITNESS WERMIEL) Let me think a minute. I
4 believe it was published in approximately the fall of '79
5 sometime, late '70.

6 Q And this was after the other B&W plants had been
7 permitted to resume operation, is that correct?

8 A (WITNESS WERMIEL) Yes, I believe so.

9 Q Did these Licensee event reports indicate
10 deficiencies in the changes that had been required in the
11 short term which were the basis for allowing the B&W plants
12 to restart?

13 MR. BAXTER: I am sorry. I am confused. I
14 understood 0611 was a report on Westinghouse plants.

15 WITNESS WERMIEL: It is.

16 WITNESS CURRY: That is correct.

17 MR. POLLARD: Okay. I am sorry.

18 BY MR. POLLARD: (Resuming)

19 Q Let me slow down. Again, what my concern is that
20 on page 3 of your testimony you are describing the changes
21 that have been made, or actually it begins on page 2, about
22 the bulletins imposed the following specific requirements
23 related to emergency feedwater systems, and then you discuss
24 the administrative measures about making sure that valves --
25 periodic checks of proper valve positions, revising

1 procedures to assure that emergency feedwater system valves
2 are returned to their proper operation -- position following
3 testing, revising the tech specs, informing plant personnel,
4 and operating and maintenance personnel of the seriousness
5 and consequences of simultaneously blocking, and then you
6 say these administrative measures improve the availability
7 of the emergency feedwater system to function on demand.

8 Then when we get to page 7 you refer to these
9 recent LERs which indicate the need to improve the quality
10 of system testing and maintenance. And basically my
11 question is did those Licensee event reports occur after the
12 changes on page 3 of your testimony had been implemented?

13 A (WITNESS WERMIEL) I do not think so. The B&W
14 plants were shut down at the time NUREG-0611 was being
15 compiled.

16 Q But what about the Westinghouse plants that the
17 report is written on? Have they been required to modify
18 their surveillance and testing procedures?

19 A (WITNESS WERMIEL) Yes, they have.

20 Q But nevertheless, these Licensee event reports
21 indicated the need to improve the quality of system testing
22 and maintenance.

23 A (WITNESS WERMIEL) Yes, they did.

24 Q You then continue saying, "Specifically, periodic
25 testing and maintenance procedures inadvertently result in,

1 one, more than one emergency feedwater system flow train
2 being unavailable during test."

3 Let me stop there and jump down. And then you say,
4 "The Office of Inspection and Enforcement has taken action
5 to correct item 1." What specific action did the Office of
6 Inspection and Enforcement take?

7 A (WITNESS WERMIEL) My understanding of what they
8 did was to review plant test procedures, periodic test
9 procedures to verify that all testing of emergency feedwater
10 system flow trains was done on a staggered basis, and that
11 if that was not the case, measures were taken to correct
12 that.

13 Q Okay, then, returning back now to the item 2 about
14 the testing and maintenance procedures inadvertently result
15 in the emergency feedwater system flow train under test not
16 being properly restored to its operational condition
17 following the test or maintenance, later you say concerning
18 item 2 Licensees were required to confirm flow path
19 availability of an emergency feedwater system flow train
20 that has been out of service to perform periodic testing or
21 maintenance.

22 When you say Licensees were required, were they
23 required to do that before or after the recent Licensee
24 event reports that you refer to earlier?

25 A (WITNESS WERMIEL) This is a requirement that came

1 after those LERs, and I believe it is based on those LERs.

2 Q And where is that requirement set forth?

3 A (WITNESS WERMIEL) This is all discussion from
4 NUREG-0611 which is part of item II.E.1.1 of NUREG-0737.

5 DR. JORDAN: Was this included in the bulletins and
6 orders?

7 WITNESS WERMIEL: It was part of the bulletins and
8 orders task force review, yes, sir. I believe the heading
9 for this whole section of my testimony is B&C task force
10 review. Yes, it is.

11 BY MR. POLLARD: (Resuming)

12 Q Now, the corrective action that has been taken, as
13 I understand your testimony, is to implement procedures
14 which require an operator to determine that emergency
15 feedwater system valves are properly aligned, and a second
16 operator to independently verify that the valves are
17 properly aligned.

18 My question is why rather than simply checking
19 valve positions you have not required an actual flow test of
20 the system?

21 A (WITNESS WERMIEL) We have. That is the next item.

22 Q Well, but that is not done except after an extended
23 outage. What I am concerned about is the periodic tests of
24 emergency feedwater which require manipulation of valves.
25 Simply going back and looking at a handwheel to see whether

1 the valve is open or not in my view is not as reliable as
2 actually performing a flow test. Would you agree with that?

3 A (WITNESS WERMIEL) I would agree, but I do not
4 agree that a flow test is necessarily a practical thing to
5 do while the plant is operating.

6 Q Can you explain to me why not?

7 A (WITNESS WERMIEL) Well, injecting the cold
8 emergency feedwater into the steam generator at 10 percent
9 power might result in some excursion to the system that
10 would be unacceptable or unsafe even.

11 Q Has the Staff examined that to determine whether it
12 might or might not be the case?

13 A (WITNESS WERMIEL) I am not aware that we have
14 looked into it in detail, no. I am also aware -- I mean, in
15 some cases it might not even be possible to do that. I am
16 trying to think of system configurations, and I may be
17 wrong, but I --

18 Q When you say it might not be possible are you
19 talking about Three Mile Island Unit 1?

20 A (WITNESS WERMIEL) No, no, I am not talking about
21 Three Mile Island Unit 1.

22 Q So that if I understand, Three Mile Unit 1, you
23 think inadvertent actuation of emergency feedwater might
24 pose a safety hazard.

25 A (WITNESS WERMIEL) Inadvertent actuation of

1 emergency feedwater? I do not know that it might result in
2 a safety hazard. I do know that it might result in an
3 excursion that would have to be compensated for, and I do
4 not know what the ramifications of that are.

5 Q So then am I correct in concluding that you have
6 not done an analysis to weigh the benefits and the risk of
7 requiring the performance of a flow test?

8 A (WITNESS WERMIEL) No, I have not.

9 Q Has anyone on the staff done that to your knowledge?

10 A (WITNESS WERMIEL) Not that I am aware of.

11 Q Are you familiar with past failures where although
12 the valve operator indicated the valve was open, the
13 mechanical failure of the valve had in fact occurred, and
14 the flow path was blocked?

15 (Panel of witnesses conferring.)

16 A (WITNESS WERMIEL) Yes, I could see where that
17 could be a possibility, yes.

18 Q If we could move now to the top of page 9 of your
19 testimony where you are talking about the independence of
20 the turbine-driven pump train from AC power. Is this AC
21 independent air supply safety grade?

22 A (WITNESS WERMIEL) Yes, I believe it is.

23 Q Will it be the subject of a limiting condition
24 operation in the technical specifications?

25 A (WITNESS WERMIEL) I do not recall if it is or not.

1 Q Do you think it should be?

2 A (WITNESS WERMIEL) It is a passive component, so I
3 am not sure how its operability will be verified, but I
4 would say yes, if there was something that would fall within
5 the realm of tech specs, then it should be included, yes.

6 Q Now, moving on to page 9, the bottom, where we now
7 begin your testimony on the Lessons Learned review, and in
8 the middle of that paragraph you are talking about the need
9 for automatically initiating emergency feedwater system, and
10 you are discussing this in the context of satisfying or
11 consistent with satisfying the requirements of General
12 Design Criterion 20.

13 Is it the Staff's position that the emergency
14 feedwater system must comply with General Design Criterion
15 20? .

16 A (WITNESS WERMIEL) It is currently our practice
17 that it must, yes.

18 Q But that it need not require -- it need not comply
19 with General Design Criterion 20 prior to restart.

20 A (WITNESS WERMIEL) I am not familiar with the
21 details of compliance with GDC 20, and I have not done the
22 reviews against that General Design Criterion.

23 Q Well, this -- I mean, your testimony states that
24 the analysis of feedwater transients and the results of
25 reliability studies of installed emergency feedwater systems

1 pointed out the need for automatically initiating the
2 emergency feedwater system consistent with satisfying the
3 requirements of General Design Criterion 20. And I thought
4 I understood your earlier testimony that the automatic
5 initiation of the emergency feedwater systems for Three Mile
6 Island Unit 1 will not be accomplished prior to restart.

7 A (WITNESS WERMIEL) The safety grade automatic
8 initiation would not, that is right.

9 Q That is correct. So am I correct that at the time
10 of restart Three Mile Island Unit 1 will not meet General
11 Design Criterion 20?

12 A (WITNESS WERMIEL) What I am saying is I do not
13 know that GDC 20 says that automatic initiation systems must
14 be safety grade. I am just not familiar with the details.
15 If that is what is meant by this paragraph from the Lessons
16 Learned NUREG, then what you are saying is correct.

17 Q I do not know if you have it available for
18 reference, General Design Criterion 20, but you have quoted
19 in your testimony the exact words. General Design Criterion
20 20 is entitled "Protection System Functions."

21 "The protection system shall be designed: one, to
22 initiate automatically the operation of appropriate systems,
23 including the reactivity control systems, to assure that
24 specified acceptable fuel design limits are not exceeded as
25 a result of anticipated operational occurrences; and two, to

1 sense accident conditions and to initiate the operation of
2 systems and components important to safety."

3 A (WITNESS WERMIEL) I would infer from that
4 discussion that the TMI-1 system at the time of restart was
5 needed because they will have an automatic initiation of
6 emergency feedwater function.

7 Q But that it will not be safety grade automatic
8 initiation.

9 A (WITNESS WERMIEL) That is correct, and as I was
10 saying, I do not see in that discussion that you've just
11 quoted me where that safety grade is mentioned.

12 (Pause.)

13 CHAIRMAN SMITH: Do you read General Design
14 Criterion 20 to require that the protection system be safety
15 grade or that the system initiated by the protection system
16 be safety -- but that it had the capacity to sense the
17 accident conditions and to initiate the operation of systems
18 and components important to safety?

19 MR. POLLARD: Well, Mr. Chairman, with this
20 particular witness I am trying to avoid going over the
21 discussion that we have had earlier as to whether or not the
22 instrumentation which turns on a particular system is part
23 of that system or part of the protection system.

24 I also do not intend to pursue with this witness
25 whether or not meeting General Design Criterion 20 requires

1 a safety grade system.

2 There is no question in my mind that the
3 instrumentation which turns on emergency feedwater is part
4 of the protection system, and I think the testimony that is
5 on the record already when we talked about safety grade,
6 safety-related, important to safety is adequate in that
7 regard, which is why I did not pursue it here. It is no
8 different from the instrumentation which automatically
9 initiates high pressure injection.

10 CHAIRMAN SMITH: I was just having trouble with the
11 language of Criterion 20 as it fits into your exchange.
12 Criterion 20, if we accept your view that the words
13 "important to safety" are equal to safety grade, Criterion
14 20 says the protection system. It does not say that the
15 protection system would be safety grade, but the protection
16 system shall be designed to sense accident conditions and to
17 initiate the operation of systems, safety grade systems.

18 But I understand, but it just did not seem to fit
19 into this exchange that you are having. The answer and the
20 questions did not seem to match the criteria.

21 MR. POLLARD: I think that is because of the answer
22 I received. This witness thinks GDC 20 can be satisfied by
23 the existing design. I simply decided it is not worth
24 pursuing with this witness.

25 BY MR. POLLARD: (Resuming)

1 Q With respect to the implementation date for the
2 safety grade automatic initiation for the Three Mile Island
3 Unit 1 emergency feedwater systems am I correct that in the
4 series of events that occurred originally, NUREG-0576
5 required this to be accomplished by January 1 of 1981, and
6 then NUREG-0737 required this to be accomplished by July 1
7 of 1981, and in the restart SEP which is Staff Exhibit 1,
8 NUREG-0680, on page C-8-37 the Licensee has proposed a
9 schedule for installation of the fully safety grade longterm
10 design during the first refueling outage after restart.
11 However, the Staff did not accept that and stated that we
12 will require that the fully safety grade modification
13 described above be installed within 60 days after receipt of
14 the required equipment.

15 And if I understood your testimony that we are now
16 discussing, that this could be delayed until the next
17 refueling after restart.

18 A (WITNESS WERMIEL) That is conceivable. A decision
19 has not been made yet.

20

21

22

23

24

25

1 Q But has the staff abandoned their earlier position
2 that it must be installed sixty days after receipt of the
3 equipment?

4 A (WITNESS WERMIEL) I do not know that we have or
5 not. That may still be. That may end up being our
6 position. I am not sure.

7 Q Do you know why the staff rejected the original
8 Licensee proposal of not installing this until the first
9 refueling outage after restart and instead imposed upon them
10 the demand to be installed within sixty days after the
11 receipt of the required equipment?

12 A (WITNESS WERMIEL) I think we felt at the time
13 this was written that it was perhaps important enough where
14 it should be put it as soon as it should be. Unfortunately,
15 I do not know that that particular requirement holds much
16 weight in that if the equipment delivery was delayed until
17 the plant was down for their refueling outage, it never
18 would have been met; that statement never would have been
19 met anyway.

20 Q I understand that, which is the reason I am
21 pursuing another area where I am trying to decide what
22 criteria the staff has that are not, in Ms. Weiss' phrase,
23 infinitely flexible as to when a safety improvement is
24 actually going to be accomplished at TMI-1.

25 A (WITNESS WERMIEL) Again, I think we would weigh

1 all the factors involved in implementing the requirement:
2 whether or not the plant would be shut down, for how long,
3 what the time factor is between the date of equipment
4 delivery and the proposed shutdown for refueling, what is
5 available as backup. All these factors must weigh upon a
6 decision when you are involved with an operating reactor.

7 Q Can you identify for me any new information that
8 the staff has obtained that would result in changing the
9 conclusion that was stated in the restart SER that this was
10 important enough require that the equipment be installed
11 within sixty days after receipt of the equipment?

12 A (WITNESS WERMIEL) I am not aware of any new
13 information, and I am also not aware that the statement will
14 even be changed.

15 (Counsel for UCS conferring.)

16 Q Can you tell me why the staff thought that this
17 requirement was so important that it should be implemented
18 within sixty days after receipt of the equipment, which at
19 that time was estimated to be -- "at that time" meaning the
20 time this SER was written -- that receipt of the equipment
21 was scheduled for March of '81?

22 A (WITNESS WERMIEL) As I indicated before, I
23 believe, and has been shown by Mr. Curry's numbers, this
24 does provide a significant improvement in the immediate
25 reliability of the system. By immediate I mean the

1 automatic availability of the system. And for that reason
2 we felt it should be put in as soon as practical.

3 MR. POLLARD: We have some requests off the record
4 here for a break, Mr. Chairman. This is a convenient
5 breaking point for me.

6 CHAIRMAN SMITH: Fine. Thank you.
7 Let's take a 15-minute morning break.
8 (Recess.)

9 CHAIRMAN SMITH: Are we ready to proceed?
10 Maybe it is helpful for the parties to know about
11 the schedule for limited appearance statements. We do have
12 one scheduled for 1 o'clock and two at 5 o'clock.

13 MR. BAXTER: Mr. Chairman, I was not here during
14 February and March when this routine started evidencing
15 itself. Are there any time limits the Board has set for
16 limited appearance statements in terms of the duration?

17 CHAIRMAN SMITH: No. We recommend that they be
18 held from 5 to 10 minutes, but we have not set an absolute
19 time limit. We will approach that on a case-by-case basis.

20 BY MR. POLLARD:

21 Q Mr. Wermiel, on page 11 of your testimony towards
22 the end of the first paragraph, in fact the last sentence,
23 you talk about resolution of the equipment, environmental
24 and seismic qualification concerns. Is it staff's position
25 that these concerns are required to be resolved before

1 restart?

2 A (WITNESS WERMIEL) I am not aware of the details
3 of the staff's position on equipment -- the environmental
4 qualification of equipment, and I am also not aware of the
5 implementation for the seismic qualification or the concern
6 over potential problems with the seismic qualification. I
7 have not seen the schedule on either of those.

8 (Counsel for UCS conferring.)

9 Q In the staff's safety evaluation report on
10 environmental qualification of safety-related equipment,
11 which was transmitted on March 24 by a letter dated March
12 24, 1981 to Mr. Hukill of Metropolitan Edison, it does
13 include a listing of equipment used in the emergency
14 feedwater system.

15 If that equipment was found to be not
16 environmentally qualified, would that change your decision
17 as to whether or not Three Mile Island should be allowed to
18 restart?

19 A (WITNESS WERMIEL) In my view it would not because
20 equipment environmental qualification, again, is not a
21 significant contributor to overall system reliability. The
22 particular environment we are talking about has to do with
23 the steam line break environment, and the steam line break
24 is a relatively low probability event.

25 Q Is it low enough a probability event that it would

1 be acceptable if the entire emergency feedwater system
2 failed as a result of the environmental consequences?

3 A (WITNESS WERMIEL) No, it is not. Eventually the
4 environmental qualification would have to be assured. But
5 again, on an interim basis that is a low probability
6 occurrence and does not impact my feelings on the overall
7 reliability of the system.

8 Q Mr. Wermiel, could you just give me any example of
9 some defect in the emergency feedwater system that would
10 affect your assessment of its reliability?

11 A (WITNESS WERMIEL) Yes. I would say that if we
12 found that something within the system that was looked at
13 did not meet the single failure criterion, then I believe
14 the reliability would be impacted and would be affected to
15 the point where we would have to look at that particular
16 failure and see what its consequences are and what its
17 effects on reliability are.

18 Q Well, when you made the changes to your testimony
19 yesterday on page 25, you said that the single-failure
20 criterion would not be met prior to restart.

21 A (WITNESS WERMIEL) That has to do with the
22 automatic initiation system again not meeting the
23 single-failure criterion.

24 Q But that did not affect your assessment of whether
25 or not the system was safe enough to restart.

1 A (WITNESS WERMIEL) We looked at the effect of that
2 single failure, and as I said before, we decided for an
3 interim time period that the defense-in-depth provisions of
4 feed and bleed and operator recovery from the single failure
5 were sufficient to assure a reliable enough system on an
6 interim period for restart.

7 (Counsel for UCS conferring.)

8 Q Is that the only way in which the single-failure
9 criterion will not be met at the time of restart?

10 A (WITNESS WERMIEL) I believe there is another that
11 I mentioned when I was here before that had to do with the
12 steam line break. In the event of a steam line break in one
13 steam generator and a single failure in the flow control
14 valve to the intact steam generator, you may not
15 automatically deliver emergency feedwater. And again, that
16 does not impact on my relative assessment of the reliability
17 of a system because the steam line break is a low
18 probability occurrence.

19 This single failure point will also be corrected
20 by this proposed long-term upgrade that we have already
21 mentioned. The automatic initiation upgrade includes
22 redundant valves.

23 (Pause.)

24 Q In making your judgment as to whether or not the
25 emergency feedwater system for Three Mile Island Unit 1 is

1 sufficiently reliable, do I understand you to say that you
2 will compensate for the lack of compliance with some
3 requirements by considering the probability of demand for
4 the system? Is that what you are saying when you say you
5 are not concerned about the steam line break or high energy
6 line break?

7 A (WITNESS WERMIEL) You are talking about the
8 probability of the initiating event?

9 Q Yes, sir.

10 A (WITNESS WERMIEL) That is part of it. And I
11 believe I have espoused or stated the rest of our
12 consideration.

13 Q Assume that if there were a high energy line break
14 and this resulted in a guaranteed failure of the total
15 emergency feedwater system, would you recommend restart? In
16 other words, assuming that a high energy line break occurred
17 and because of lack of environmental qualification of the
18 equipment in the emergency feedwater system, we knew that
19 the entire emergency feedwater system would fail, would you
20 recommend restart under those conditions?

21 A (WITNESS WERMIEL) I believe I would so long as I
22 assured myself that the probability of that occurrence was
23 as low as we expect it to be. In other words, there is not
24 some flaw in the steam line that has gone undetected or --

25 Q What probability do you assign to a high energy

1 line break?

2 A (WITNESS WERMIEL) I believe Mr. Curry knows that
3 better than I. I have heard numbers like 10⁻⁶, I believe.

4 Q That is not my question. My question is to you:
5 what probability would you consider acceptable for allowing
6 restart, the probability of a steam line break occurring
7 that you would consider acceptable as a basis for restart,
8 knowing that such a high energy line break would disable the
9 entire emergency feedwater system?

10 A (WITNESS WERMIEL) I believe it would have to be
11 on the order of 10⁻⁶ or something like that.

12 Q 10⁻⁶ per reactor year?

13 A (WITNESS WERMIEL) Yes.

14 CHAIRMAN SMITH: That is given as a certainty that
15 the break would --

16 MR. POLLARD: Would disable emergency feedwater.

17 WITNESS WERMIEL: I might also say that we do not
18 use the number per se as justification. We would have to,
19 again, assure ourselves that the feed and bleed backup is
20 available in this kind of event for decay heat removal.

21 BY MR. POLLARD: (Resuming)

22 Q As I understand your testimony, neither you nor
23 anyone on the staff has done so.

24 A (WITNESS WERMIEL) Pardon me? Has done --

25 Q Neither you nor anyone else on the staff has

1 determined that the feed and bleed mode is an adequate means
2 of removing decay heat.

3 A (WITNESS WERMIEL) I believe we have said that it
4 is an adequate means for removing decay heat for a certain
5 time period.

6 Q You have done some analysis of that?

7 A (WITNESS WERMIEL) No, we have no analysis of
8 that; but we do know its availability is there and that it
9 can do that, and I believe that is on the record.

10 Q And you have looked at that specifically for high
11 energy line break and steam line break, that you know that
12 feed and bleed will not be affected by lack of environmental
13 qualification of the equipment.

14 A (WITNESS WERMIEL) I do not know about the
15 environmental qualification of a high pressure injection
16 system.

17 (Counsel for UCS conferring.)

18 Q Do you know about the environmental qualification
19 of the other equipment used for bleed and feed other than
20 high pressure injection?

21 A (WITNESS WERMIEL) No, I do not.

22 (Pause.)

23 Q On the top of page 12 of your testimony you state
24 that the table, meaning the table attached to your
25 testimony, identifies each current emergency feedwater

1 system requirement when compliance with the requirement was
2 or will be implemented by the Licensee and the source of the
3 requirement and where a discussion of the evaluation against
4 the requirement can be found.

5 I would like you to refer to page 25 of your
6 testimony and tell me whether you believe that sentence I
7 just read is correct.

8 (Witness reviewing document.)

9 A (WITNESS WERMIEL) I am not sure I follow the
10 question.

11 Q Well, look, for example, at item -- pick an item:
12 item 10, 9, 8, 7.

13 A (WITNESS WERMIEL) Yes?

14 Q Can you tell me where the source of those
15 requirements are from on that table?

16 A (WITNESS WERMIEL) Yes. The source of these is
17 the standard review plan.

18 Q And can you tell me from that table where a
19 discussion the evaluation against that requirement can be
20 found for TMI Unit 1?

21 A (WITNESS WERMIEL) I guess I cannot. I have not
22 identified it here. The reason for that is because I
23 believe I put in "not applicable" in the Prior to Restart
24 column because the system designed had already met that
25 requirement or that item of criteria.

1 Q Well, of course, what I am interested in is on
2 what basis you entered "yes" in the Prior to the TMI-2
3 Accident column.

4 A (WITNESS WERMIEL) On the basis of an evaluation
5 of the system design.

6 Q And your evaluation is not written down in some
7 place where I could examine the discussion of how the
8 requirement is met; is that correct?

9 A (WITNESS WERMIEL) We do not necessarily in our
10 evaluation describe item for item, line for line, a
11 discussion of its evaluation -- its compliance against
12 evaluations. We review it and we review it as we feel -- to
13 impart enough information to other parties that they
14 understand what it is we have done.

15 (Consel for UCS conferring.)

16 Q Perhaps you can help me find the item in the table
17 dealing with environmental qualification of emergency
18 feedwater.

19 A (WITNESS WERMIEL) On page 24, item 2.

20 Q Thank you. In that entry on that page you had a
21 "yes" under the Prior to the TMI-2 Accident, that the
22 equipment was protected against the effects of high and
23 moderate energy pipe breaks.

24 A (WITNESS WERMIEL) Yes.

25 Q But if I understand your comments over to the

1 right and the staff's recent safety evaluation report on
2 environmental qualification, apparently there is some doubt
3 as to whether or not the system had been protected against
4 those effects when the plant was originally licensed or even
5 prior to the TMI-2 accident.

6 A (WITNESS WERMIEL) Yes, that is true.

7 Q Can you tell me, then, why I should have a great
8 deal of confidence for the yesses you have entered for items
9 7, 8, 9 and 10, for example, on page 25?

10 (Pause.)

11 A (WITNESS WERMIEL) Only in that I rereviewed the
12 information available and found no deviation from it for
13 those items. If something new had been discovered somewhere
14 along the line, then there might not be indicated compliance
15 with that item such as is indicated for environmental
16 qualification.

17 (Counsel for UCS conferring.)

18 Q At the time the Three Mile Island Unit 1 was
19 licensed, it was not reviewed against the requirements in
20 the Standard Review Plan, is that correct?

21 A (WITNESS WERMIEL) The requirements in the
22 Standard Review Plan were not identified, as I say, item for
23 item, line for line. The review was, in my understanding,
24 essentially in the same fashion that we now use the SRP. I
25 do not know the specifics of the original review and I do

1 not know precisely what is documented for that original
2 review.

3 But the SRP is not something -- when it was
4 written it was not something that was entirely new. It was
5 meant to identify how the staff does its review and what we
6 look for and what we have looked for.

7 Q Okay. Referring to item 4 on page 25 of your
8 testimony where you say failure of non-essential components
9 does not affect the emergency feedwater system, reference
10 Regulatory Guide 1.29, you say that this was met prior to
11 the TMI-2 accident.

12 Has the staff done a systems interaction study for
13 Three Mile Island Unit 1?

14 A (WITNESS WERMIEL) I am not aware of one.

15 Q Well, what review did you do in order to enter
16 this "yes" under Prior to the TMI-2 Accident?

17 A (WITNESS WERMIEL) I examined to the best of my
18 capability the location of the system with respect to
19 nonseismic structures and nonseismic piping systems and how
20 they may impact the operability of the system.

21 Q Are you familiar with the recommendations the ACRS
22 made on this subject for Three Mile Island Unit 1 in
23 December of 1980?

24 A (WITNESS WERMIEL) No, I am not.

25 (Counsel for UCS conferring.)

1 (Counsel distributing document to Board and
2 parties.)

3 (Witness reviewing document.)

4 MS. WEISS: I wonder if I might inquire through
5 the Board if it is necessary to mark this as an exhibit or
6 whether the staff intends to put this ACRS letter in along
7 with the SER supplement on closing the open items.

8 MR. CUTCHIN: Mr. Chairman, I have to say I
9 honestly do not know, but it was my understanding that the
10 staff intended somehow to address ACRS concerns; but I
11 cannot guarantee that those concerns will be addressed in
12 Supplement 1.

13 DR. JORDAN: There has been a promise from the
14 staff to address these items, but there is also, I believe
15 -- was this not entered into the record by Ms. Bradford?
16 She brought it up, I know.

17 MR. CUTCHIN: I do not know, sir.

18 (Board conferring.)

19 MR. WEISS: Well, if it has not already been
20 admitted, then we would want to mark it for identification
21 at this point as a UCS exhibit, but I just do not know.

22 (Board conferring.)

23 CHAIRMAN SMITH: The suggestion was made that this
24 was produced into the record by Ms. Bradford for the
25 additional comments of Moeller and Okrent, and it was not.

1 It was given to us as a basis for a contention, underlying
2 basis, but it never made its way into the evidentiary record.

3 MS. WEISS: In that case, we would like to mark it
4 as a UCS exhibit for identification, and I have no idea what
5 number we are up to.

6 CHAIRMAN SMITH: 32.

7 MS. WEISS: Thank you.

8 (The document referred to was
9 marked UCS Exhibit No. 32
10 for identification.)

11 MR. BAXTER: Mr. Chairman, I do think that the
12 copy that is provided to the reporter for the official
13 record should not be the one that is marked up as has been
14 the one that we have been distributed.

15 CHAIRMAN SMITH: I do not see any bias in the
16 marking.

17 MR. BAXTER: I can.

18 MS. WEISS: I can mark the other two paragraphs
19 that are not, and then they will all be marked.

20 CHAIRMAN SMITH: I agree. If we have two copies
21 before us, one marked and one not marked, we would take the
22 unmarked one, but do you see any prejudice in the marking?

23 MR. BAXTER: I would be glad to provide you with
24 an unmarked one. Yes, I do.

25 CHAIRMAN SMITH: Okay.

1 BY MR. POLLARD: (Resuming)

2 Q You are, of course, free to read the whole
3 letter. I am particularly interested in directing your
4 attention to item 1 on page 2 of UCS Exhibit 32 where the
5 ACRS recommends again that the Licensee should conduct
6 reliability assessments of the plant as modified and that
7 the ACRS, as you can see, is concerned when they state that
8 we believe the Licensee should examine the plant from the
9 standpoint of systems interaction that may degrade safety.

10 Now, the ACRS also went on to say that in their
11 view, completion of these systems interactions should not be
12 a condition for restart. After seeing this letter -- is
13 this the first time you have heard of these requirements?

14 A (WITNESS WERMIEL) Yes, it is.

15 Q If there were systems interactions at TMI Unit 1
16 that could degrade the reliability of that system, would
17 that affect your evaluation or your recommendations
18 concerning restart?

19 A (WITNESS WERMIEL) I think it might, depending on
20 what the interaction is and what it would do to the
21 emergency feedwater system should that particular failure
22 occur.

23 Q Without doing a systems interaction study and then
24 not in a position to know whether there are such
25 interactions and a chance to evaluate their probability, on

1 what basis do you believe that restart should be permitted
2 without performing such a study?

3 A (WITNESS WERMIEL) We do a type of systems
4 interaction in our reviews, and I did in my review. I did
5 examine certain potential interactions and satisfied myself
6 that there were none and that none could compromise the
7 operability of the system.

8 Q How did you go about doing that evaluation? Did
9 you --

10 A (WITNESS WERMIEL) I examined the documentation
11 available in the restart report, and then I walked the
12 system down to examine its physical location and its
13 supporting systems and other items in the area of the system.

14 Q Did you examine for the types of interactions such
15 as could occur by rupture of a non-safety system in some
16 other part of the plant and, for example, backing up through
17 a drain system?

18 A (WITNESS WERMIEL) Yes, I did. I examined the
19 drains in the room and where they went, what other fluid
20 systems were in the vicinity that might impact the emergency
21 feedwater system, and I could find no problems from my
22 review.

23 Q Did you review the instrumentation circuits for
24 not only emergency feedwater but as well as all the
25 auxiliary supporting systems for emergency feedwater?

1 A (WITNESS WERMIEL) No, I did not.

2 Q Do you think that that could be a possible source
3 of systems interactions?

4 A (WITNESS WERMIEL) I believe we have reviewed
5 these circuit -- not I, but others have -- and have
6 identified where there may be interactions, and we are
7 pursuing corrective action in these areas.

8 Q You mean you found some systems interactions that
9 have to be corrected?

10 A (WITNESS WERMIEL) Well, we have identified the
11 single failure in ICS problem and are pursuing that one, for
12 instance.

13 Q Do you think what the staff has done already has
14 satisfied the recommendation that the ACRS has made here?

15 A (WITNESS WERMIEL) If I read this literally, I
16 honestly could not say. I do not know --

17 Q Have you --

18 A (WITNESS WERMIEL) Certainly the Licensee, as far
19 as I know, has not conducted reliability assessments of the
20 plant as modified. For instance, I do not know what the
21 Licensee has done from the standpoint of identifying systems
22 interactions.

23 Q I know you told me you had not seen this letter
24 before. Have you been following any of the reports of the
25 ACRS dealing with the methods that must be used to perform

1 systems interactions studies in their view?

2 A (WITNESS WERMIEL) No, I have not.

3 (Counsel for UCS conferring.)

4 MS. WEISS: Mr. Chairman, I would like to move UCS
5 No. 32 for identification into evidence.

6 MR. CUTCHIN: Objection.

7 CHAIRMAN SMITH: Mr. Cutchin.

8 MR. CUTCHIN: Until I get a clarification, Mr.
9 Chairman, I have no objection to its being introduced for
10 the purpose of indicating its existence, for whatever use
11 that is.

12 CHAIRMAN SMITH: The letter exists. Do you
13 believe that the letter accurately represents the view of
14 the ACRS?

15 MR. CUTCHIN: I have no way of knowing one way or
16 the other, Mr. Chairman.

17 CHAIRMAN SMITH: Well --

18 MR. CUTCHIN: Normally these letters are admitted
19 into evidence merely for the purpose of demonstrating
20 compliance with the statutory requirement that the ACRS had
21 indeed performed a review. In this instance there is no
22 such statutory requirement.

23 CHAIRMAN SMITH: Ms. Weiss.

24 MS. WEISS: I frankly do not know the answer to
25 the question of whether there is a statutory requirement in

1 this case or whether the Commission is requiring the ACRS to
2 perform this review. I suspect that they are, but I would
3 like it into evidence to show that this is a letter which
4 the ACRS has written, and I do not think there is the
5 slightest challenge, reasonable challenge, certainly, from
6 Mr. Cutchin's side of the table that this is a genuine copy
7 of a letter from the ACRS.

8 MR. CUTCHIN: Oh, no.

9 CHAIRMAN SMITH: He concedes that. He only
10 objects on the basis -- well, he would allow it in -- well,
11 I think there are three levels in which we could receive
12 this exhibit. One is that the letter has been written and
13 for no other purpose, and you do not object to that, or you
14 do object to that.

15 MR. CUTCHIN: I do not object to its being
16 admitted for the purpose of indicating that such a letter
17 exists.

18 CHAIRMAN SMITH: The next level would be that the
19 letter accurately reflects the views of the author, and of
20 course the highest level would be that the views of the
21 author have some evidentiary weight in this proceeding, and
22 you are not even arguing that last one.

23 MS. WEISS: No, but I think it is clearly an
24 official document of the Commission and I think that it is
25 subject to official notice. I would think that the burden

1 would fall, under those circumstances, on the staff if they
2 had any question about this reflecting the true opinion of
3 the ACRS as stated in there.

4 MR. CUTCHIN: I will even stipulate, Mr. Chairman,
5 that the letter purports to represent the collegial views of
6 the committee.

7 MS. WEISS: That is fine, then.

8 CHAIRMAN SMITH: Then you have no difference of
9 opinion. All right.

10 Mr. Baxter.

11 MR. BAXTER: I have no objection.

12 CHAIRMAN SMITH: Then UCS Exhibit 32 is received,
13 and Mr. Baxter, you will provide a clean copy. Thank you.

14 (The document referred to,
15 previously marked for identi-
16 fication as UCS Exhibit No.
17 32, was received in evidence.)

18 DR. JORDAN: I think perhaps UCS does know, but
19 just for the record, Mr. Rowsome will be here in response to
20 Board questions and this will be a topic which we will be
21 inquiring into. We have asked him what the IREP study is,
22 where it stands, how it will be applied to TMI-1, and he
23 will be coming shortly, I believe.

24 MR. CUTCHIN: Mr. Rowsome is sitting to my left,
25 Dr. Jordan.

1 DR. JORDAN: All right.

2 BY MR. POLLARD: (Resuming)

3 Q On page 12, Mr. Wermiel, of your testimony --

4 A (WITNESS WERMIEL) Pardon me?

5 Q Page 12, second paragraph, first sentence. Is
6 that a sentence you wrote or is that lifted from some other
7 document?

8 (Witness reviewing document.)

9 A (WITNESS WERMIEL) That is a sentence that I wrote.

10 Q Can you please give me your definition for the
11 words "availability" and "reliability"?

12 A (WITNESS WERMIEL) Availability is, I believe, the
13 -- at a point in time the emergency feedwater system would
14 be available to perform its design function. Reliability is
15 a reflection of the potential availability of the system
16 over a period of time. In other words, it is time dependent.

17 (Counsel for UCS conferring.)

18 Q What units or terminology would you use to express
19 a numerical availability as compared to a numerical
20 reliability?

21 A (WITNESS WERMIEL) I am not entirely sure. I do
22 not do reliability studies in my work and I am not heavily
23 involved in this type of thing. I know Jim Curry could
24 answer that question much better than I.

25 Q That is why I am asking you, because it is your

1 testimony. When you wrote this, is there some distinction
2 in your mind between availability and reliability other than
3 the time frame?

4 A (WITNESS WERMIEL) Yes, I believe there is a
5 distinction.

6 Q Can you tell me what that is, please?

7 A (WITNESS WERMIEL) There are certain ways in which
8 a system might be available at a particular point in time,
9 but because it is constantly being maintained or under -- is
10 down for various reasons, its reliability over a period of
11 time may not be what you would want it to be because it is
12 not available.

13 (Counsel for UCS conferring.)

14 Q Let's assume that --

15 CHAIRMAN SMITH: Well, it may have been that Mr.
16 Pollard did not want Mr. Wermiel to have any help, so you
17 want to be careful about that.

18 WITNESS WERMIEL: I am sorry.

19 CHAIRMAN SMITH: In the sense of the way he put
20 the question, he wanted your answer and not Mr. Curry's
21 answer.

22 WITNESS WERMIEL: I might say --

23 CHAIRMAN SMITH: However --

24 WITNESS WERMIEL: I did not mean to quantify it in
25 this statement here. I just meant to tie the two together

1 in that they both reflect on the capability of the system to
2 perform its function. That was all I meant from a
3 qualitative standpoint.

4 BY MR. POLLARD: (Resuming)

5 Q An example may help me to understand the
6 distinction you intended when you wrote your testimony.
7 Suppose a system, one train of the emergency feedwater
8 system has been taken out of service for the purpose of
9 performing a periodic test, and that to do so renders it
10 incapable of operating if there were an actual demand.

11 Would that affect its availability or reliability
12 or both?

13 A (WITNESS WERMIEL) I guess it would affect both
14 because now you have the potential for a failure more likely
15 causing the system to not perform its function, and
16 therefore it is perhaps not as readily available to do its
17 function because one train is down.

18 Q Can you give me an example of a problem in the
19 emergency feedwater system that would affect its
20 availability but not its reliability, and then conversely,
21 something wrong with the system that would affect its
22 reliability but not its availability?

23 A (WITNESS WERMIEL) I do not think I can. I think
24 they are both a relation or both are related to the overall
25 system's performance capability. I do not think there is any

1 distinction or I am not sure I meant any distinction when I
2 used the two words. Only in that they are not synonymous,
3 necessarily.

4 (Pause.)

5 Q I am sorry I am taking so long. You already
6 answered some of my questions when you summarized your
7 testimony.

8 Perhaps the easiest way to proceed is I am,
9 frankly, somewhat confused by your table entries, "yes"
10 versus "yes" with an asterisk, particularly when you have
11 entered a "yes" in the Prior to TMI-2 Accident column.
12 Perhaps if I gave you an example you can help explain my
13 confusion.

14 You indicated, as I recall, when we discussed the
15 condensate level storage tank instrumentation that this
16 requirement had been met prior to the accident but that some
17 upgrading was necessary. Am I correct that when you enter a
18 "yes" it may be that the subject matter of the requirement
19 was met but clearly at the time of the accident they did not
20 have redundant level instrumentation on each tank? They had
21 some --

22 A (WITNESS WERMIEL) It was redundant to a point.
23 It was not fully redundant. There was one on each tank. So
24 a failure of the instrument on one tank still leaves you the
25 other one. The problem with redundancy is in the power

1 supplies.

2 Q So as a general rule, if I saw a redundancy such
3 as occurs on page 20 for item II.E where we are talking
4 about the flow test for these two hours independent of all
5 AC power, when you say "yes" in the Prior to the Accident at
6 TMI-2 column, does that mean yes, they had done a flow test
7 for two hours independent of all AC power prior to the
8 accident?

9 A (WITNESS WERMIEL) No. What it means is that we
10 in our review had determined that the EFW system at TMI-1
11 prior to the accident could supply -- we are talking about
12 item E, right?

13 Q Yes, E.

14 A (WITNESS WERMIEL) Yes, could supply emergency
15 feedwater to the steam generator independent of all AC for a
16 two-hour time period.

17 Q And your subsequent review found out that the
18 earlier determination was incorrect.

19 A (WITNESS WERMIEL) Not really incorrect. There
20 was a defect in a portion of the design that needed to be
21 corrected to assure this capability in a more reliable
22 fashion. And that had to do with the safety valve setpoint,
23 I believe, on the steam supply line to the turbine and the
24 capability to operate the steam pressure control valve on
25 the steam inlet.

1 Q Isn't this the area where we had to add the backup
2 air supply for the valves?

3 A (WITNESS WERMIEL) Yes, it is.

4 Q Because the original air supply was not
5 independent of AC.

6 A (WITNESS WERMIEL) That is correct, and the valve
7 failed open as it should, but there was some concern that in
8 this fashion, should there be some fluctuation or
9 degradation of the steam supply, that the turbine might trip
10 on overspeed.

11 Q So that when you say a requirement in general was,
12 yes, it was met prior to the accident, but then in the
13 subsequent columns of prior to restart or post-restart where
14 we have a "yes" with an asterisk, it means the requirement
15 was perhaps partially met prior to the accident and that
16 some improvement or change in the plant is necessary to
17 fully meet the requirement.

18 A (WITNESS WERMIEL) Well, at the time the review
19 was done, it was felt that it fully met it, but subsequently
20 we got additional information from some source that might
21 have indicated that our original evaluation missed something.

22 Q With that explanation, can we turn to page 21 and
23 look at item I? Now, here you made a change to the written
24 testimony by deleting the asterisk from the "yes" in the
25 column Prior to Restart, so now the table reads, with

1 respect to the additional short-term recommendation
2 concerning the primary emergency feedwater, water source
3 level indication, you say yes, this was met prior to the
4 accident, yes it will be met prior to restart, but yes with
5 an asterisk with respect to post-restart.

6 Am I incorrect if I interpret that table as saying
7 what eventually the staff is going to require was not met
8 prior to the accident and will not be met prior to restart
9 and will only be met in the long-term post restart?

10 A (WITNESS WERMIEL) That is correct. The staff's
11 present requirements for this item will not be met until the
12 long-term post-restart.

13 Q Okay. On page 23, item II.2.

14 A (WITNESS WERMIEL) Pardon me, I missed the item
15 number.

16 Q I am sorry, II.B, design basis for emergency
17 feedwater system flow capacity.

18 A (WITNESS WERMIEL) Yes, sir.

19 Q In your comments you refer me to the restart SER.
20 On page C.1-3 of the SER, it says the plant will have to be
21 shut down in 48 hours, but your testimony on page 3 says it
22 has to be shut down in 72 hours. Is that an inconsistency
23 or am I misinterpreting those two sections?

24 A (WITNESS WERMIEL) No, that is a
25 misinterpretation. Our actual concern or our actual

1 criteria and requirement is for a 72-hour action statement
2 before shutdown. The Licensee has agreed to a more
3 conservative position of 48 hours, and that is documented in
4 their proposed tech specs.

5 (Counsel for UCS conferring.)

6 A I hope I have made myself clear. The 72 hours is
7 a requirement that we impose on all plants and is a little
8 more conservative for this plant only by Licensee's own
9 documentation.

10 Q Okay. While we are there on page C.1-3 of the
11 SER, it says, in the middle of the first paragraph, under
12 item 4, if a flow path is unavailable to both steam
13 generators or if capacity drops below 100 percent to both
14 steam generators, the reactor will be shut down within one
15 hour and placed in a cooling mode, which does not rely on
16 the steam generators, within an additional 12 hours.

17 Can you explain to me, please, how at Three Mile
18 Island Unit 1 the plant can be placed in a condition which
19 does not rely upon steam generators within 12 hours if both
20 flow paths to the steam generators are unavailable?

21 A (WITNESS WERMIEL) TMI-1 utilizes the main
22 feedwater for normal startups and shutdowns. Main feedwater
23 would be available.

24 Q All right. Let's assume that in taking the plant
25 off the line we lose offsite power as was required to be

1 considered in connection with General Design Criteria 17.
2 Can you meet the technical specification without offsite
3 power?

4 A Yes, you may for decay heat removal. You can rely
5 on the high pressure injection system in the feed and bleed
6 mode if all feedwater was not available.

7 Q And it is your testimony that relying upon bleed
8 and feed would place the plant in a condition that it would
9 not rely upon the steam generators.

10 A (WITNESS WERMIEL) That is right. The feed and
11 bleed mode does not utilize the steam generators for decay
12 heat removal.

13 Q What is the significance of the 12 hours, then?

14 A (WITNESS WERMIEL) This is written for a shutdown
15 utilizing the normal main feed system, and after 12 hours,
16 presumably, you would go to your decay heat removal system.
17 You would be at the cut-in temperature for decay heat
18 removal.

19 Q We cannot get the decay heat removal in 12 hours
20 using bleed and feed, can we?

21 A (WITNESS WERMIEL) I do not know whether you can
22 or not.

23 Q On page 24 of your testimony, item II.3, which
24 deals with seismic classification of emergency feedwater
25 system, the only entries you have in the table is yes, this

1 requirement was met prior to the accident, not applicable
2 prior to restart; but your comments is the Licensee has
3 performed the staff that some emergency feedwater system
4 valves may not be fully seismically qualified; this is being
5 reviewed by the staff.

6 Is it the staff's requirement that this matter be
7 resolved prior to restart or not?

8 A (WITNESS WERMIEL) I am not aware of the staff's
9 requirement in this area. It is not part of any of the
10 restart items that I am aware of.

11 Q Do you know whether or not the staff requirement,
12 whether it would ever be resolved even in the post restart?

13 A (WITNESS WERMIEL) It is my understanding that it
14 will be resolved at some time, yes. It is a staff
15 requirement that it at some time be resolved.

16 Q So then why on your table don't you have a "yes"
17 with an asterisk in the Post-Restart column?

18 A (WITNESS WERMIEL) Because it may be resolved
19 prior to restart. I just do not -- what I am trying to show
20 here is my evaluation, and I am not involved in this
21 particular reevaluation, and I just do not know what is
22 involved in it and I am not aware that it impacts the
23 restart requirements.

24 Q As far as your testimony goes, you do not know
25 whether or not the emergency feedwater system has to be

1 seismically qualified prior to restart.

2 A (WITNESS WERMIEL) I do not know that, that is
3 true.

4 Q Okay. On page 26, Item II.1.1, this deals with
5 adequate instrumentation and controls as it relates to
6 General Design Criteria 19, is that correct?

7 A (WITNESS WERMIEL) Yes.

8 Q And when you say that this requirement will be met
9 prior to restart, does that entry include your evaluation of
10 whether or not the requirement will be met if there is loss
11 of access to the main control room?

12 A (WITNESS WERMIEL) I am not aware of what is being
13 done to improve this area, considering a loss of access in
14 the control room.

15 (Counsel for UCS conferring.)

16 Q Are you aware of the provisions of General Design
17 Criterion 19 that address loss of access to the main control
18 room?

19 A (WITNESS WERMIEL) Not in detail, no.

20 Q Then what was your basis for the entry of the
21 "yes" if you do not know what the requirements of General
22 Design Criterion 19 are?

23 A (WITNESS WERMIEL) General Design Criterion 19, I
24 understand, goes well beyond merely its impact on emergency
25 feedwater and there are other reviews involved in that that

1 I am just not involved in.

2 Q I am only asking you about emergency feedwater.

3 Let me read to you the portion of General Design Criterion
4 19: Equipment at appropriate locations outside the control
5 room shall be provided, one, with a design capability for
6 prompt hot shutdown of the reactor, including necessary
7 instrumentation and controls to maintain the unit in a safe
8 condition during hot standby, and two, with a potential
9 capability for subsequent cold shutdown of the reactor
10 through the use of suitable procedures.

11 MR. CUTCHIN: Clarification, Mr. Chairman. I
12 believe Mr. Pollard inserted the words "hot standby," when I
13 read from my copy of the regulations, "hot shutdown." Was
14 there any intent for a different meaning?

15 CHAIRMAN SMITH: We were reading from the same
16 copy, I observe.

17 MR. POLLARD: I stand corrected. The actual words
18 are "hot shutdown."

19 BY MR. POLLARD: (Resuming)

20 Q Would you think that this requirement applies to
21 the emergency feedwater system?

22 A (WITNESS WERMIEL) Yes, it does, and I am aware
23 that they have control capability outside of the main
24 control room for emergency feedwater. Again, I am only
25 trying to identify the upgrade that was in my review area

1 that has been committed to.

2 Q So there might be some portion of General Design
3 Criterion 19 that is outside your review area that is not
4 met.

5 A (WITNESS WERMIEL) I do not know.

6 (Counsel for UCS conferring.)

7 A (WITNESS WERMIEL) I might add that I do not know
8 if the plant's compliance with GDC 19 is a restart
9 requirement.

10 Q Well, I am trying to interpret your testimony, Mr.
11 Wermiel. It is your testimony on page 26 where you are
12 referencing a requirement from the Action Plan that deals
13 with General Design Criterion 19. We have had previous
14 testimony in this proceeding about the nature of the
15 communications necessary between the control room and the
16 feedwater regulating valve area and between the control room
17 and some other area, which I have to admit escapes my memory
18 at the moment.

19 What I am trying to determine is whether in your
20 testimony when you entered the "yes," that you specifically
21 examined whether or not there is adequate instrumentation,
22 communication and controls to operate the emergency
23 feedwater system under the conditions of loss of access to
24 the main control room.

25 A (WITNESS WERMIEL) No, I did not.

1 CHAIRMAN SMITH: Let's break for lunch now. Is
2 that a logical breaking place?

3 MR. POLLARD: As you can see, it is. That was the
4 last question.

5 (Laughter.)

6 CHAIRMAN SMITH: All right. We will be back at 1
7 o'clock, at which time we will take a limited appearance
8 statement.

9 (Whereupon, at 11:55 a.m. the hearing was
10 recessed, to reconvene at 1:00 p.m. the same day.)

1 AFTERNOON SESSION

2 (1:03 p.m.)

3 CHAIRMAN SMITH: Is Mr. Manik present? Mr. Manik,
4 would you take one of the microphones, sir, and make sure it
5 is on.

6 MR. MANIK: Is this one all right?

7 CHAIRMAN SMITH: Yes, that one works. Make sure
8 it is on.

9 Mr. Manik, do you have a copy of your remarks, an
10 extra copy?

11 MR. MANIK: Not at the moment. I changed my
12 format from your other meeting, and when I got a call this
13 morning, I did not have anybody to type it over.

14 CHAIRMAN SMITH: Okay. Make sure that the
15 microphone is close to your mouth. Bring it as far forward
16 as you can.

17 LIMITED APPEARANCE STATEMENT OF ALBERT MANIK

18 MIDDLETOWN, PENNSYLVANIA

19 MR. MANIK: My name is Albert Manik. I live in
20 Middletown.

21 Members of this panel, I ask you to view General
22 Public Utilities' 1978 Annual Report. Can you see it
23 (indicating)? Can you see this report all right or do you
24 want me to move.

25 CHAIRMAN SMITH: Yes, sir, I can see it.

1 MR. MANIK: On the cover is a downriver shot. It
2 shows the hydroelectric plant and a view of Three Mile
3 Island. Now, you wonder what this has to do with the
4 restart of No. 1, so I will explain.

5 Certainly the caption on the bottom of this page
6 states that this hydroelectric plant has performed for a
7 period of 75 years of power, York Haven to Three Mile
8 Island, now 78 years old. Simply this is where the power is
9 coming from at present. It is the type of plant that Canada
10 has built and are performing at the present time.

11 We have rocks in our head to invite more and more
12 trouble with nuclear plants. We have a large abundance of
13 coal. We have excellent coal-fired plants located on this
14 river doing a great job with a minimum of problems to health
15 and safety of the people who live in the area. I know
16 because I lived in the area before I came to Middletown.
17 We simply cannot allow you to restart this glorified unit.

18 I spoke to this panel in Hershey when you heard
19 hearings. I asked you about the metallic taste people had
20 encountered. I told you that we did not know of our
21 problem. You promised to give me an answer. You took my
22 name and address, but I didn't get no answer. I am still
23 waiting. I never received an answer from anything I asked
24 of the NRC.

25 I feel that perhaps this government does not care

1 of its citizens, does not have to respond to their wants and
2 needs. Your group is a wonderful example of this type of
3 government. No more nuclear plants. We are going back to
4 what we have an abundance of. That is coal. Nuclear power
5 is expensive, dangerous, and that is why you are in town,
6 and not at all absolutely necessary.

7 What I would like to tell this panel to do is go
8 home and please read a copy of their fire insurance. If
9 your fire insurance policy states that you are insured for
10 nuclear accident, please tell me your fire insurance company
11 so I can get insured by the same company, though I doubt
12 your policy reads any different than ours.

13 I thank you.

14 CHAIRMAN SMITH: Thank you, Mr. Manik.

15 Mr. Manik, I recall your appearance at Hershey. I
16 remember your comment about the metallic taste, and I also
17 recall asking you to explain it a little bit. However, I do
18 not recall nor do I believe it is the case that I promised
19 you that I would report to you. But for your information,
20 other than that night at Hershey, Pennsylvania, I have never
21 again heard anything through all these witnesses about a
22 metallic taste.

23 MR. MANIK: You have not been reading the same
24 reports or newspapers I have, sir.

25 CHAIRMAN SMITH: Okay. Than you know more about

1 it than I do, sir. Thank you very much, sir.

2 MR. MANIK: If you are in doubt, and I cannot see
3 how you can hold hearings without GPU's stock reports, I am
4 certainly going to tell you to get copies of the 1978-1979
5 stock reports.

6 CHAIRMAN SMITH: Thank you, sir.

7 MR. MANIK: And I do not know how educated people
8 can hold such important hearings as you people are supposed
9 to do and not have copies of something. I am sure you have
10 something up there, or you should have.

11 CHAIRMAN SMITH: Yes, sir.

12 All right. What was worked out concerning Mr.
13 Rowsome's appearance.

14 MR. CUTCHIN: Mr. Chairman, I understand that UCS
15 has a great need to finish up with the witnesses on
16 feedwater in order that they also, UCS, may get back home
17 tonight. But to put it in perspective, Mr. Rowsome has
18 perhaps a five to ten-minute statement max to give the
19 Board, a briefing on the present status of the IREP work,
20 and then he does not have much more in the way of voluntary
21 information to give.

22 It would then depend on what questions the Board
23 may have. So I would presume we could get him on and off in
24 perhaps half an hour at the most. But I do not have a feel
25 for how many more questions UCS has and whether that would

1 jeopardize being able to complete with these two witnesses
2 or whether we might complete with them even if Mr. Rowsome
3 did not go on now.

4 CHAIRMAN SMITH: You have no questions of Mr.
5 Rowsome?

6 MS. WEISS: Quite frankly, Mr. Chairman, we
7 thought his testimony was given last week when we were not
8 here.

9 CHAIRMAN SMITH: That was one of the testimonies
10 that we understood from you that you would prefer if
11 possible to have put off until you could be here.

12 MS. WEISS: I did, but I did not realize that you
13 had agreed to that. I thought he had gone on last week.
14 But in any case, I have read the testimony and I would not
15 have any questions on the testimony as it stands, although,
16 depending on what he says, how he responds to questions of
17 the Board, questions may develop. But we would not have
18 anything, I think, in particular on this.

19 CHAIRMAN SMITH: I think it is worthwhile to try
20 to accommodate Mr. Rowsome.

21 MS. WEISS: I do, too.

22 CHAIRMAN SMITH: I understand his problem and I
23 think we should do it.

24 (Board conferring.)

25 CHAIRMAN SMITH: All right. Then if you don't

1 mind, let's take Mr. Rowsome.

2 MS. WEISS: I just wanted to say that we did not
3 disagree. What we had suggested was that we go to the first
4 afternoon break and then see where we were, but if it is a
5 matter of half an hour, I have no objection.

6 CHAIRMAN SMITH: We have discussed it and we do
7 not think it will be as long as that, if it is that long, I
8 mean as far as the Board's questions are concerned, and that
9 is probably the controlling consideration.

10 MR. CUTCHIN: We appreciate the Board's and the
11 parties' indulgence.

12 Mr. Chairman, I would ask, does the Board wish to
13 have the testimony that was viewed as not very helpful
14 included in the record, or would we just start with asking
15 him one direct question on having him update the status? I
16 really do not care; whichever the Board prefers.

17 CHAIRMAN SMITH: I think we should put the
18 professional qualifications in.

19 MR. CUTCHIN: Fine.

20 CHAIRMAN SMITH: Let's see.

21 MR. CUTCHIN: We can do the whole thing.

22 CHAIRMAN SMITH: I think it is probably easier
23 just to put the testimony in as you presented it.

24 MR. CUTCHIN: Fine.

25 Whereupon,

1 FRANK H. ROWSOME,
2 called as a witness by counsel for the Nuclear Regulatory
3 Commission, having first been duly sworn by the Chairman,
4 was examined and testified as follows:

5 DIRECT EXAMINATION

6 BY MR. CUTCHIN:

7 Q Mr. Rowsome, did you prepare a document with the
8 caption of this proceeding entitled NRC Staff Testimony of
9 Frank H. Rowsome Relative to the Interim Reliability
10 Evaluation Plan (Board Question 3), consisting of three
11 pages?

12 A That is right.

13 Q Did you also prepare a statement of your
14 professional qualifications which is attached thereto?

15 A Yes, I did.

16 Q Are there any corrections to the testimony as
17 filed which you wish to make?

18 A No, no corrections, thank you.

19 Q Then the testimony is true and correct, to the
20 best of your knowledge and belief?

21 A Yes, that is right.

22 Q Do you adopt it as your written testimony of this
23 proceeding?

24 A Yes, I do.

25 MR. CUTCHIN: Mr. Chairman, I ask that the

1 documents just identified be received into evidence and
2 bound into the transcript as if read. I will provide a copy
3 to the reporter later.

4 CHAIRMAN SMITH: All right. If there are no
5 objections, the testimony will be received.

6 (The document referred to, NRC Staff Testimony of
7 Frank H. Rowsome Relative to the Interim Reliability
8 Evaluation Plan (Board Question 3), follows:)

Docket No. 50-289

NRC STAFF TESTIMONY OF FRANK H. ROWSOME
RELATIVE TO THE INTERIM RELIABILITY EVALUATION PLAN
(BOARD QUESTION #3)

Q.1 Please state your name and your position with NRC.

A. My name is Frank H. Rowsome. I am an employee of the Nuclear Regulatory Commission assigned to the Division of Systems and Reliability Research. I have been a member of this Division or its antecedent Probabilistic Analysis Staff since July 2, 1979.

Q.2 Have you prepared a statement of professional qualifications?

A. Yes. A copy of this statement is attached to this testimony.

Q.3 Please state the nature of the responsibilities that you have had with respect to Three Mile Island, Units 1 and 2.

A. None.

Q.4 What is the purpose of your testimony?

A. The purpose of my testimony is to provide a response to additional Board Question #3 which states:

(Tr. 2392) The results of the Interim Reliability Evaluation Plan (IREP), as applied to Crystal River Unit No. 3 (CR-3) was scheduled for completion in July 1980. (The Board wants to receive a copy of this report.)

- a. When will the IREP be applied to TMI-1?
- b. Does the IREP address the adequacy of the proposed actions for B&W plants?

Response: A draft report on the IREP study of CR-3 was submitted to the Office of Nuclear Regulatory Research (RES) in May 1980. Three reviews were made of the draft: one by RES project management, one by a Research Review Group composed of personnel from RES, NRR, and consultants, and one by the licensee/owner, Florida Power Corporation. These reviews identified a number of deficiencies in the draft report, some of which are significant. RES project management is currently negotiating with the contractors, Sandia and Science Applications, Inc., to define a workscope and schedule for the revision of the draft and its publication

as a NUREG-CR report. The authors of the draft are currently assigned to IREP studies of other plants. Completion is not expected until early calendar year 1981.

Question 3.a: "When will IREP be applied to TMI-1?"

Response: The Office of Nuclear Regulatory Research, which is conducting the current IREP studies, does not plan to include TMI-1 in IREP. The current IREP studies (the analysis of four other plants commenced September 15, 1980) are intended to serve as a proving ground for procedural guidelines that can be followed by licensees. The procedural guidelines should be ready for use by the end of calendar year 1981. In accord with NUREG-0660, it is expected that NRR will require such studies to be performed by owners and submitted to the NRC for review. We anticipate that many, if not all, operating plants will be asked to submit IREP-type studies. TMI-1 may be among these.

Question 3.b: "Does IREP address the adequacy of the proposed actions for Babcock and Wilcox (B&W) plants?"

Response: No.

PROFESSIONAL QUALIFICATIONS

Frank H. Rowsome

Position: Deputy Director, Division of Systems & Reliability
Research, Office of Nuclear Regulatory Research

Education: BA, Physics, Harvard College, 1962
Doctoral studies (no degree), theoretical physics,
Cornell University

Relevant Professional Experience: Nuclear engineering and system reliability engineering,
Bechtel Power Corporation, 6 years
Deputy Director, Division of Systems & Reliability
Research and its antecedent organization, the
Probabilistic Analysis Staff, July 2, 1979 to present

1 BY MR. CUTCHIN: (Resuming)

2 Q Mr. Rowsome, would you provide a brief statement
3 updating the status of the IREP work between the time you
4 filed your testimony and the present?

5 A Yes, I will be happy to do that. The study of the
6 Crystal River Plant, which we refer to as the Phase 1 of the
7 IREP program, remains in limbo. No work has been done on it
8 since the draft report was submitted in May and a peer
9 review or rather three peer reviews of that draft were
10 performed early last summer.

11 We did milk that draft for some safty
12 recommendations which were transmitted to NER on the
13 occasion of the resumption of power generation of the
14 Crystal River Unit in July, and which can be made available
15 to you all if you wish.

16 We also milked the draft report for the lessons we
17 could learn from it for how to do and how not to do IREP
18 studies and folded that into a document called the Procedure
19 and Schedule Guide for Subsequent IREP studies, and four
20 additional IREP studies were started last September, one of
21 which entails a B&W plant, Arkansas Nuclear 1, Unit 1.

22 Those studies are now about halfway done, halfway
23 through. Two of the four interim reports from the
24 contractor teams that are performing these studies have been
25 submitted but they have not gotten to the point of producing

1 actual answers in terms of a safety profile of the reactor.

2 Therefore, we have nothing further in writing we
3 can show you in the way of results other than perhaps to
4 send you a copy of the memorandum we transmitted to NRR last
5 July in the safety findings from the draft Crystal River
6 Report.

7 BOARD EXAMINATION

8 BY DR. JORDAN:

9 Q Why did you abandon the Crystal River study?

10 A In fact, we do intend to fix it up and publish it,
11 and we have negotiated with the contractor who performed the
12 study a scope of work and we are awaiting his assemblage of
13 the personnel necessary to do the work. We are giving him
14 the green light to go ahead with the rewrite and publication
15 of that report.

16 Q Is it the same contractor that did --

17 A Yes.

18 Q Who is that?

19 A SAI, Science Applications, Inc.

20 Q I know it. They have so many locations.

21 A The Bethesda office.

22 Q Bethesda office.

23 Do you feel that the report is inadequate as
24 performed up to the present, incomplete and therefore needs
25 a lot more work?

1 A Well, the principal deficiency is that it is
2 highly inscrutable. It is difficult to tell what was done
3 and what was not done, what was covered and what was not
4 covered in their probabilistic safety analysis.

5 Q This was SAI?

6 A That is correct. That is the draft report to
7 which you referred.

8 Q Is SAI the contractor for Oconee? Did you say
9 Oconee? That would be one of the other reports?

10 A SAI is one of several contractors at National
11 Laboratories that is participating in the Phase 2 study for
12 plants under IREP. There is another risk assessment which
13 we have recently published which has nothing to do with IREP
14 but is a follow-on to the reactor safety study, called the
15 Reactor Safety Study Methodology Applications Program, which
16 also entailed a risk assessment of four reactors. But this
17 is quite distinct from IREP. The Oconee study is one of
18 these.

19 Q I see. Will SAI do the Oconee study, or do you
20 know?

21 A The Oconee study has been published and it was
22 done by Sandia National Laboratories. They may have had an
23 individual contractor who may have worked for SAI or may
24 have not. I don't really remember off-hand. But the
25 principal work was done by Sandia National Laboratories and

1 Battelle Columbus Laboratories on the reactor safety study
2 methodology applications risk assessments.

3 Q Let's go back, then, to the SAI Crystal River
4 study. You said it was deficient. Would you explain a
5 little more why it was deficient and what will be done in
6 the Phase 2 study to correct the deficiencies?

7 A Well, there were deficiencies of reportage and
8 scrutability and there were also some technical
9 deficiencies. The most severe technical deficiency was the
10 failure to pull out those mechanisms, those accident
11 mechanisms which could both precipitate the initiating event
12 and at the same time degrade the reliability of a safety
13 system called upon to respond to that event.

14 The Crystal River study, as are most risk
15 assessments published today, has taken initiating events as
16 given and described by the historical actuarial data base
17 for the most part.

18 Q From past experience, LERs and so on?

19 A That is right, at least for transients. LOCAs, of
20 course, the frequency of LOCAs are inferred and not just
21 obtained from historical data. But the frequency of
22 transients was taken from historical data and they were
23 assumed to occur in a non-mechanistic fashion, and to pose
24 challenges to standby systems such as the emergency
25 feedwater system.

1 Q Do you remember how frequent they chose for loss
2 of main feedwater?

3 A That is a sensitive subject. The number we use in
4 the reactor safety study, and that has recently been
5 confirmed by LER studies, is three feedwater transients a
6 year, and that is a good industry average. On the other
7 hand, a feedwater transient is not necessarily a complete
8 interruption of main feedwater delivery, and complete
9 interruptions of main feedwater delivery are not necessarily
10 extended interruptions of the kind that would really hazard
11 the cooling of the core.

12 There is good evidence that there are a good
13 average of three feedwater transients a year in most light
14 water reactors. On the other hand, less than one in three
15 of these entails a total interruption of main feedwater flow.

16 Q Does that mean less than one in three entail a
17 challenge to the emergency feedwater system?

18 A Most of them entail a challenge to the emergency
19 feedwater system in the sense that they will kick in the
20 autostart, but very few of them entail a critical challenge,
21 if you will, of the emergency feedwater system in the sense
22 that main feedwater could not participate in saving the core
23 from melt.

24 Q So it is a little bit like challenges to the
25 reactor protection system.

1 A That is right. That is right.

2 Q Well now, you say that they failed to include --

3 A Let me say this.

4 Q -- transients which would --

5 A Let me cite a specific example. For example, the
6 accidents at Rancho Seco and the one that occurred at
7 Crystal River itself while the study was going on entailed
8 the failure of a non-nuclear instrument power supply. The
9 so-called NNI bus fault, which precipitated a loss of
10 feedwater and also compromised the autostart of the
11 emergency feedwater system, at least at Rancho Seco.

12 That kind of accident mechanism was outside the
13 scope of the Crystal River IREP study because they did not
14 attempt to develop a causal mechanism for why feedwater
15 trips might occur that could tease out the commonality
16 between the bus fault as an initiating event and the bus
17 fault as a way of compromising the reliability of the
18 emergency feedwater system.

19 We clearly do not want future risk assessments to
20 have that kind of a blind spot, and we have altered the
21 procedures to make sure that it does not.

22 Q Does it make an attempt to include common mode
23 failures?

24 A Yes.

25 Q Has there been any progress since -- what is it,

1 Chapter 4 of WASH-1400 that addresses common mode failures?

2 A Yes.

3 Q New and better techniques.

4 A There are several different ways of improving upon
5 the WASH-1400 approach to common cause failures. Some of
6 them have to do with developing better causal models for how
7 faults propagate from the root cause into system failures.

8 For example, progress has been made in modeling
9 seismically-induced failures in power plant equipment.
10 Progress has been made in modeling fires and floods by such
11 mechanisms. Developments for more general mathematical
12 models to deal with statistically correlated failures in
13 similar equipment due to common design, common manufacture,
14 common maintenance and so forth have been developed by our
15 methodology people.

16 In addition, of course, we also have a much larger
17 statistical data base of experience than we had when the
18 reactor safety study was done.

19 Q Yes. Of course, one of the problems with common
20 mode failures is if you could anticipate them, you could
21 protect against them.

22 Well, in your opinion, will this be a good
23 technique for investigating interactions between, say,
24 safety and nonsafety systems?

25 A Yes.

1 Q Will it be a good answer, therefore, to the ACRS,
2 their section -- I guess it was Section 1 -- that we read
3 this morning?

4 A Yes. The ACRS has been urging for the last year
5 or two in a number of different forums that NER begin to ask
6 licensees or applicants to do probabilistic safety analyses
7 along the lines of the Reactor Safety Study as a tool to
8 investigate just this kind of problem. It is certainly our
9 feeling in the Office of Research, and I believe it is
10 shared by Harold Denton and the majority in NRR, that this
11 would in fact be a good thing to do.

12 What is holding the process up is the development
13 of a standard methodology, a consensus that here is a
14 sensible way of doing a reasonable amount of work with
15 reasonable assumptions. And the IREP project has as one of
16 its principal goals the development and debugging and trial
17 use of standard procedures for these techniques to use
18 probabilities to deal with multiple failure accident
19 scenarios.

20 Q You said there was one other study going on. Was
21 it the Oconee study that you mentioned or was it Arkansas 1?

22 A We are in the process of publishing now some
23 completed or very nearly completed risk assessments under
24 the reactor safety study methodology applications program.
25 Oconee is one of these and has been published. Sequoyah is

1 another and is due to be published any day now. Two others
2 are in the pipeline and I expect them out within six months.

3 Within the Round Two, if you will, of the IREP
4 program there are four other plants that are being subjected
5 to the new kinds of risk assessment techniques which entail
6 some of the improvements on common mode failures, and
7 Arkansas Nuclear 1 is one of these.

8 Q What was that?

9 A Arkansas Nuclear 1 is one of that set of four, the
10 only B&W plant among that population. These I do not expect
11 to be published until late summer, early fall.

12 Q I guess I do not want to take a lot of time to go
13 into it, but can you tell me briefly what the difference is
14 between the reactor safety type studies and the IREP
15 studies, and which do you feel are the most powerful and are
16 most likely to uncover possible transient sequences that
17 might result in core damage?

18 A The principal difference between IREP and the
19 reactor safety study is that IREP is scaled down and
20 abbreviated in an attempt to make a manageable scope of
21 work. It does not include consequence analysis, it does not
22 include detailed computer-assisted analysis of the challenge
23 posed to containment systems by core melts. It is
24 principally a look at the avenues to core melt and the
25 likelihood of those.

1 Q That is IREP?

2 A That is IREP.

3 Q I see. I see.

4 A It does contain a couple of wrinkles that make
5 that look a little bit more incisive or insightful than the
6 reactor safety study procedures, in particular the inclusion
7 of a mechanistic analysis of initiating events.

8 Q Do both of them use the techniques of the
9 WASH-1400, namely, event tree/fault tree?

10 A That is right, they do.

11 Q Do you feel that a study performed by a licensee
12 can be made -- will produce possible new information that
13 will be valuable as contrasted to the studies that -- well,
14 the WASH-1400 study, for example, that was done by the staff
15 or the IREP studies that are being done by contractors under
16 the staff.

17 A The answer is yes. We discovered a lot of
18 evidence, I should say, accumulated in and after the
19 accident at Unit 2 at Three Mile Island tending to suggest
20 that the susceptibility of plants to core melt accident
21 sequences may vary significantly from plant to plant and
22 that a single risk assessment using one or two reference
23 reactors or even half a dozen of them may misrepresent other
24 reactors not so analyzed.

25 We believe having one done for each individual

1 plant is desirable. It will not be perfect in the sense
2 that we will not achieve completeness, we will not quantify
3 with great accuracy the risks from each of these plants, but
4 we will have a tool that will enable operator training, for
5 example, to be a little better focused on the real threats
6 than they might otherwise be.

7 Emergency planning may be a little bit more
8 accurately tuned on real scenarios than otherwise. It will
9 provide a frame of reference with which to assess the
10 severity of operating occurrences.

11 Q To what?

12 A Operating occurrences.

13 Q To suppress?

14 A Assess significance.

15 Q Assess.

16 A You can say in what accident sequence, if any,
17 would a particular fault that has actually occurred belong.
18 Does that fault suggest the presence of failure mechanisms
19 that were not in the model, in which case you can use that
20 experience to improve the model, or if it is in the model,
21 it gives you a frame of reference with which to evaluate its
22 severity.

23 It should be a very valuable contribution to
24 operational safety to have such a model in hand.

25 Q We have had during the day while you were here, of

1 course, testimony which we will explore later this afternoon
2 about probability analysis that was done in the case of
3 TMI-1. Now, in that case there was a licensee analysis, and
4 we are also going to hear from Mr. Curry this afternoon
5 about the staff study.

6 Is that analysis that was done by Met Ed for the
7 limited case of the emergency feedwater system typical of
8 the IREP studies that would be done by a licensee for the
9 complete plant, or will the IREP study be more intensive,
10 have greater depth, or will it just be broader?

11 A It would be principally broader. It would be more
12 intensive or of greater depth in the sense that it would
13 include, because of its breadth, the fault tree analysis of
14 all of the support systems of the emergency feedwater
15 system; and an IREP study would be capable de novo of
16 identifying common cause vulnerabilities that might link the
17 initiating event with the emergency feedwater failure
18 through these support systems, which a one-system
19 reliability analysis could not do.

20 However, the studies of each of the individual
21 systems comprising an IREP study would not be appreciably
22 more intensive than a study of the emergency feedwater
23 system was in this instance.

24 Q There have been recommendations made in this case
25 that the integrated control system can indeed be a source of

1 common mode failures and that what is needed, and I think
2 the ACBS has pointed this out, is a system interaction
3 study. Did the Crystal River study produce or give any
4 further insight into the possible interactions between the
5 integrated control system and the overall system that has
6 not been out by the failure modes and effects analysis of
7 the ICS?

8 A. Well, the study itself did not, in fact. That is
9 one of the deficiencies in the study, that it did not track
10 down that kind of failure mechanism. On the other hand, the
11 experience of that reactor and at Rancho Seco has made is in
12 Research intensely aware of the potential role of the
13 control system buses, the NNI buses, as being a weak spot.

14 Q All right, then. I guess that is essentially what
15 I am leading to last. Now, as a result of the studies that
16 you have so far, are there any lessons that we should be
17 aware of? Has anything new turned up that would indicate
18 further either modifications in the hardware or the training
19 that has not been identified, say, in the Lessons Learned
20 Task Force or some of the other task forces or, well --

21 A Some of our results did get fed into the
22 NUREG-0667, the NUREG report on the transient stability of
23 B&W plants. Now, we do not have any new recommendations,
24 new discoveries of vulnerability beyond those which I
25 believe are part of the record in one place or another. I

1 can summarize them very quickly.

2 We found three potential common mode linkages that
3 could constrain the reliability with which a plant can deal
4 with a loss of feedwater. One of them is the station
5 blackout scenario in which AC power is the system that
6 fails, and the recommended --

7 Q That is offsite AC?

8 A Offsite and onsite. This is the subject of ALAB
9 603.

10 Q Yes.

11 A And our position is essentially that of the 603
12 board, to-wit: that the plant should have one train of the
13 emergency feedwater system capable of starting and running
14 without AC power, and that the operator should be trained
15 for it.

16 MR. BAXTER: What plant are you speaking of, Mr.
17 Rowsome?

18 THE WITNESS: ALAB 603 referred to St. Lucie 2.

19 The second has already been mentioned. It is the
20 NNI buses. One would like to see a design in which the
21 autostart of the emergency feedwater system cannot be
22 defeated by the loss of an NNI bus.

23 And third, another potential common mode lies in
24 the automatic system intended to deal with steamline break
25 accidents in B&W plants. Its function is to isolate main

1 and emergency feedwater to a depressurized steam generator,
2 presumably one depressurized by the main steamline or
3 feedline break.

4 In Crystal River during their incident, both steam
5 generators were isolated by this system. Even though they
6 did not have a steamline break, they simply had an
7 overcooling transient which allowed the pressure to decay in
8 the two steam generators to the point that both steam
9 generators satisfied the logic for steamline break and thus
10 the heat sink was shut off. As it happened, it did not
11 matter in that case because they were cooling with ECCS.

12 But we would prefer to see a design in which there
13 is an interlock so that both steam generators cannot be
14 isolated by an indication of low pressure in the steam
15 generators.

16 Q Do you know whether that has been adequately taken
17 care of in TMI-1?

18 A TMI-1 is in compliance with respect to the loss of
19 offsite power design, and I believe there are plans afoot to
20 address both the other concerns by the first refueling
21 outage after restart.

22 Q I see. I am quite familiar -- we had a fair amount
23 of testimony this morning on the automatic start and control
24 of the emergency feedwater system, but I think we have not
25 addressed very thoroughly yet today anyhow -- and my memory

1 is a little unclear as to where we stand with respect to the
2 steamline break.

3 But I take it you believe that that is one of the
4 long-term items.

5 A That is my understanding, but I am not an
6 authority on this plant.

7 Q All right. We will ask Mr. Wermiel about that one
8 when he gets back.

9 Then is it the staff's plan to eventually require
10 an IREP by each licensee, and if so, how long will it be
11 before there will be one required for TMI-1?

12 A That decision will be made by NRR. My
13 understanding is that NRR has already committed in principle
14 to the idea that this should be done on most, if not all,
15 plants. They are awaiting our development -- by "our," I
16 mean the Office of Research -- our development of the
17 standard set of procedures and prescription of what
18 constitutes an adequate job for such studies.

19 We will be able to deliver that to them probably
20 by the end of 1982. They will then elect to schedule and
21 pick the plants that are to be asked to do such studies.

22

23

24

25

1 Q But so far as you know, the experience thus far
2 with the IREP has not turned up a failure mode that has not
3 really been thought about or has not been addressed in the
4 redesign of TMI-1?

5 A Not that would be applicable to TMI.

6 DR. JORDAN: All right. I guess that is all I
7 have.

8 CHAIRMAN SMITH: Ms. Weiss.

9 CROSS ON BOARD EXAMINATION

10 BY MS. WEISS:

11 Q Mr. Rowsome, if you were asked to do an analysis
12 of the reliability of the emergency feedwater system at
13 TMI-1 would you use the component and human error
14 reliability data you used in the reactor safety study?

15 A With a very few exceptions, yes.

16 Q What kind of exceptions?

17 A We know today, for example, that failure rates for
18 code safety valves instead of being the 10^{-5} per challenge
19 used in the reactor safety study is closer to 10^{-3} .

20 DR. JORDAN: Is that failure to open, by the way?

21 THE WITNESS: Yes, I believe so.

22 DR. JORDAN: All right.

23 THE WITNESS: I really do not have all the
24 exceptions in my head, but there are a minority that have
25 changed appreciably. For example, another one is

1 turbine-driven pumps. Failure rate on demand for
2 turbine-driven pumps is around 10 percent instead of the
3 10⁻³ that I believe was used in the reactor safety study.

4 BY MS. WEISS: (Resuming)

5 Q Ten percent instead of 10⁻³ ?

6 A Yes.

7 Q That is a fairly substantial change.

8 DR. JORDAN: We will have a chance to ask Mr.
9 Curry what number he used.

10 BY MS. WEISS: (Resuming)

11 Q Just one last question. I am curious about what
12 sort of overall uncertainty level you would assign to
13 figures -- well, to the figures which Mr. Curry has
14 developed concerning the probability of failure of emergency
15 feedwater on demand for TMI-1.

16 A Well, there are uncertainties and then there are
17 uncertainties. One can calculate an uncertainty based
18 entirely on the statistical uncertainties in the raw data
19 that goes into the mathematical model, and that certainly is
20 a contributor to the uncertainty of the answer.

21 There are biases or errors in the model itself or
22 completeness issues having to do with the structure of the
23 model which introduce uncertainties that cannot be
24 quantified.

25 Studies such as that done by Mr. Curry tend to

1 have a conservative bias in both modeling assumptions and in
2 the data used. On the other hand, there is no assurance
3 that they found everything. There is a completeness
4 problem. You can never prove to everybody's satisfaction
5 that there might be something that nobody has noticed yet.

6 So whether those two things balance out or not is
7 not obvious, but within what we know, to the best of our
8 ability the models are made to have if any bias, a
9 conservative bias, but that nagging concern about
10 completeness remains.

11 Q Well, can you put a number on your best number on
12 the uncertainty limits to these absolute probability figures
13 for emergency feedwater failure, your best professional
14 judgment?

15 A Well, this is judgment, and it falls in modeling
16 as well as statistics. If I were to discover tomorrow that
17 they were non-conservative by as much as a factor of 10 or
18 conservative by more than a factor of 100, I would be mildly
19 surprised but not very surprised. If you were to enlarge
20 that band by another factor of 10, I would be quite
21 surprised.

22 So in terms of my own sense of confidence in these
23 things I would not be astounded if they underestimated the
24 failure rate by 10, but I would be very surprised if they
25 underestimated it by 100. And I think there is a

1 conservative bias that I would be -- would not be at all
2 surprised to discover they were conservative by a factor of
3 10.

4 Q I am sure you must be familiar with some of the
5 comments that Dr. Okrent has been making lately in the ACRS.

6 A Yes, indeed.

7 Q Both formally and informally about the extent to
8 which one can show with any degree of certitude that the
9 probability of core melt is less than 1 in 10,000. Do you
10 have any comments on -- well, I guess basically I am asking
11 you do you have an opinion on his opinion? Would you agree
12 or disagree with him?

13 A I am not sure what remarks of his you are
14 referring to. I would need to be a little more specific
15 before I pass judgment on his --

16 Q That is fair. Are you familiar with the paper
17 that Dr. Okrent delivered in Stockholm last fall at the IAEA
18 conference?

19 A I may have seen it, but I do not remember it well
20 enough to comment on it.

21 (Counsel for UCS conferring.)

22 MS. WEISS: Thank you. That is all.

23 CHAIRMAN SMITH: Mr. Dornsife.

24 BY MR. DORNSIFE:

25 Q I just have one question. Could you verify

1 something? Are you testifying today that indeed
2 probabilistic type of risk studies have been used to
3 determine whether the Lessons Learned from the TMI accident
4 items are indeed either necessary or sufficient?

5 A No. That has not been done. We did a brief
6 review of the risk relevance of the recommendations of the
7 Tedesco Task Force. This is not Lessons Learned, but the
8 Tedesco Task Force that was constituted after the incident
9 at Crystal River. And they have been run through a filter
10 for risk effectiveness or risk relevance, although a rather
11 judgmental, quick pass under considerable pressure of time.
12 This has not been done for the TMI Lessons Learned.

13 Q Do you think a study such as that would be useful
14 to determine whether the changes are either necessary or
15 sufficient?

16 A I think it would be useful to gain perspective on
17 that, yes.

18 Q But just to that extent, not to see if you have
19 obviously missed something that is a glaring error or
20 something that really is not -- something you could have
21 added that would reduce the risk by a much larger factor
22 than some that you did indeed require.

23 A That might be the outcome of such a study.

24 Q Is there any intent on the staff to do that kind
25 of a study?

1 A Not specifically in the context of Lessons
2 Learned. It is being done in the context of the rulemaking
3 initiatives going forward. That kind of an analysis will be
4 part of the research foundations for the standard engineered
5 safety features rule and for the degraded core rule.

6 MR. DORNSIFE: Thank you.

7 CHAIRMAN SMITH: Mr. Baxter.

8 BY MR. BAXTER:

9 Q Mr. Rowsome, you testified that three per year was
10 an industrywide average for feedwater transients, and I
11 think I understood you to say that that would not
12 necessarily involve a loss of all main feedwater, but that
13 in many cases there was actuation of at least some part of
14 the emergency feedwater system, is that correct?

15 A That is right.

16 Q It is my understanding from the testimony in this
17 record that a TMI-1 emergency feedwater system is actuated
18 by a loss of both of the two main feedwater pumps or of the
19 reactor coolant pumps, whereas at CE and Westinghouse plants
20 emergency feedwater can also be initiated by low steam
21 generator level.

22 Is that your understanding?

23 A I know that it is common practice in Westinghouse
24 plants to initiate on low steam generator level. I am not
25 an authority on TMI.

1 Q So do you know if your comment that for many of
2 the feedwater transients industrywide that you referred to,
3 possibly involving at least actuation of part of the
4 emergency feedwater system, whether that applies to TMI-1?

5 A I cannot -- I should not speak to TMI-1, not
6 having studied that plant.

7 Q Okay.

8 A In many B&W plants that I have studied that would
9 be a correct statement, but I am not an authority on TMI-1.

10 (Counsel for the Licensee conferring.)

11 Q Unless the other B&W plants have emergency
12 feedwater systems which initiate on low level, how could
13 there be a partial actuation of the system?

14 A Most of them do actuate on low level.

15 MR. BAXTER: I see. I have no further questions.

16 CHAIRMAN SMITH: Mr. Cutchin.

17 MR. CUTCHIN: No redirect, Mr. Chairman.

18 (Board conferring.)

19 CHAIRMAN SMITH: All right. Thank you, Mr.
20 Rowsome. You are excused.

21 (The witness was excused.)

22 MR. CUTCHIN: Again, I appreciate the Boards' and
23 the parties' indulgence.

24 CHAIRMAN SMITH: I think we could probably use a
25 study of error bands and confidence levels in predicting the

1 length of testimony. We are simply never right.

2 MS. WEISS: I said five hours. I think we're
3 going to come pretty close to that when you subtract out Mr.
4 Rowsome.

5 (Laughter.)

6 Whereupon,

7 JAMES CURRY

8 AND

9 JARED WERMIEL

10 resumed the stand and were further examined and testified as
11 follows:

12 CHAIRMAN SMITH: Are you ready to proceed?

13 MR. ADLER: It depends on what the Board has in
14 mind for order. We are done for now of questioning Mr.
15 Wermiel. Do you want the other parties to question him
16 before we proceed to Mr. Curry, or --

17 CHAIRMAN SMITH: Take this into account. If you
18 proceed with Mr. Curry, then you can have greater assurance
19 that you complete your cross examination tonight, but then
20 you will take the risk of having questions by other parties
21 tomorrow.

22 MR. BAXTER: Mr. Chairman, my cross examination
23 does not divide cleanly between the two witnesses. I would
24 prefer we do the panel.

25 (Board connecting.)

1 CHAIRMAN SMITH: I think just go ahead. Then you.
2 will have your option at least.

3 MR. POLLARD: Before we proceed with Mr. Curry, I
4 would like Dr. Jordan, he had mentioned he wanted something
5 done first by Mr. Curry before we began.

6 DR. JORDAN: Yes, I did. I thought it would
7 actually save time.

8 MR. POLLARD: I agree with you. I think it will.
9 In fact, doing so will probably answer some of the questions
10 I was intending to ask. It would be a more orderly way to
11 do it.

12 DR. JORDAN: Very well.

13 You heard me I think this morning, Mr. Curry. I
14 would like for you to take us through a typical -- take us
15 through one of these diagrams, analyses. Explain how --
16 what do you do and particularly how you get figures in on
17 say errors, human errors, the standard figures for frequency
18 of turbine failures, for example, and how you come out with
19 the final numbers that you do now.

20 I do not have any advice for you, just exactly how
21 to do it, but I do have a blown up copy that was supplied
22 and has been very helpful, because I was having a very hard
23 time reading the smaller copies.

24 WITNESS CURRY: Why don't I just start from the
25 top, and if you have any questions just chime in.

1 DR. JORDAN: If you would do that.

2 WITNESS CURRY: Okay. All right. The methodology
3 used to analyze the reliability of the EFWS at TMI-1 was a
4 fault tree which is presented as Attachment 1 to my
5 testimony. The fault tree is basically a deductive type of
6 logic network where one postulates a top event and then
7 tries -- or a top failure and then tries to deduce from that
8 some events which would lead to the failure of concern. In
9 general, the level of detail of the fault tree which can be
10 drawn to many levels of detail is limited by the analyst's
11 information.

12 In this fault tree when my information was limited
13 I made a conservative assumption. All right. The top event
14 to this fault tree is inadequate flow to the steam
15 generator, which I defined as less than 460 GPM. That
16 number was picked as a limiting number based on testimony by
17 Jensen before as to what would we need to mitigate any
18 transient.

19 DR. JORDAN: Yes. We had a lot of testimony on
20 that number.

21 WITNESS CURRY: Okay. All right. Perhaps I
22 should go through the symbols a little bit first so you
23 understand what we are talking about.

24 The rectangles are indicative of events. The
25 first bullet type symbol you see near the top of the tree is

1 what is known as an and gate, and is indicative in the fault
2 tree logic of a multiplicity of events that must occur in
3 order to achieve the event the and gate is connected to.

4 The other bullet type symbol, the one with the
5 point at the top, is an or gate, and is a logic
6 representation which indicates that if any of the events
7 beneath the or gate occur, the event to which the or gate is
8 connected will occur.

9 The ovals that you see connected, possibly to
10 either an and gate or an or gate, are just key points or
11 just places in which the analyst can note key points or
12 assumptions that he made in his analysis.

13 The circles indicate basic events for which
14 component failure reliability data is available. The
15 diamonds indicate the limit of resolution for which data is
16 available for a given event. The difference between a
17 circle and a diamond might be or is that the diamond could
18 be further developed.

19 DR. JORDAN: Could be what?

20 WITNESS CURRY: Further developed if necessary.
21 However, a number may be available for the diamond, so it is
22 not necessary to go into further details to determine the
23 probability of occurrence of a diamond.

24 DR. JORDAN: And the little triangles?

25 WITNESS CURRY: The little triangles are transfer

1 points within the three. If a triangle is upright, such as
2 triangles 2, 7, and 9 on the right side of your tree, it
3 indicates a transfer from another point in the tree in which
4 the exact same events occur. If the triangle is upside
5 down, it indicates a parallellism in that while the same
6 event, exact same event is occurring, a parallel event would
7 be occurring. For instance, the failure of EFV-30A may be
8 developed, and rather than develop the failure rate of
9 EFV-30B, EFV-30B has parallel redundant components. It is
10 the exact same thing, but they are redundant components.

11 DR. JORDAN: For example, the number 8 you say no
12 flow to steam generator B. You mean there is a parallel.
13 It would be steam generator A?

14 WITNESS CURRY: That is right.

15 DR. JORDAN: I see.

16 WITNESS CURRY: That is right. Okay.

17 DR. JORDAN: Yes.

18 WITNESS CURRY: So the top event, as I said, was
19 inadequate flow to the steam generator, less than 460 GPM.
20 Well, that event will occur if there is no flow from the
21 turbine-driven pump train, and there is no flow from either
22 electric pump train.

23 DR. JORDAN: Okay.

24 WITNESS CURRY: Okay. Now we will proceed now
25 down the turbine-driven pump train path. Stay on the same

1 page for a while. We will go down the turbine-driven pump
2 train path, and then we will come back and go down the
3 electric pump train path.

4 DR. JORDAN: I think you do not need to go in
5 great detail through each path.

6 WITNESS CURRY: All right.

7 DR. JORDAN: Before too long we will need to know
8 how you get the numbers in.

9 WITNESS CURRY: Let me just summarize on the first
10 page. I think if the Board has a perspective on the first
11 page, the farther you go it gets much more detailed, so the
12 Board understands the first page.

13 DR. JORDAN: Yes, I think so.

14 WITNESS CURRY: Fault trees can be drawn many
15 ways. I chose to draw it this way so that I personally
16 could see what areas of the system contributed most to the
17 unavailability of the system. So if we were looking at the
18 event where we had no flow from the turbine-driven pump
19 train, that event would occur if we had failure of the
20 turbine pump itself, if we had failures related to the
21 suction, the water suction to the turbine pump, or if we had
22 failures on the discharge side of the turbine pump.

23 There is also a possibility that that train may be
24 out for test and maintenance which is added separately on
25 the left. Similarly, on the right side of the tree where we

1 had no flow from either electric pump train, it has been
2 stated earlier that either electric pump is capable of
3 supplying the required flow; so we have an and event, that
4 is, both electric pump train A must fail and electric pump
5 train B must fail in order to get no flow from either
6 electric pump train.

7 Similarly, they are broken down to pump failures
8 themselves, discharge failures, suction failures, and test
9 and maintenance failures.

10 In doing the fault tree if one were to proceed
11 into greater depth, one would note that support systems for
12 pumps, for instance, must be taken into account as a failure
13 mode and as well as human interactions with the system.

14 DR. JORDAN: Now, where does the failure of the
15 electric supply show?

16 WITNESS CURRY: Okay. This particular event, and
17 I did draw it on the tree to indicate that, this particular
18 -- well, let me say there were there initiating sequences
19 analyzed: the simple loss of main feedwater where all power
20 --

21 DR. JORDAN: Yes, I understand that. I had
22 forgotten that. Go ahead.

23 WITNESS CURRY: Okay. I guess that is a brief
24 overview. The tree would proceed down to the point where if
25 you were to look on a later page, if I could suggest, oh,

1 perhaps page 5, picked at random, it seems to be a fairly
2 simple example. And if one were to look at the triangle
3 labeled 5 --

4 DR. JORDAN: That takes you back to page 1, does
5 it?

6 WITNESS CURRY: That would feed back into table 1
7 or page 1. If you looked on page 1 there was a block or an
8 event entitled "No flow from the condensate storage tanks."

9 DR. JORDAN: Ah, yes. Now I am catching up.

10 WITNESS CURRY: Then on page 5 under event 5 we
11 develop that possibility, and that possibility would arise
12 if we had no flow from the condensate storage tank A and no
13 flow from the condensate storage tank B. And then the logic
14 proceeds to the point where we are examining methods or ways
15 in which we would get no flow from, for instance, condensate
16 storage tank A. And we see at the very base of the tree
17 failures which indicate the limit of resolution of our data.

18 The circles indicate a basic failure rate. The
19 triangles indicate failure rates again or failure events --
20 I am sorry -- again that could be further developed but
21 which either are not necessary to further develop or are
22 impossible to develop.

23 DR. JORDAN: I see, but the data now goes in at
24 the circles, is that what you were telling me?

25 WITNESS CURRY: That is essentially correct.

1 Either the circles or the diamonds.

2 DR. JORDAN: Or the diamonds.

3 WITNESS CURRY: Right, right.

4 DR. JORDAN: Oh, yes. I see.

5 WITNESS CURRY: And from there is propagated back
6 up through the tree going through the logic of the ands and
7 the or gates until a top event -- that is, inadequate flow
8 to the steam generator -- is calculated or is estimated.

9 Now, it should be pointed out that such a method
10 uses Boolean algebra, and one cannot rigorously or one
11 cannot blindly plow through the logic gates and expect to
12 get the correct answer at the top, because consideration
13 must be taken into account for the common mode failures that
14 we have talked about before.

15 DR. JORDAN: Yes. That is what I wanted to
16 explore at your leisure. Go ahead.

17 WITNESS CURRY: Go ahead. Do you want to talk
18 about the treatment of common mode failures now?

19 DR. JORDAN: Wherever it comes up. You go ahead.

20 WITNESS CURRY: Okay. Okay. Well, the key
21 points, additional key points that I want to mention about
22 this tree --

23 DR. JORDAN: This being the whole?

24 WITNESS CURRY: This is one tree, the tree that
25 estimates the probability of failure on demand.

1 DR. JORDAN: I see. That is six pages.

2 WITNESS CURRY: Yes, sir.

3 DR. JORDAN: All right.

4 WITNESS CURRY: Yes, sir. Is to keep in mind the
5 purpose of this tree, and that was to estimate the
6 probability of the EFWS system to fail to deliver flow
7 within a five-minute period.

8 DR. JORDAN: Per challenge?

9 WITNESS CURRY: Per demand. That is correct.
10 That is correct. So consequently when the tree is being
11 drawn little credit is given in the tree for such operator
12 recovery actions.

13 DR. JORDAN: Yes.

14 WITNESS CURRY: Which would certainly improve the
15 reliability as a general rule. The number that comes out
16 then is essentially a function of basic equipment failure
17 rates and the probability of the system being in the correct
18 configuration upon demand.

19 Now, common mode failures, the treatment of common
20 mode events is taken into account by finding the point in
21 the tree at which the commonality becomes apparent. So in
22 other words, if there were a common mode failure of the two
23 electric pumps, I would look on page 1 and find the block
24 that said no flow from either electric pump train and apply
25 the common mode at that point, because it adds in -- adding

1 in at that level of the tree has a greater effect on the
2 overall reliability number than individually adding those
3 failures in farther down on the tree.

4 Mathematically what it boils down to is if you
5 multiply two small numbers together even once you are liable
6 to wind up with a very small number later on. So common
7 mode -- if a common mode failure of redundant components has
8 been identified, it is a matter of simply adding that
9 probability to the overall failure rate of the system.

10 DR. JORDAN: Well, now, that particular one, of
11 course, sounds like maybe -- maybe I am wrong -- a fairly
12 easy case because you do have experience about how often you
13 have an electric power failure -- I guess that is the
14 obvious common mode failure in this case, is that right?

15 WITNESS CURRY: Clearly, if one were to postulate
16 the initiating event being loss of all AC, I need not draw a
17 fault tree to determine the probability of failure of the
18 electric pump train.

19 DR. JORDAN: All right. But suppose now we had a
20 loss of main feedwater. Isn't that in itself possibly going
21 to trigger an opening of the circuits on loss of load and
22 thereby possibly take down the whole grid, and do you take
23 that into account?

24 WITNESS CURRY: No. The transient events that
25 were analyzed here were a simple loss of main feedwater, a

1 loss of main feedwater with concurrent loss of all offsite
2 power, which sounds close to the transient that you are
3 talking about. I do not really care whether main feedwater
4 caused the loss of offsite power or not. I analyzed the
5 reliability given that I have no offsite power available,
6 and that the third transient was the loss of main feedwater
7 with the loss of all AC power.

8 DR. JORDAN: No. I guess I have seen your
9 numbers. Oh, yes, they were separated out for the three
10 different possibilities.

11 WITNESS CURRY: That is correct.

12 DR. JORDAN: And so therefore I would say is not
13 main feedwater -- well, and you have not actually then put
14 into the calculations the probability of loss of main
15 feedwater or the probability of loss of offsite power.

16 WITNESS CURRY: That is correct. The probability
17 that these initiating events have no bearing on the
18 probability of the system responding to them.

19 DR. JORDAN: All right.

20 WITNESS CURRY: The Staff decided they were
21 worthwhile events to analyze; therefore, we do so.

22 DR. JORDAN: All right. How do you take into
23 account possible common mode failure of both electric pump
24 trains without a loss of offsite power?

25 WITNESS CURRY: Well, I have to identify a common

1 mode failure of the electric pump trains.

2 DR. JORDAN: Failure of a breaker, say. There
3 must be -- aren't there a lot of ways of getting a common
4 mode failure?

5 WITNESS CURRY: There should not be a lot of ways
6 to get a common mode failure. It is design philosophy to
7 make the trains as separate as possible. That is not to say
8 that there are not any ways.

9 DR. JORDAN: All right. Did you include common
10 mode failure then for the two pump trains? Did you put in a
11 number for it, and if so, how did you get it?

12 WITNESS CURRY: I do not believe I found a common
13 mode failure for the two pump trains.

14 DR. JORDAN: All right.

15 WITNESS CURRY: I found a common mode failure of
16 the system but not explicitly the two electric trains
17 themselves.

18 DR. JORDAN: Okay. Well, then, you go ahead and
19 tell me where you found common mode failures and how you put
20 it in.

21 WITNESS CURRY: All right. The common mode or a
22 common mode failure that I found to contribute to the
23 unavailability of the system or that I had no evidence to
24 believe, I should say, did not contribute to the
25 unavailability of the system would be the miscalibration of

1 the level sensors on the condensate storage tanks.

2 If indeed the level sensors were miscalibrated,
3 and depending on the ways in which they are calibrated --

4 DR. JORDAN: Yes. The usual type of common mode
5 failure.

6 WITNESS CURRY: That is right. They could very
7 well have been calibrated by the same person or with the
8 same instrument and therefore both be incorrectly
9 calibrated. I assess that as a common mode failure of the
10 system.

11 DR. JORDAN: Okay. Where did that come in? How
12 did you put that in?

13 WITNESS CURRY: That is simply using the data base
14 that I had; that is simply added on to the suction failure
15 common mode --

16 DR. JORDAN: Is that part of the data base in your
17 table? Did I miss that one?

18 WITNESS CURRY: Yes. Let me get my testimony out
19 here.

20 DR. JORDAN: You are now going to Attachment 2?

21 WITNESS CURRY: Yes, Attachment 2. Okay. That
22 number is in here, and, okay, the number that I used for
23 that was the item that you see under Table 3-2, item number
24 III entitled "Human Acts and Errors."

25 And under that Roman numeral III, item A -- A.2,

1 now as you can see, this table has a number of values
2 associated with it. The heading of the table there, at
3 least three values for each of the acts listed in this
4 table, a point estimate value, a value of the likelihood of
5 that occurrence if, for instance, there was indication in
6 the control room, or a value for the likelihood of that
7 occurrence if only local walkaround and doublecheck
8 procedures were used, and a value of the occurrence if
9 neither the double walkaround or control room indication was
10 provided.

11 So if we read this table we would see that item A
12 has the "title valves mispositioned during test or
13 maintenance," for item A.1. And A.1.a and A.1.b is
14 "inadvertently leaves correct valve in wrong position."

15 DR. JORDAN: Okay. Now, then, let's see the
16 numbers that you have there and explain those.

17 WITNESS CURRY: Okay. And let me add one other
18 thing. Then the item that most concerns your question in
19 terms of common mode probabilities is item 2 under A which
20 is entitled "more than one valve is affected (coupled
21 error)."

22 Now, these human error rates were developed in
23 consultation with a number of experts in the human error
24 field and were provided to the Staff for its use in the
25 studies previously referenced in NUREG-0611 and NUREG-0635

1 which analyze the reliability of Westinghouse and CE
2 associated systems.

3 We use the same data base here for the reason that
4 we wanted a solid base of comparison between designs. There
5 may be some arguments on the validity of data, but using a
6 common data base does allow us some justification for
7 comparing designs.

8 DR. JORDAN: Yes. I understood your testimony in
9 that respect.

10 Now, then, about these numbers here, I do not
11 quite see that, however. Take the 1-A figure. You have got
12 a $1/20 \cdot 10^{-2}$ 1 over X. Explain those to me.

13 WITNESS CURRY: Well, that particular thing is not
14 applicable to this failure we are discussing.

15 DR. JORDAN: All right. Give me one that is.

16 WITNESS CURRY: The one that is applicable is the
17 one that I chose was more than valve is affected.

18 DR. JORDAN: All right.

19 WITNESS CURRY: Or more than one item is affected.

20 DR. JORDAN: Okay. The point value is NI times
21 10^{-4} . What is the NI?

22 WITNESS CURRY: The N is really an approximation
23 sign. I guess they could not find a little squiggle so they
24 used an N when they typed up the table.

25 DR. JORDAN: I see. It is N. One times 10^{-4} .

1 WITNESS CURRY: Let me take that a little
2 further. That would be true. However, I was under the
3 understanding that the level instrumentation was indicated
4 in the control room. Therefore, one can make the assumption
5 that it is less likely than 10^{-4} that the failure would go
6 unnoticed. So I actually referred you to the valve failure
7 rate, but the sensor miscalibration rate is exactly the
8 same, and that number is 1 times 10^{-3} . It is actually
9 listed under three in that table.

10 (Board conferring.)

11 DR. JORDAN: Dr. Little asks your squiggle meaning
12 "about or approximately." What do you mean approximately?
13 An order of magnitude or a factor of two?

14 WITNESS CURRY: Well, there are error bands
15 associated with these numbers, if you read just to the right
16 of the number, for instance.

17 DR. JORDAN: I see. So it is a factor of 20, is
18 that right?

19 WITNESS CURRY: In this case it would be a factor
20 of 10 on that particular number as I read the table.

21 DR. JORDAN: Oh, I see. I see. The 1 times
22 10^{-3} is the point value with valve position in the control
23 room. You say that is estimated a point value of 10^{-3}
24 with an error factor of 10.

25 WITNESS CURRY: That is right.

1 DR. JORDAN: All right. Okay. Now I understand.
2 Thank you.

3 WITNESS CURRY: So it was a matter of judgment
4 when assigning the error, a human error probability
5 associated with these numbers. The information I had on
6 hand was that the position of the valves was indicated in
7 the control room, so I chose that number; and had it not
8 been indicated in the control room, I would have had a
9 number based on whether it was doublechecked or not
10 doublechecked. But it is indicated in the control room.

11 DR. JORDAN: Now, do you have the numbers on the
12 tables that you used to get both of the figures that you
13 gave us yesterday for the design mid-1979 and also the other
14 two points?

15 WITNESS CURRY: All right. Okay. I can explain
16 all the numbers on the little chart I gave you yesterday.
17 Let me give you a little history.

18 When we were asked to present quantitative
19 estimates to the Board, the only information we had on hand
20 was a checking type analysis that we had done on the B&W
21 report submitted to the staff.

22 It was thought more valuable if we redid an
23 analysis to provide some information on what the system is
24 or would be.

25 DR. JORDAN: Yes.

1 WITNESS CURRY: So in light of that, the checking
2 type analysis is such and was performed to ascertain whether
3 the dominant failure modes of the system had been correctly
4 identified by B&W in their report, and to confirm the
5 relative reliability of these systems compared to others.
6 So it is probably a little less rigorous than that that was
7 redone by the Staff for the updated system.

8 DR. JORDAN: I see. But now then, the question I
9 had was somewhat simpler. The numbers that you have now in
10 this Table 3, are those the numbers for the final system as
11 it will finally be, or does Table 3 actually have all three
12 sets of numbers in?

13 WITNESS CURRY: Table 3, well, which is my
14 Attachment 2 that we are talking about --

15 DR. JORDAN: Yes.

16 WITNESS CURRY: Is the data base that was used
17 both by B&W for its original analysis and by myself for the
18 analysis of the proposed design.

19 DR. JORDAN: These are the numbers for the
20 proposed design. I am just asking.

21 WITNESS CURRY: Now we are talking about what I
22 gave out yesterday. Okay. Now, what I gave out yesterday
23 to show on the bar graph, the number that is indicated as 4,
24 approximately 4 times 10⁻⁴, is the design that will have
25 all of the completions that we have talked about included in

1 there. The number that is indicated as 8 times 10⁻³ was
2 the number based on the Staff's checking analysis of the
3 original B&W report. And the 3 times 10⁻³ is an
4 estimation of what the system will be at restart.

5 DR. JORDAN: Yes.

6 WITNESS CURRY: Based on my understanding of what
7 they will have in it.

8 DR. JORDAN: Okay. But the numbers you use, for
9 example, to get the 3 times 10⁻³ are not in this table.

10 WITNESS CURRY: The derivation of 3 times 10⁻³
11 came about after I had completed the analysis for the
12 completed system.

13 DR. JORDAN: Good, good. That is helpful. Thank
14 you.

15 Okay. I think -- did I interrupt you by the way?

16 WITNESS CURRY: No, sir.

17 DR. JORDAN: I kind of have a feeling that I
18 understand now. It probably will turn out that I was
19 entirely mistaken about something; but I think perhaps we
20 are at a place where you can go ahead, Mr. Pollard.

21 CROSS EXAMINATION - Resumed.

22 BY MR. POLLARD:

23 Q Just one question I have to continue the general
24 explanation. The data that are contained in Attachment 2 to
25 your testimony are the data which were inputted to the

1 circles and the diamonds, is that correct?

2 A (WITNESS CURRY) That is correct.

3 Q And then the data which appear on pages 35 and 37
4 of your testimony are what results when you propagate the
5 data through the fault tree.

6 (Pause.)

7 A (WITNESS CURRY) That is right.

8 Q Just to make it crystal clear then, the separate
9 sheet that you handed out as Attachment 3 to your testimony,
10 the 8×10^{-3} corresponds directly to the graph shown
11 on page 37, specifically the lefthand table labeled "Loss of
12 main feedwater," and there is a little triangle shown in the
13 first box between 10^{-2} and 10^{-3} , and that corresponds to
14 the 8×10^{-3} .

15 A (WITNESS CURRY) That is right.

16 Q And then if you were to hand out Attachment, let
17 me postulate, 4 and 5 for the other two transients, namely
18 loss of main feedwater coincident with loss of offsite power
19 and loss of main feedwater coincident with loss of all AC
20 power, you could have another graph like this for those two
21 other transients.

22 A (WITNESS CURRY) Certainly.

23 Q Thank you.

24 In your discussions with Dr. Jordan on the common
25 mode failure of the electric pumps, as I understood you you

1 said you did not identify any particular common mode failure
2 that would affect just the two electric pumps, was that
3 correct?

4 A (WITNESS CURRY) Yes. I did not recall any that
5 would single those two out.

6 Q So you attach no probability or a zero probability
7 to the case where there may be some design deficiency in the
8 two electric motor-driven pumps.

9 A (WITNESS CURRY) When doing these analyses I do
10 assume that the equipment is designed correctly to achieve
11 its function.

12 Q And that is why, for example, you would have no
13 input into this fault tree for a common mode failure
14 involving a design deficiency.

15 A (WITNESS CURRY) I did not catch the first part of
16 that.

17 Q Because you assume that the equipment is properly
18 designed, that is why there is no input into your fault tree
19 of a common mode failure that would stem from a design
20 deficiency.

21 A (WITNESS CURRY) That is right. If I had a way in
22 which I could assign a credible number for design
23 deficiencies of the pump and the probability of both pumps
24 being designed incorrectly, I could certainly add to that.

25 I do not have a way to do that, and my judgment is

1 that that is probably less of a failure probability than
2 others that do become apparent.

3 A (WITNESS WERMIEL) Could I add something to that?
4 I might point out that operating experience with the pumps
5 since they have been installed would tend to uncover such
6 possibilities, we would hope, and if they did occur we might
7 then correct them. And as far as I know, no such
8 occurrences have been discovered.

9 Q Mr. Wermiel, how many times have the emergency
10 feedwater pumps at Three Mile Island Unit 1 been called upon
11 to operate?

12 A (WITNESS WERMIEL) In surveillance testing they
13 have been called upon, oh, I would estimate at least 50
14 times.

15 Q And during the surveillance testing how long do
16 the pumps run?

17 A (WITNESS WERMIEL) I am not how long they are run.

18 Q How long would the pumps have to run during a real
19 accident?

20 A (WITNESS WERMIEL) That depends on the transient
21 we are talking about and what the circumstances are.

22 Q Without knowing how long the pumps run during
23 periodic tests and without knowing how long they would have
24 to run for some particular accident, what is your basis for
25 saying that there are no common mode design defects in the

1 Three Mile Island Unit 1 emergency feedwater pumps?

2 A (WITNESS WERMIEL) I did not say I knew there were
3 none. I am saying what has transpired so far has identified
4 none, and I have some feeling of confidence in saying that.

5 Q Without --

6 A (WITNESS WERMIEL) I also am aware that there will
7 be a 48-hour endurance test performed on these pumps which
8 hopefully will identify any other potential common type
9 problems with these pumps.

10 Q Do you feel confident of this without knowing how
11 the periodic tests are done, without knowing how long these
12 pumps run?

13 A (WITNESS WERMIEL) I do not know the length of
14 time the pump is run in a periodic test. That test requires
15 the pump reaches its design discharge pressure. I do not
16 know how long that takes.

17 Q You think one 48-hour endurance test is sufficient
18 to discover any potential design deficiencies in the pumps.

19 A (WITNESS WERMIEL) Again, I did not say that.

20 CHAIRMAN SMITH: Mr. Pollard, I do think that you
21 have twice now misconstrued his answer.

22 MR. POLLARD: That could very well be, because I
23 lost track of why he interrupted. I was asking Mr. Curry
24 why.

25 CHAIRMAN SMITH: His interruption is consistent

1 with tradition, consistent with the practice that we have
2 had throughout this hearing that if a witness believes that
3 he can add to the record, he should. If you do not want
4 that in your cross examination, you are free to ask for it,
5 but there have been times when you have been pleased to have
6 it.

7 BY MR. POLLARD: (Resuming)

8 Q Mr. Wermiel, I believe I was asking Mr. Curry why
9 he had no input on his fault tree for a common mode failure
10 of both electric pumps, and I believe he said he had no
11 basis for providing some reliable estimate of what that
12 common mode potential would be.

13 Now, can you clarify for me what your addition to
14 his answer was?

15 A (WITNESS CURRY) What I meant to say was we have a
16 feeling that such commonalities perhaps have been, the
17 possibility of them has been reduced by periodic
18 surveillance testing, and other type tests that will be
19 performed on these pumps, and take confidence in that this
20 testing may uncover something that we might have overlooked,
21 and since they have not up until this point, we feel that
22 this possibility has been reduced. That is all I was trying
23 to say.

24 Q You cannot quantify how much it has been reduced,
25 can you?

1 A (WITNESS WERMIEL) No, I cannot.

2 Q Has the periodic testing had the capability of
3 detecting common mode failures caused by the severe
4 environment that would result during a high energy line
5 break?

6 A (WITNESS WERMIEL) No, it does not simulate that.

7 Q So there are other potential common mode failures
8 that have not been thoroughly explored by the periodic
9 testing.

10 A (WITNESS WERMIEL) The periodic testing would not
11 explore that type of common mode, that is correct.

12 DR. JORDAN: I guess maybe I would just ask a
13 question here. Mr. Rowsome has stated that there have been
14 advances over the WASH-1400 study, namely Chapter 4 which
15 was devoted to common mode failure. And he feels that there
16 are ways now of doing a better job of estimating common mode
17 failure.

18 Are you familiar with what he was talking about,
19 and are we using it?

20 WITNESS CURRY: Well, I am not sure if there was a
21 particular methodology that Mr. Rowsome is talking about.
22 We certainly are better aware or more aware of those
23 possibilities and make every effort to take them into
24 account, but I am not aware of a specific methodology.

25 DR. JORDAN: There are, of course, a number of

1 types of common mode failure. I presume you do include
2 common mode failures due to errors of maintenance, is that
3 correct?

4 WITNESS CURRY: That is correct.

5 DR. JORDAN: So some types of common mode errors
6 at least you do include.

7 WITNESS CURRY: Oh, yes. We are aware of any
8 particular type of common mode failure. If we are aware of
9 it, we include it.

10 DR. JORDAN: Of course, those common mode failures
11 of design are the toughest of all.

12 WITNESS CURRY: Again, they are tough. The
13 question -- or it should be added again that my judgment is
14 that they probably do not contribute as much to the
15 unreliability of the system.

16 DR. JORDAN: I see. The ones that you have
17 included, they are the dominant ones.

18 WITNESS CURRY: Clearly.

19 DR. JORDAN: Right. Okay. Thank you.

20 Go ahead.

21 BY MS. WEISS:

22 Q I am just curious about this design deficiency
23 question. If it is a question of design deficiency, in two
24 pumps that are of the same design it would be -- the same
25 probability that both would fail as the one would fail,

1 isn't that correct, due to design deficiencies?

2 A (WITNESS CURRY) Once again, that is the nature of
3 common mode. If there were a shortcoming in the design one
4 could postulate that under similar operation many components
5 are just as likely to fail as one.

6 Q So isn't --

7 A (WITNESS CURRY) You know, I might add is part of
8 what is thought of in the deterministic licensing process in
9 that there is some review by the Staff about the design and
10 operation of systems and components of systems.

11 Q I guess the difficulty -- it seems to me that the
12 difficulty you have in finding a probability number for a
13 common mode failure due to a design deficiency is your
14 difficulty with assigning any number to the probability of a
15 design deficiency. It does not matter whether it is a
16 common mode failure or whether it is -- whether it causes
17 two pumps to fail or one pump to fail. The difficulty is
18 assigning a number to it, a design deficiency, isn't that
19 correct?

20 A (WITNESS CURRY) Sure, sure.

21 Q Do you do that at all throughout the --

22 A (WITNESS CURRY) Let me try to put a perspective
23 on it. We only -- the design deficiency contributed to a
24 pumps failure probability is only one means or one
25 contributor to a components failure probability. If we had

1 no idea what the probability of a pump or a valve or any
2 component failing was, we would go down to each of its
3 possibilities of failing and try to assess what their
4 probabilities of occurrence are.

5 We do, however, have data on pump reliabilities
6 and the way in which it fails is somewhat immaterial to the
7 performance of reliability analysis.

8 Q So you do not know -- you are using actual
9 historical data, and you do not know how much -- you cannot
10 segregate the causes for failures of pumps or valves whether
11 they are design deficiencies or --

12 A (WITNESS CURRY) Design deficiency, production
13 deficiency, materials. We do not have data that finely
14 defined.

15 BY MR. POLLARD: (Resuming)

16 Q Mr. Curry, before we get to the substance of your
17 testimony I would like to inquire a little bit about your
18 professional qualifications statements attached to your
19 testimony. Can you tell me, please, what you were doing
20 between 1970 and 1974?

21 A (WITNESS CURRY) I think there is a typo here. I
22 actually received my B.S. in '74, so I was in school between
23 '70 and '74.

24 Q Oh, so the last paragraph should say you received
25 your B.S. in 1974.

1 A (WITNESS CURRY) That is right.

2 Q And what about the period 1976 to 1978?

3 A (WITNESS CURRY) I was in graduate school.

4 Q In the first paragraph you list the
5 responsibilities you have had since you were assigned to the
6 Division of Systems and Reliability Research, and you list
7 those as having included the review and development of a
8 computer model for radioactive isotope migration analysis of
9 several feedwater system designs, management of the reactor
10 safety study methodology applications program, and
11 participation in the IREP program.

12 Can you break that down for me as to how much time
13 you spent on each one of those responsibilities?

14 A (WITNESS CURRY) Well, I would say about a year in
15 the radioactive isotope migration area, which was another
16 section within our division. The rest of the time the work
17 somewhat overlapped. There is no distinct time or discrete
18 interval for these other activities. They were performed
19 concurrently in other words.

20 (Counsel for UCS conferring.)

21

22

23

24

25

1 Q The year that you spent on the isotope migration
2 study, was that from March of '78 until about a year later?

3 A (WITNESS CURRY) That is about right.

4 Q And you think -- even though you were doing the
5 other three things somewhat concurrently, you cannot
6 allocate the amount of percent of your time that you spent
7 on each one?

8 A (WITNESS CURRY) Well, I am very overworked. So
9 it was more than, you know, it would not add up to 40 hours
10 a week. It really is a kind of concurrent type activity.
11 So --

12 BY MS. WEISS: (Resuming)

13 Q I would worry about your calculations if it adds
14 up to more than 100 percent.

15 A (WITNESS CURRY) You would worry about that?

16 Q I would worry about that.

17 A (WITNESS CURRY) Well, it might.

18 (Pause.)

19 BY MR. POLLARD: (Resuming)

20 Q Am I correct that the plants you were project
21 manager of were not B&W plants and they were both for
22 construction permit proceedings?

23 A (WITNESS CURRY) They were CP proceedings. Greene
24 County was a B&W plant, by my recollection.

25 Q It was?

1 A (WITNESS CURRY) Yes.

2 Q Has that been cancelled or indefinitely deferred?

3 A (WITNESS CURRY) One of the two. I am not sure
4 what its current status is.

5 Q And you clearly state the other one was
6 Westinghouse.

7 Are you familiar, fully familiar with the
8 criticisms of the reactor safety study contained in the risk
9 assessment review group's report, sometimes referred to as
10 the Lewis report?

11 A (WITNESS CURRY) Well, I am not sure of the
12 adjective "fully." I am somewhat familiar with it.

13 Q You are aware of some of the criticisms of the
14 data base used by the reactor safety study?

15 A (WITNESS CURRY) I am aware that there is some
16 question about the data base on general.

17 Q And the data base that is in attachment 2 to your
18 testimony, as I understood you to say, you took that from
19 NUREG-0611?

20 A (WITNESS CURRY) It is the same data base that was
21 used there. Many of the values were taken from WASH-1400,
22 as Mr. Rowsome said, with some modification.

23 Q Do you know whether the modifications were in
24 direct response to the criticisms or comments of the Lewis
25 committee?

1 A (WITNESS CURRY) I think the modifications were in
2 response to improved knowledge.

3 (Counsel for UCS conferring.)

4 Q On page 31 of your testimony you state: "The
5 testimony provides the staff estimate of the reliability of
6 the TMI-1 emergency feedwater system as it is depicted in
7 part one of this testimony."

8 And then on page 39 of your testimony you discuss
9 why the uncertainty bounds associated with various component
10 failure and human error rates were not propagated to the
11 analysis on the grounds that this was not necessary in order
12 to do a comparative reliability assessment.

13 If the goal was to determine reliability rather
14 than a comparative reliability, why do you feel it was not
15 necessary to propagate the errors through the analyses?

16 A (WITNESS CURRY) Well, the goal was originally, in
17 terms of these studies, to develop a comparative reliability
18 estimate of these designs. The means for doing such or the
19 basis for doing that was to develop a point estimate of the
20 systems reliability.

21 (Counsel for UCS conferring.)

22 Q Since you did not propagate the uncertainty bounds
23 through the analyses, is it correct then that we cannot rely
24 upon the actual probability figure that you reported for the
25 Three Mile Island Unit 1 emergency feedwater systems?

1 A (WITNESS CURRY) Well, as I said in the testimony,
2 the reliability, point estimate of the reliability that is
3 presented here, should be considered to have an uncertainty
4 bound associated with it, and the actual system reliability
5 to lie somewhere within that uncertainty bound.

6 The question was asked to provide the staff's
7 estimates of the system's reliability and this is it.

8 BY MS. WEISS: (Resuming)

9 Q Let me direct you -- I suppose you are now on page
10 39. The large paragraph right in the middle, the sentence
11 that starts with, "The uncertainty bounds." You say,
12 quote:

13 "The uncertainty bounds associated with the
14 various component failure and human error rates were not
15 estimated and propagated through the analyses. Such an
16 approach is cumbersome and unnecessary for the purpose of
17 the analysis: the assessment of the reliability of a given
18 auxiliary feedwater system compared to other designs and the
19 identification of major contributors to a given auxiliary
20 feedwater system unreliability, so that system upgrading can
21 be most effectively undertaken is desired."

22 Now, in light of that, your own statement of the
23 purpose of the analysis, to what extent can your
24 probability, your bottom line probability figures, be used
25 as indicators of the absolute probability of emergency

1 feedwater failure at TMI-1?

2 A (WITNESS CURRY) Well, again, I would go to the
3 heading of that paragraph, which says "The actual system
4 reliability must be considered to be within the range about
5 the point estimate presented here, due to uncertainties in
6 component failure and human error rates."

7 Q What is the range?

8 A (WITNESS CURRY) I would concur with Mr. Rowsome's
9 judgment that it would be within an order of magnitude
10 either way. I would also be surprised if it was any greater
11 outside of that order of magnitude.

12 Q The absolute probabilities, not the comparative
13 probabilities, would you expect that to be --

14 A (WITNESS CURRY) I would be surprised if the
15 absolute probabilities lie outside the order of magnitude
16 range about the point estimate presented here. I would also
17 concur that it may -- the reliability estimate presented
18 here may lean toward the conservative side.

19 Q I asked you these questions bearing in mind that
20 what I consider to be the major criticism of the risk
21 assessment review group report was the underestimates of
22 uncertainty and the conclusion of the review group report
23 that in their opinion the uncertainty bounds were so large
24 that absolute probability figures cannot be derived from
25 WASH-1400, but they are good for comparison purposes.

1 I thought that was the kind of clarification that
2 you were making in your testimony. But I gather you feel
3 more confident that you can attach a range of uncertainty to
4 your absolute probability figures than the Lewis group felt
5 toward WASH-1400?

6 A (WITNESS CURBY) Well, once again, I think -- the
7 first point I would like to make, I think what I have said
8 is not inconsistent with the quote that you just gave. I
9 think it is very consistent. Keep in mind, however, though,
10 that in discussing WASH-1400 once again we are talking about
11 sequences, not reliabilities of individual systems.

12 The more -- the greater your analysis, the more
13 sequences, systems, components and human interactions that
14 you have to take into account, the greater the uncertainty
15 estimates. So I would probably feel certainly more
16 comfortable with estimating a small system's -- a small
17 individual system's reliability than I would with the
18 probability of occurrence of major sequences.

19 The reason for that is to a large extent due to
20 the possibility of common mode failures and systems
21 interactions that can be overlooked.

22 Q You mentioned when you were back on Table III-2 --
23 I just want to pick it up before I forget it -- item a.3,
24 and I guess that is (b), a.3(b), "more than one sensor relay
25 affected."

1 You mentioned that you had thought that there was
2 indication in the control room, but I was not clear on
3 whether you found out that you had used an incorrect number
4 or there is not indication in the control room. You made
5 some qualification I did not follow. I need you to clarify
6 it.

7 A (WITNESS CURRY) Well, failure probabilities, the
8 probability of something being in a failed state, changes
9 with the operator's knowledge of the system. So if the item
10 in question is indicated in the control room, where there
11 are constantly personnel, it is less likely that, you know,
12 such a failure will occur than if it was in an isolated
13 portion of the plant and it is not constantly under
14 observation.

15 Q Didn't you say that you had thought that there was
16 a level instrument indicated in the control room which you
17 have since discovered has no such indication, or did I just
18 hear you incorrectly?

19 A (WITNESS CURRY) No.

20 Q You were just describing generally, you would give
21 more credit?

22 A (WITNESS CURRY) Yes.

23 Q Okay, thank you.

24 (Counsel for UCS conferring.)

25 BY MR. POLLARD: (Resuming)

1 Q On page 34 of your testimony, the last sentence in
2 the paragraph, it says: "For example, such assumptions were
3 often necessary when interaction of the operator with the
4 system had to be considered without the specific operational
5 procedures available for review."

6 A Am I correct in understanding that sentence of
7 your testimony that when you prepared your fault tree or
8 inputted data to the fault tree, you did not review the
9 specific operational procedures for Three Mile Island Unit
10 1?

11 A (WITNESS CURRY) Well, certainly if they were not
12 available I did not review them.

13 Q Were they available or weren't they available?

14 A (WITNESS CURRY) I did not have them available.

15 CHAIRMAN SMITH: I think that, as these next
16 series of questions -- they sound familiar to me. I think
17 you should try to give concrete answers. I mean, you did
18 not. No would have been adequate.

19 WITNESS CURRY: I apologize. I thought that was
20 as concrete as I could give.

21 CHAIRMAN SMITH: I beg your pardon?

22 WITNESS CURRY: I said I apologize. I thought I
23 was --

24 CHAIRMAN SMITH: I know. We are familiar with Mr.
25 Pollard's cross-examination. I am familiar with what his

1 objectives are. And if you just give -- if you listen to
2 the question and give him concrete answers, it will be quite
3 helpful.

4 (Pause.)

5 CHAIRMAN SMITH: There was nothing wrong with your
6 answer. I am not criticizing you for your answer at all.
7 But we have been through this many times and I know -- I
8 know what we are going to be going through now.

9 (Pause.)

10 BY MR. POLLARD: (Resuming)

11 Q I had skipped a more complex question. Let me
12 back up just a moment. If I could direct you first to the
13 bottom of page 32 of your testimony. Well -- well, this is
14 a rather lengthy question. So I will try to go slow and
15 frame it.

16 On page 32 you are discussing the three types of
17 transients that you have analyzed. And you wind up
18 concluding that the reliability of the emergency feedwater
19 system during these transients -- I think you were referring
20 to the latter two transients, loss of feedwater coincident
21 with loss of offsite power or simply -- oh, dear.

22 Let me abandon that approach and just ask you a
23 simple direct question: Why is the probability that you
24 report on page 35, is it, and 37 of your testimony -- can
25 you explain to me why the probability of failure of the

1 emergency feedwater systems at Three Mile Island Unit 1 are
2 unaffected by the loss of offsite power, that the
3 probability is identical for either a simple loss of main
4 feedwater or a loss of main feedwater coincident with loss
5 of offsite power?

6 A (WITNESS CURRY) They are not exactly identical,
7 but they are very close, because in the second category the
8 diesel generators were available to supply the required AC
9 power.

10 Q Yes, but I would -- if we have offsite power,
11 which is the first transient you analyzed, I would have
12 assumed that there would be some probability associated with
13 the diesel generator's failing to start.

14 A (WITNESS CURRY) Well, that is clearly true.
15 Again, three transients were analyzed. There was not an
16 attempt to derive one number for auxiliary feedwater system
17 reliability, because such an attempt would require some
18 estimation of the percentage of time that loss of main
19 feedwater transients occurred coincident with loss of
20 offsite power and loss of all AC.

21 What was done, however, was specifically to
22 analyze each of those occurrences and to determine the
23 reliability of this system once those initiated events had
24 been postulated.

25 The case that you are talking about is the third

1 case, where we did postulate loss of everything, loss of all
2 AC power.

3 Q Okay. Let me -- I do want to concentrate on the
4 first two cases first. What these graphs on pages 35 and 37
5 tell me is that both for the mid-1979 design as well as for
6 the proposed design after all requirements are met, that the
7 probability of failure of the TMI-1 emergency feedwater
8 systems in responding to a simple loss of main feedwater is
9 almost exactly the same as the probability of the emergency
10 feedwater system's failing to respond to a loss of main
11 feedwater coincident with loss of offsite power.

12 And I was -- the question is, based upon your
13 analysis of the reliability or probability of failure of the
14 Three Mile Island emergency feedwater systems, does this
15 mean that the dominant failure modes are unaffected by
16 whether or not we lose offsite power?

17 A (WITNESS CURRY) Well, there were some assumptions
18 that were used in this study that have been used in the
19 studies of other auxiliary feedwater systems. And for
20 purposes of performing these studies, one diesel generator
21 was assumed available with a probability of one; the other
22 diesel generator was assumed available with a probability of
23 ⁻²10 . And given that assumption, these results were
24 estimated.

25 Q Thank you. I thought that was the answer to the

1 question. Let me see if I understand.

2 When you were calculating the probability of
3 success or the probability of failure of the Three Mile
4 Island Unit 1 emergency feedwater systems for the event,
5 loss of offsite power, you simply assumed that at least one
6 diesel generator would always operate?

7 A (WITNESS CURRY) That is one way to put it, yes.

8 Q And you attached no probability or a zero
9 probability of failure of both diesel generators?

10 A (WITNESS CURRY) That is essentially true.

11 Q Okay. Now I have the question on the third case,
12 that being loss of main feedwater coincident with loss of AC
13 power. If I compare that case on page 35, which is the
14 proposed design which will be implemented some time after
15 restart, with the same case on page 37, which was the
16 mid-1979 design, I am tempted to reach the conclusion that
17 none of the modifications or additional requirements imposed
18 upon emergency feedwater systems have had any effect upon
19 the reliability of this system for this transient. Is that
20 correct?

21 A (WITNESS CURRY) Their effect is somewhat shadowed
22 by the reliability numbers, in that if you were to look at
23 the headings of these, each of these events, you will see
24 that there is a scale change in terms of their probabilities
25 of occurrence.

1 Q There is a scale change from the other two
2 transients, but there is no scale change between the case of
3 the proposed design versus the mid-1979 design for this
4 transient?

5 A (WITNESS CURRY) That is right. The scales for
6 all three transients are the same, regardless of the periods
7 in which we analyze. There is a difference in the scales
8 between the first two transients and the third.

9 Q Yes. But please, I do not want to go back to the
10 first two. I want to concentrate on this third transient
11 now.

12 A (WITNESS CURRY) I think it is necessary to answer
13 your question why there is no difference between the mid-'79
14 and the proposed design in case three.

15 Q Okay. If you wish, go ahead.

16 A (WITNESS CURRY) And the reason is that the
17 reliability number that is presented is a function of
18 dominant failure contributors. In my analysis, in the first
19 two cases where electric feedwater trains were available, it
20 turns out that the system unavailability was dominated
21 largely in mid-1979 by the probability of not getting the
22 feedwater control valves open on demand. That probability,
23 although dominant in a multi-train system, is no longer
24 dominant when one is reduced to a single train system, as
25 occurs in case three.

1 When reduced to a single train system, that is,
2 the turbine-driven train in case three, there are many
3 contributors to the system's unavailability, not to mention
4 the inherent reliability of the components themselves. So
5 that fixing one dominant contributor, it becomes quite clear
6 that you have fixed it in the first two cases, where it was
7 a heavy contributor; it is not clearly noticeable in the
8 third case, where it is one of many contributors.

9 Q Okay. What probability of failure for the
10 turbine-driven pump did you use in your analysis for this
11 third event?

12 A (WITNESS CURRY) Well, let me just look for a
13 second here.

14 (Pause.)

15 A (WITNESS CURRY) The turbine pump unavailability
16 that I used was approximately 1.5 times 10⁻².

17 (Pause.)

18 Q And perhaps you recall what Mr. Rowsome just
19 testified to. He thought perhaps the probability of failure
20 of turbine-driven pumps is 10⁻¹. Was that -- is my
21 recollection correct?

22 A (WITNESS CURRY) I recall that, and I have no
23 comment except to point out this is a common data base that
24 was used to compare all system reliabilities.

25 Q Okay. Well, fine. I mean, I understand when you

1 are comparing one system to another. But what I am trying
2 to pursue now is the reliability of this emergency feedwater
3 system at restart.

4 Now, you would agree with me that if the
5 probability of failure of the turbine-driven pump itself is
6 10^{-1} , then the probability of system failure under the
7 case of loss of main feedwater, loss of all AC power, would
8 be greater than 10^{-1} ?

9 A (WITNESS CURRY) Well, it certainly could be no
10 less than that.

11 Q Okay. Now, am I also correct that for this case
12 of total loss of all AC power we do not have the backup of
13 bleed and feed; is that correct?

14 A (WITNESS WERMIEL) That is correct.

15 Q So what this graph shows is -- and correct me if I
16 am wrong -- even using your figures, Mr. Curry, that the
17 probability of total loss of all decay heat removal systems
18 for Three Mile Island Unit 1 lies somewhere between one
19 chance in 10 and one chance in 100 for the event loss of
20 main feedwater coincident with loss of all AC power?

21 A (WITNESS CURRY) For that event.

22 Q That is how I phrased the question. Is that
23 correct?

24 A (WITNESS CURRY) Yes. I just wished to emphasize
25 that is for that initiating event.

1 Q And now we can ask you both, in your consideration
2 that the system is reliable enough to permit restart, what
3 did you consider to be the probability of total loss of all
4 AC power at Three Mile Island Unit 1?

5 A (WITNESS WERMIEL) I do not have a figure for that
6 number.

7 Q Mr. Curry?

8 A (WITNESS CURRY) No, I have not considered it at
9 all.

10 Q Then on what basis do you conclude that Three Mile
11 Island Unit 1 should be allowed to restart?

12 A (WITNESS WERMIEL) I think again we are looking at
13 comparisons, and we compare Three Mile Island Unit 1 with
14 other plants for this event and find that it is as good as
15 many and better than some.

16 Q Well, excuse me, I do not mean to be argumentative
17 at all. But it sounds to me like the conclusion the public
18 could draw from your testimony just now, that as long as all
19 plants are equally dangerous they should be licensed.

20 A (WITNESS CURRY) I think -- I think it is a
21 question in terms of plant safety. Your argument I think
22 really hinges on the probabilities of loss of all AC. Now,
23 I have not analyzed the probability of loss of all AC and
24 I'm not prepared to talk about the probabilities of loss of
25 all AC.

1 It is my judgment that it is a very low
2 probability event. However, that occurrence and the plant
3 risk being tied to that occurrence is not inconsistent with
4 some of the results that perhaps we are beginning to turn
5 up.

6 (Counsel for UCS conferring.)

7 BY MS. WEISS: (Resuming)

8 Q Would you elaborate on that, please, the results
9 that you are beginning to turn up?

10 A (WITNESS CURRY) Well, in the overall plant risk
11 studies that we have been conducting, we try to analyze what
12 are the dominant sequences that lead to the risk associated
13 with the operation of a nuclear power plant. And such
14 occurrences as station blackout do in some cases contribute
15 to the risk of the operation of the plant.

16 Q You mean that the probability of station blackout
17 becomes significant enough that you need to look closer at
18 the response of the plant in the event of that initiating
19 event?

20 A (WITNESS CURRY) Well, it is certainly something
21 we are looking at, yes.

22 Q Because if you do seriously -- if you seriously
23 consider the sequence and you have included it among the
24 three sequences that you have analyzed, you could hardly
25 come up with a figure that was less encouraging with respect

1 to the ultimate consequences of a loss of AC power than you
2 have for TMI-1. By that I mean, the chances are really
3 between one in 10 and one in 100 that a loss of AC power
4 results in total loss of, you know, decay heat removal
5 capability.

6 That is obviously a significant probability, and
7 it is one of your three scenarios. Why did you choose it?

8 A (WITNESS WERMIEL) We chose it for the purpose of
9 the study in the first place, which was to identify the
10 dominant failure contributors for these scenarios, to try to
11 correct them where we could, and to gain an overall
12 comparative capability to other plants.

13 Q Have you taken any steps to correct the situation
14 that results at TMI from loss of AC power?

15 A (WITNESS WERMIEL) We have examined --

16 A (WITNESS CURRY) In terms of EFWS operation, is
17 that what your question is?

18 Q (Nods in the affirmative.)

19 A (WITNESS WERMIEL) We have examined the dominant
20 failure contributors in this scenario and we have corrected
21 the deficiencies that we found for this case in the total
22 loss of AC case.

23 Q But with all the corrections --

24 A (WITNESS WERMIEL) With all the --

25 Q -- there is still a chance, between one in 10 and

1 one in 100, that you will lose, totally lose all decay heat
2 removal capability if you lose AC power at TMI-1?

3 A (WITNESS WERMIEL) That is correct, with the
4 single turbine-driven train. This is that probability.

5 DR. JORDAN: I want to ask one question here to
6 make sure that I am on board. In the case of a station
7 blackout, is there necessarily a loss of main feedwater? Is
8 that -- are those considered independent events?

9 WITNESS WERMIEL: You have no main feedwater in a
10 station blackout. And there is one other thing. Again,
11 this is a number for the immediate system coming on. There
12 is, again, a recovery time, a recovery capability for the
13 operator to perhaps get the turbine-driven pump train in
14 operation should it not go on automatically.

15 And it is not reflected in this -- in this
16 number.

17 CHAIRMAN SMITH: We are going to have to take some
18 time out to take the afternoon break. Is this an
19 appropriate time?

20 Dr. Little had to leave because she has a
21 conference call on another case, and we wanted the break to
22 coincide with her conference call.

23 (Recess.)

24 CHAIRMAN SMITH: Ms. Weiss, before the recess you
25 asked a question on page 39, the last sentence on the large

1 paragraph. And Dr. Little and I shared the same experience
2 when you read it. Neither of us understood it, but assumed
3 that everybody else did and we would worry about it later.
4 And I do not think I could diagram that sentence on a
5 blackboard or anyplace else, for that matter.

6 (Laughter.)

7 CHAIRMAN SMITH: It just is not a parse-able
8 sentence, I do not believe.

9 MR. BAXTER: I think everything after the colon is
10 the purpose.

11 MS. WEISS: That is what I was just going to ask.

12 BY MS. WEISS: (Resuming)

13 Q Would it be correct to read it as stating that the
14 purpose of the analysis is everything which is subsequent to
15 the colon?

16 A (WITNESS CURRY) Yes.

17 CHAIRMAN SMITH: That is --

18 BY MS. WEISS: (Resuming)

19 Q And does the sentence say that effort of
20 propagating the various component failure and human error
21 rates through the analysis is unnecessary and cumbersome, in
22 light of the purpose, which is then stated as everything
23 that follows the colon?

24 A (WITNESS CURRY) It is unnecessary to propagate
25 uncertainties throughout the analysis for the purpose, as

1 stated after the colon.

2 CHAIRMAN SMITH: For the purpose of the analysis,
3 which is?

4 WITNESS CURRY: As stated after the colon, or
5 which is the assessment of the reliability of a given
6 auxiliary feedwater design compared to other designs and the
7 identification of major contributors to a given auxiliary
8 feedwater system unreliability, so that system upgrading can
9 be most effectively undertaken.

10 CHAIRMAN SMITH: Okay.

11 BY MS. WEISS: (Resuming)

12 Q And I would just ask, finally, whether it is --
13 isn't it true that all of the analysis which you have
14 provided is a comparative analysis of the TMI auxiliary
15 feedwater system compared to other designs?

16 A (WITNESS CURRY) It is indeed a comparative
17 analysis. I tried to emphasize that by putting it on the
18 chart with other aux feed designs.

19 BY MR. POLLARD: (Resuming)

20 Q If we resume on the transient of loss of main
21 feedwater coincident with loss of all AC power, and if I
22 looked at the testimony on page 35, where we are comparing
23 the TMI-1 design with other plants, I notice that there are
24 five Westinghouse plants where the probability of failure of
25 emergency feedwater is one for this particular event. Those

1 plants are still permitted to operate, aren't they?

2 A (WITNESS WERMIEL) Yes.

3 I guess now is a good time to perhaps put case
4 three into perspective.

5 Q Well --

6 A (WITNESS WERMIEL) Case three is a postulated
7 event which is beyond the design basis currently for nuclear
8 power plants, the event being a station blackout. GDC 17
9 only requires that we postulated a single failure in power
10 supplies. We included the station blackout here to gain an
11 insight into this particular event and the AC dependencies
12 within the turbine-driven pump train.

13 BY MS. WEISS: (Resuming)

14 Q Is that perspective which you have just offered us
15 on the loss of all AC scenario, was that the topic of
16 discussion between you and your counsel during the break?

17 A (WITNESS WERMIEL) I discussed it with counsel,
18 yes.

19 Q Let me ask you this: If you had found as a result
20 of your analysis that the probability of total loss of decay
21 heat removal capacity at TMI upon the initiating event loss
22 of AC power were one, would that have changed your
23 conclusion at all with respect to whether it is appropriate
24 to allow this plant to restart?

25 MR. BAXTER: Are we still talking about the

1 five-minute time frame?

2 BY MS. WEISS: (Resuming)

3 Q I am talking about the terms of your analysis,
4 that is correct.

5 A (WITNESS WERMIEL) In terms of this analysis, I
6 believe it would. I think we would want to have corrected
7 the AC dependencies in this train prior to restart. Again,
8 in dealing with the overall station blackout scenario, the
9 recovery capability of the turbine-driven train, the
10 recovery of the diesel and the recovery of the loss of
11 offsite power are not reflected in the number that is shown
12 here.

13 Q What is the probability of a loss of all AC power
14 at TMI-1?

15 A (WITNESS WERMIEL) I do not know the specific
16 number for TMI-1. It is a low probability event in
17 general.

18 Q Well, you are comparing in some sense at least the
19 risk at TMI-1 with the risk associated at other plants.

20 A (WITNESS WERMIEL) No, we are not, because this
21 is not an attempt to show how this event might lead to core
22 damage or impact on public health and safety. It is merely
23 an attempt, as I characterized already, to eliminate
24 dominant failures in the particular turbine-driven pump
25 train we are talking about.

1 Q Do you know whether, for any of the other plants
2 listed -- and maybe I would particularly direct your
3 attention to the five which do have a probability of one,
4 loss of AC power, loss of decay heat removal capability,
5 whether the probability of loss of AC power is any greater
6 or less at those plants compared with TMI-1?

7 MR. BAXTER: Mr. Chairman, I'm going to object at
8 this point. I did not understand this to be the focus or
9 even a part of the Board's interest expressed in Board
10 question 6, and that is the likelihood of station blackout
11 at TMI-1. And as a matter of fact, I can recall having
12 Witness Torcivia here and told he could go home last fall
13 when he was here to testify on Board question 6 as to the
14 reliability of our offsite power supplies, because that
15 simply was not what the Board was interested in, it was the
16 emergency feedwater system and its reliability.

17 (Board conferring.)

18 CHAIRMAN SMITH: This is a gray area. The Board
19 itself would not be asking these questions, but the
20 testimony is produced and the findings can be based upon the
21 testimony, and it should be subject to cross-examination.

22 MR. BAXTER: The testimony says absolutely nothing
23 about the probability that these initiating events will
24 occur. In fact, they already said they do not have such or
25 have not made such analyses. And so now we are asking for

1 comparisons of TMI-1 versus the other.

2 MS. WEISS: I am trying to inquire into the
3 usefulness of this analysis and the purpose to which the
4 witnesses put it in determining whether it is appropriate or
5 whether they would recommend that TMI should be permitted to
6 restart.

7 They have said that, at least with respect to this
8 AC power scenario, Mr. Wermiel said the dominant reason in
9 his mind was that there were some plants that were worse and
10 there were some that were no better. And I am trying to get
11 a fix on how far that went. Did they really look at to any
12 extent what the risk was comparatively between TMI and the
13 other plants for loss of AC power.

14 CHAIRMAN SMITH: Mr. Brenner has pointed out to me
15 that Board question 6-H is: "Can the turbine-driven pumps
16 involved be operated on direct current or are they dependent
17 upon the alternating current safety buses," which is the
18 next step down from this case.

19 DR. JORDAN: That is true, and the reason was I
20 wanted to find out if it would survive a loss of -- a
21 station blackout, because I know that there are some plants
22 that could not.

23 CHAIRMAN SMITH: So that objection --

24 MR. BAXTER: I understand we are looking at what
25 happens after station blackout. That is what case three

1 is. That is what the question is.

2 But now we are exploring the probability for
3 station blackout.

4 MR. CUTCHIN: Mr. Chairman, I might interject here
5 as well. I am not objecting to these questions. But I
6 think one thing the Board could keep in mind, and that is
7 that we have not often, if at all, objected to Board
8 questions, even though we may have viewed those questions to
9 carry beyond what we view to be the scope of the proceeding,
10 in the desire to give the Board whatever information it
11 wanted. But to carry that too far in allowing other parties
12 to bootstrap on that puts us at somewhat of a disadvantage.

13 CHAIRMAN SMITH: Yes, it does. But under
14 Commission rules, precedent, other parties can participate
15 fully on Board questions and develop the record, and
16 anything that is produced as a Board question can be
17 proposed as a finding against the interests of the Union of
18 Concerned Scientists.

19 MR. CUTCHIN: Then maybe, Mr. Chairman, I guess
20 for the future the question may have to be posed as to
21 whether, in response to Board questions that come out of the
22 blue, the Board believes that they have identified a
23 serious, or whatever the new term is, safety concern that
24 warrants hearing in this proceeding.

25 I am not pressing it. I am just making the point

1 that if we carry this too far we can stay here forever.

2 CHAIRMAN SMITH: You are right. You are right as
3 far as that is concerned. There just has to be, of course,
4 some cutoff point. I think that we would probably make the
5 cutoff point on the Board question closer than on a
6 contention raised by the Union of Concerned Scientists. I
7 will just have to simply go by the judgment of Dr. Jordan
8 whether he wants the answer or not, and Dr. Little.

9 DR. JORDAN: Well, I certainly do not feel that
10 there is a close nexus between the loss of AC power, loss of
11 all power, and the TMI-2 accident. And I do not expect to
12 explore that avenue with my questions at all.

13 I did want to know, and I did find out, that they
14 do have turbines and they are DC-operated, and that was the
15 extent of my interest. Now, I do not mind -- I think if the
16 witness can answer this question, do they know how this grid
17 and these generators compare in reliability with others,
18 fine.

19 But I suspect that we are just not going to make
20 any headway on this. This is what I think.

21 MS. WEISS: I think the witness was indicating
22 before the objection that he did not have any information on
23 it, anyway.

24 CHAIRMAN SMITH: I try to remind myself, before we
25 entertain a lot of arguments we should always ask if the

1 witness knows the answer to the question, and we can get
2 directly to it.

3 So you do not have an answer to the question?

4 WITNESS WERMIEL: No, I have no answer to that
5 question.

6 CHAIRMAN SMITH: Okay.

7 BY MR. POLLARD: (Resuming)

8 Q In the course of our discussion on this particular
9 transient, Mr. Wermiel, I think you mentioned that there was
10 the possibility for the operator to take action and correct
11 the difficulties. And I seem to get from your testimony the
12 feeling that you think this operator action would be
13 successful in some time period longer than five minutes; is
14 that correct?

15 A (WITNESS WERMIEL) The operator's action would be
16 successful in the five minutes?

17 Q In some period of time longer than five minutes,
18 in restoring some type of decay heat removal system?

19 A (WITNESS WERMIEL) Yes, I do, I do think his
20 action would be successful over a period of time.

21 Q Are you familiar enough with the actual accident
22 at Three Mile Island Unit 2 to recall how long it took the
23 operators to correct the mistake of shutting off high
24 pressure injection flow?

25 A (WITNESS WERMIEL) No, I am not familiar enough

1 with the accident sequence to recall when he realized he
2 needed his high pressure injection.

3 Q Are you familiar enough with the accident to be
4 able to say that in fact it was operator actions which
5 compounded the accident, rather than led to mitigation of it
6 in the early stages?

7 A (WITNESS WERMIEL) I am aware that operator
8 actions did have an effect on the end result in the TMI-2
9 scenario.

10 Q Would you agree that in addition to simply loss of
11 or collapse of the offsite grid or failure of the diesel
12 generators to start, that there could be other events that
13 would result in total loss of AC power to the systems at
14 Three Mile Island Unit 1, for example such as a fire?

15 A (WITNESS WERMIEL) My understanding is that if you
16 have such a severe fire it could engulf all AC power
17 systems, I would presume. I have not looked at fires
18 specifically to determine this.

19 (Counsel for UCS conferring.)

20 CHAIRMAN SMITH: Mr. Pollard, I think the time now
21 has come where you are going to have to make some choices.
22 We are going to have limited appearance statements at 5:00
23 o'clock, which means that we will not have further
24 opportunity after that. We cannot go much more than an hour
25 and a half, if that much, of hearing time left.

1 So to the extent that you use the time, you are
2 not going to be present when other people ask questions of
3 this panel.

4 MR. POLLARD: Yes, I understand that, Mr.
5 Chairman.

6 (Pause.)

7 CHAIRMAN SMITH: Oh, yes. Reading my statement in
8 a void suggests that we are saying that you cannot come
9 back. I am just taking your own restriction.

10 MS. WEISS: Mr. Brenner --

11 CHAIRMAN SMITH: We have --

12 MS. WEISS: He watches you like a mother hen.

13 (Laughter.)

14 MR. POLLARD: In fact, it is this pause where I am
15 trying to exactly consider the factors which you remind me
16 of, in looking at my cross-examination plan, to decide
17 exactly the point you raise.

18 (Pause.)

19 BY MR. POLLARD: (Resuming)

20 Q Mr. Curry, beginning at the bottom of page 36 of
21 your testimony, you list the dominant contributors to
22 unavailability of the emergency feedwater system for the
23 mid-1979 design. Can you tell me what the dominant
24 contributors are to the unavailability of the system in the
25 proposed design case?

1 A (WITNESS CURRY) In the proposed design case,
2 there really are not any contributors to that -- that
3 contribute significantly more to the availability of the
4 system than many others. In other words, the proposed
5 design case represents a conglomeration and there are not,
6 in the term that we use, dominant contributors. I do not
7 recall any that are clearly head and shoulders above the
8 rest.

9 DR. JORDAN: I will be asking you, perhaps
10 tomorrow, as to why it is that some of the Westinghouse
11 designs seem to be quite a lot superior. But that is not a
12 question from me today.

13 (Pause.)

14 BY MR. POLLARD: (Resuming)

15 Q When you prepared your testimony and you listed
16 the dominant failure modes for the mid-1979 design, I can
17 see from your testimony you have had some consultation with
18 Mr. Capodanno. And in his testimony, in Licensee Exhibit
19 15, he listed different dominant failure modes for that
20 design, including potential plugging of the emergency
21 feedwater pump suction strainers.

22 I use this as an example to ask: Did you attempt
23 to compare your analysis of the mid-1979 design with that
24 performed by the Licensee to try and identify why you found
25 different dominant contributors than the Licensee did?

1 A (WITNESS CURRY) Okay. I believe the Capodanno
2 testimony is based on the B&W analysis that was submitted to
3 the staff for review. I do not have the testimony in front
4 of me, but I believe that is the case.

5 Q Well, I can loan you my copy of Licensee's Exhibit
6 15. But where I picked out the example from is an
7 introductory sentence on page 10 of Licensee Exhibit 15,
8 which states: "For TMI-1, the three major component
9 failures which contribute to system unavailability are," and
10 he lists three, one of which is potential plugging of the
11 pump suction strainers.

12 I just use that as an example.

13 A (WITNESS CURRY) I understand.

14 Q And the question was, did you make any attempt to
15 compare your analysis to the Licensee's analysis for the
16 purpose of trying to determine why you reached different
17 conclusions regarding the dominant failure modes?

18 A (WITNESS CURRY) I understand the question, and I
19 am just trying to establish the fact that I believe that
20 Licensee's analysis is the B&W analysis that was submitted
21 to the staff. And if indeed that is the case, yes, I have
22 made a comparison.

23 Okay. Yes, I do have a copy of the testimony, and
24 I see on page 9 that the Licensee did refer to the B&W
25 analysis. So that is his -- I conclude that is his analysis

1 that he is referring to.

2 So the answer to your question is, yes, I have
3 reviewed the Licensee's, quote, unquote, "analysis."

4 Q Can you explain to me, then, why the Licensee
5 concluded a dominant contributor was plugging of the
6 strainers, which you did not conclude?

7 A (WITNESS CURRY) Okay. Well, once again it is
8 probably a reflection of differences in assumptions that the
9 Licensee made and I made. In the B&W report, there was
10 identified a common mode failure or a potential for the
11 common mode failure to open both normally-closed feedwater
12 control valves, in that they were both controlled by the ICS
13 and the ICS was not separated in its entirety to both
14 control valves.

15 I in my analysis found that to be the dominant
16 failure, since in a five-minute time period I did not credit
17 any operator recovery to reopen such a failure. I suspect
18 -- well, I do not know if you want me to draw conclusions
19 why I differ from the applicant. But my unavailability
20 number for TMI-1 at that time was higher than that predicted
21 by B&W, and that assumption about a nonrecoverable failure
22 within five minutes due to the single ICS failure is, I am
23 sure, largely the reason why.

24 (Counsel for UCS conferring.)

25 Q When you did your fault tree analysis, can you

1 point to me in the fault tree, if you did. where you
2 inputted the possibility that one main feedwater train was
3 out of service, as permitted by the technical
4 specifications?

5 A (WITNESS CURRY) Okay. The fault tree that you
6 have is one for the proposed design. But what you are
7 talking about would be entered under the test and
8 maintenance unavailability event.

9 Q Can you tell me, please, what probability you
10 assigned to that box?

11 A (WITNESS CURRY) I used 2.6 times 10⁻² as an
12 unavailability.

13 Q And that was on the assumption of how often would
14 this loophole or this provision of the tech specs be used?

15 A (WITNESS CURRY) It was my understanding -- and I
16 think the actual words were read earlier -- but I based that
17 estimate on the words, essentially, if two 100 percent
18 capacity paths were unavailable for 72 hours, the plant must
19 be placed in a condition not requiring steam generator
20 cooling. That was NUREG-0680, page C.2-6.

21 Q Excuse me. Let me state the question more
22 specifically. From my experience there have been instances
23 in the past where technical specifications allowed a
24 particular component to be out of service, let's say, for 48
25 hours. They restore the component to service in 47 hours,

1 and then the next day it was out of service again, and they
2 allowed it to remain out of service for another 47 hours,
3 and then had it in service for an hour and then out of
4 service again.

5 Now, that is -- the question I am asking is, in
6 computing the probability for the box of test and
7 maintenance availability, what percent of the time in a
8 given calendar year, as an example, did you anticipate that
9 one train of the emergency feedwater system would be
10 unavailable because of this technical specification
11 provision?

12 A (WITNESS CURRY) Because of the technical
13 specification provision, which is essentially what I think I
14 just quoted, the number that I arrived at, that is the
15 fraction of time which the system is unavailable due to
16 tests or maintenance, was 2.6 times 10⁻².

17 That is, in 100 hours it would be unavailable for
18 2.6 hours.

19 (Pause.)

20 Q And that data came from?

21 A (WITNESS CURRY) That was calculated assuming that
22 indeed they did have a system out for the maximum 72 hours
23 allowed by the tech specs. And it was -- took into account
24 the average time between component failures or maintenance
25 that was used in WASH-1400.

1 (Counsel for UCS conferring.)

2 Q I have just a few questions on the actual fault
3 trees.

4 MR. POLLARD: At this point I would just like to
5 bring up, Mr. Chairman, my concern that the copies of these
6 fault trees that are physically in the record are
7 illegible.

8 CHAIRMAN SMITH: Yes, we noticed that.

9 MR. POLLARD: Perhaps that can be corrected at
10 some future time.

11 BY MR. POLLARD: (Resuming)

12 Q On the second page of the fault trees, under the
13 subtrain of turbine pump failure, can you explain to me the
14 significance of the note underneath the diamond labeled
15 "support system faults"? And if I am correct, that reads:
16 "DC power assumed available, forced air cooling after two
17 hours."

18 Am I correct in interpreting that note that you
19 assigned no probability to DC system failure, or a zero
20 probability of DC system failure?

21 A (WITNESS CURRY) No. IC support system failures,
22 again these transients by definition assume that DC power is
23 available.

24 Q So the answer to my question is, yes, you assigned
25 a zero probability to DC power system failure?

1 A (WITNESS CURRY) Well, to give the right
2 perspective, I did not have to assign it. It was an
3 assumption of the initiating transient.

4 Q And it is correct that if DC power was
5 unavailable, that the success of emergency feedwater would
6 be lower, the success rate or the probability of failure
7 would be higher than what you have reported?

8 A (WITNESS CURRY) Well, of course, I would have to
9 take into account whether you are assuming we have AC power
10 available.

11 Q Well, yes, you are quite correct. I am talking
12 about the transient in which we are looking at the
13 turbine-driven pump under the conditions of loss of all AC
14 power. For that analysis you simply assumed that there was
15 DC power available?

16 A (WITNESS CURRY) Yes. If you wish to postulate a
17 transient where all AC power --

18 Q I do not wish to postulate a transient other than
19 the question I asked.

20 A (WITNESS CURRY) If you wish to query the question
21 about loss of all AC power, certainly loss of DC power could
22 contribute to the unavailability of the system in that
23 transient.

24 Q But you did not consider that?

25 A (WITNESS CURRY) No, sir.

1 (Pause.)

2 Q On page 5 of the fault trees -- I am sorry, my
3 notes are wrong. Page 6. I have a question on the footnote
4 that is on that page, which reads, quote:

5 "With control valve ESV-8C full open, EST-2B will
6 provide 385 gpm."

7 Just that part of the footnote; what is the source
8 of that information?

9 A (WITNESS CURRY) I would like to check. I believe
10 it is the B&W report that had been submitted. I can check
11 on that if you like.

12 Q In other words, am I correct that the source of
13 information is not a test of the system?

14 A (WITNESS CURRY) I am not sure how the number in
15 the B&W report came about.

16 Q Do you know whether the number assumes delivery to
17 one or both steam generators?

18 A (WITNESS CURRY) I am not sure it is material. I
19 think --

20 Q There has been previous testimony that the flow
21 rate would be different if you were delivering to one or
22 both steam generators.

23 A (WITNESS CURRY) I would have to look at the B&W
24 number. Like I said, I am not quite sure of the reference.

25 (Counsel for UCS conferring.)

1 Q I have just two other questions. For the event
2 loss of main feedwater, total loss of AC power, when you
3 calculated the failure probability for that transient did
4 you assume the availability of the river water system as an
5 alternate source of water? That is the first question?

6 A (WITNESS CURRY) No.

7 Q Did you assume the availability of water from the
8 hot well?

9 A (WITNESS CURRY) I would have to look on the fault
10 tree. I believe there was some AC valve associated with
11 that, securing flow from the hot well. So in that case I
12 would not have assumed it.

13 Q You would not have assumed it?

14 A (WITNESS CURRY) Not if it was an AC dependency

15 Q Now --

16 (Counsel for UCS conferring.)

17 Q On page 41 of your testimony, where you are
18 discussing how the maximum reliability achievable could vary
19 for plants with differing nuclear steam supply systems, you
20 list several factors: smaller inventory in the steam
21 generator, the number of loops or the number of steam
22 generators.

23 Am I correct, those are the two main factors that
24 you discuss there?

25 A (WITNESS CURRY) Well, those were two that were

1 clearly used for an example. Yes, those were the two that
2 were in there, right.

3 Q Now, looking at the charts on pages 35 and 37, it
4 does not matter which one for this question, are you aware
5 that the Point Beach plant is a two-loop plant?

6 A (WITNESS CURRY) Well, I am aware that there are
7 some Westinghouse two-loopers, if that is your point. I
8 did not mean to imply that all Westinghouse plants were
9 either three or four-loopers.

10 Q Well, for a plant, a Westinghouse plant with two
11 loops, what would you say is the reason for not having as
12 high a reliability of the Three Mile Island Unit 1 emergency
13 feedwater system as compared to the emergency feedwater
14 systems in a two-loop Westinghouse plant?

15 A (WITNESS CURRY) Well, probably the dominant
16 reason is -- and once again, it is tied to the success
17 criterion, in that we analyze for the possibility of steam
18 generator dryout, and in general in Westinghouse plants the
19 probability of steam generator dryout are longer.

20 Q In other words, then, it is your opinion, if you
21 extended the time available for emergency feedwater to be
22 successful, that the operator could correct it and therefore
23 the probability at Three Mile Island Unit 1 would be
24 comparable to Point Beach?

25 A (WITNESS CURRY) Well, without looking at Point

1 Beach, I cannot say. But --

2 A (WITNESS WERMIEL) I think you have to understand
3 some of the differences in the Point Beach design. Their
4 auxiliary feedwater system is somewhat different in design
5 than TMI's.

6 Q Okay. Thank you.

7 MR. POLLARD: We have no further questions of
8 these witnesses at this time.

9 CHAIRMAN SMITH: Mr. Dornsife?

10 BY MR. DORNSIFE:

11 Q Mr. Curry, the figure you handed out, which you
12 call attachment 3, I think we had a discussion that the
13 improvement in reliability between the restart and the
14 proposed design is a factor of 18, I believe, or something
15 of that order. Maybe it is 9, I am not sure. But it is
16 much larger than the improvement over the previous design.

17 Can you tell me what is the dominant contributor
18 to that increase, because there are very few things that are
19 being added?

20 A (WITNESS CURRY) Once again, for the securing of
21 flow to the steam generator within five minutes, the
22 automatic safety grade actuation makes a big difference.

23 Q Does the level indication on the condensate pump
24 have any contribution to that improvement, the redundancy in
25 the condensate level tank?

1 A (WITNESS CURRY) It would probably plan some role
2 in assuring that there was water in the condensate storage
3 tank to start off with. But I believe the major increase in
4 improvement is due to the automatic actuation of the
5 system.

6 Q Mr. Wermiel, concerning the condensate level
7 tanks, without assuming a normally-opened valve being
8 closed, is there any way the condensate tanks will not drain
9 down equally?

10 A (WITNESS WERMIEL) No. In their normal
11 configuration, they would -- they should drain down in an
12 equal manner.

13 Q And are the current level indicators supplied from
14 redundant power sources?

15 A (WITNESS WERMIEL) No.

16 Q Diverse power sources?

17 A (WITNESS WERMIEL) My understanding is the level
18 indicators on the tanks now are powered from the same bus.

19 (Pause.)

20 Q Do you have the restart SER, NUREG-0680?

21 A (WITNESS WERMIEL) Yes, I do.

22 Q Look at page C.1-8, Item No. 1. Is that --
23 (Witnesses reviewing document.)

24 A (WITNESS WERMIEL) Yes, sir.

25 Q Doesn't it say that they are supplied from

1 separate redundant power, supplies?

2 A (WITNESS WERMIEL) This is talking about the new
3 ones, I believe.

4 Q This is required prior to restart, it says.

5 A (WITNESS WERMIEL) Where does it say that?

6 Q The last sentence up above: "We require the
7 Licensee to implement the following items prior to
8 restart."

9 A (WITNESS WERMIEL) That is going to have to be
10 corrected in the supplement.

11 Q Okay.

12 A (WITNESS WERMIEL) Because I indicated in my table
13 that is now -- when this was written, NUREG-0737 was not
14 out. We did not -- we were under a different impression at
15 that time.

16 Q Would the major problem with the reliability or
17 the availability of those level indicators be due to the
18 fact that they are powered from the same power supply?

19 A (WITNESS WERMIEL) I do not know if it is a major
20 factor. It is certainly one source of failure in one
21 indicators, but it may not be the major source of failure.

22 Q Was that considered in your study, Mr. Curry?

23 A (WITNESS CURRY) Yes, it was. I do not believe it
24 is a major contributor. I found -- my concern in terms of
25 major contributors was the miscalibration of those level

1 indicators.

2 Q But that could occur if you had three level
3 indicators. As far as correctable types of design
4 deficiencies, that would probably be the major contributor.

5 A (WITNESS CURRY) Which would?

6 Q The power supply, diverse power supply, redundant
7 power supplies.

8 A (WITNESS CURRY) In terms of hardware changes,
9 philosophically, you will get improvement, obviously, if you
10 have separate power supplies. It is less likely to fail two
11 power supplies than one power supply. So you will get some
12 improvement.

13

14

15

16

17

18

19

20

21

22

23

24

25

1 Q So under the existing scheme of having a level
2 indicator on each tank and just by the fact of adding a
3 diverse power supply could probably very measurably improve
4 the reliability of that system with a fairly simple change,
5 changing the power supply.

6 A (WITNESS CURRY) I am not sure that adding an
7 additional power supply, if that was your question, will
8 make a great difference.

9 Q My question was to, first of all, make them vital
10 power supplies, put them from diverse power supplies -- in
11 other words, the A condensate storage tank would come from
12 the A power supply. The B would come from the B power
13 supply.

14 A (WITNESS CURRY) And that certainly would improve
15 the reliability of the system. It is, again, I do not
16 believe, a major contributor now to the unavailability of
17 the system.

18 Q But as far as that particular change, it would be
19 a major factor, that particular item.

20 A (WITNESS CURRY) Well, again, I do not believe you
21 are buying much in terms of reliability by adding it.
22 Certainly philosophically you are, though, adding
23 reliability, but it does not seem to make quantitatively a
24 great difference.

25 Q But with that particular problem it would make a

1 difference, and that is something that could be done prior
2 to restart.

3 A (WITNESS CURRY) Which particular problem is that?

4 Q The problem of level indication on the condensate
5 storage tanks.

6 A (WITNESS CURRY) Well again, if one were concerned
7 with the level indication failing, I believe that the major
8 reason it fails would be due to some miscalibration, common
9 mode miscalibration of both levels. So the thing to do
10 there is to make sure there are administrative procedures to
11 try to minimize that common mode. In other words, don't
12 have the same man with the same instrument check both level
13 indicators.

14 Q But that could be done with just two indicators in
15 the current scheme.

16 A (WITNESS CURRY) Yes.

17 Q You say that the major contributor, which is the
18 flow control, the automatic flow control -- is that correct
19 -- as far as existing restart to proposed, would be required
20 a year after restart; is that correct?

21 A (WITNESS CURRY) Okay. The major contributor to
22 the unavailability of the system as it was --

23 Q I am talking between restart and what it will be.

24 A (WITNESS CURRY) The biggest change or improvement
25 in reliability will result from the automatic -- at this

1 five-minute time period in terms of securing flow within
2 five minutes will occur due to the addition of automatic
3 actuation, safety-grade actuation of the system.

4 Q Okay.

5 A (WITNESS CURRY) I might add, safety grade, the
6 concern that I have is the separation from the reliability.
7 It is the separation that gives real meaning to that term.

8 Q Is it the current control system through ICS and
9 also the current start system through ICS? Isn't that
10 true? So I am not sure why their contributions would be a
11 major difference in terms of --

12 A (WITNESS CURRY) There is a single failure in the
13 ICS, as I am lead to believe from the information I have,
14 that will prevent you from opening those normally closed
15 valves.

16 Q As far as improvement in overall risk reduction to
17 the life of the plant, how much would allowing that system
18 to operate for a year as designed at restart or as
19 anticipated at restart be compared to having the thing fully
20 comply with all long-term requirements over its lifetime?
21 How much would it change the risk?

22 A (WITNESS CURRY) Well, without a detailed study of
23 the risk of the plant of the caliber of the IREP-type
24 studies that Mr. Fowsome had mentioned before, I cannot
25 quantitatively tell you how the risk would change. I should

1 point out that is the key question in that it talks about or
2 includes the integrated response of the plant.

3 Certainly I would expect that plant operators
4 would be well aware of their system during that year and in
5 a time frame related to the uncovering of the core and core
6 damage sequences, I do not find the reliability of the
7 system unacceptable.

8 Q Let's just say from the numbers you have given,
9 the restart design unavailability of 3×10^{-3} per demand,
10 and if the feedwater demands were three times a year, which
11 number was thrown around, that gives you a total failure
12 rate of 10^{-2} per reactor year.

13 A (WITNESS CURRY) Okay. Let's --

14 Q Then also compare that with, for one year, compare
15 it to the 40-year lifetime. It seems to me it is no more
16 than a factor of 2 overall increase in risk to allow that
17 one additional year of operation. Is that not a rough --

18 A (WITNESS CURRY) Well, there is a little bit more
19 to be taken into account because, again, it is not fair to
20 consider that the auxiliary or emergency feedwater system
21 reliability in terms of mitigating accidents is the same at
22 20 minutes as it is at 5 minutes. So that, and in
23 consideration of other mitigating systems and in
24 consideration of the fact that while we use three transients
25 per year at the Commission, it may be a conservative number,

1 so I would have to sit down and think about the difference
2 in risk.

3 But your line of reasoning is in the right
4 direction, anyway.

5 Q But that is one of the considerations you used as
6 far as accepting a year as being an acceptable time period
7 for making this.

8 A (WITNESS CURRY) Clearly --

9 Q Is there any number that would have told you it
10 was unacceptable?

11 A I would probably be concerned if -- and this is
12 strictly judgment, my judgment -- I would not like to see
13 this unavailability at 20 minutes. Such an unavailability
14 would take into account operator action, and if it was still
15 this high when it could be fixed I would not be unhappy --
16 happy with it, nor would I like to see it significantly
17 higher than it is now at 5 minutes.

18 Q Mr. Wermiel, you said in a question from Mr.
19 Pollard that as far as loss of emergency feedwater occurring
20 as a result of a steamline break, that the acceptable
21 probability as far as you were concerned was 10⁻⁶ for that
22 steamline break, and I am wondering are the consequences of
23 a loss of all feedwater any different than the consequences
24 of a main steamline break as far as removing decay heat?

25 As a follow-on, in your opinion why is it

1 acceptable to have a proposed design of 4×10^{-4} as a
2 total EFW reliability or unavailability in terms of loss of
3 main feedwater, but 10^{-6} in terms of main steamline break?

4 A (WITNESS CURRY) Just as a point of information, I
5 am not sure that we said anything about 4×10^{-4} as a
6 design for loss of main feedwater mitigation systems.

7 Q But that is the unavailability of emergency
8 feedwater.

9 A (WITNESS CURRY) It is the unavailability of
10 emergency feedwater, the proposed design of emergency
11 feedwater at 5 minutes, emergency feedwater only. It has
12 nothing to do with other systems involved.

13 A (WITNESS WERMIEL) That is right. I cannot compare
14 what you have postulated with respect to these numbers to
15 the overall concern of core melt because there again are
16 mitigating systems which have not been included in your
17 accident scenarios that are available to you.

18 Q For a main steamline break aren't they also
19 available?

20 A (WITNESS WERMIEL) That is what I am trying to
21 say; they are. Certainly feed and bleed is available in the
22 event of a main steamline break.

23 Q My question is: You said anything above 10^{-6}
24 would be unacceptable, I believe. Maybe you did not mean to
25 say that.

1 A (WITNESS WERMIEL) I do not remember what I said
2 exactly. I thought what I was trying to say was that I was
3 under the assumption and belief from what I have heard that
4 -6
5 10 is a number that we use for the probability of a main
6 steamline break.

7 Q But I think you said that anything below that
8 would be unacceptable to you as far as --

9 A (WITNESS WERMIEL) I believe I said as far as
10 environmental qualification of the equipment, though, as
11 much as I recall. I think that is what we were saying. I
12 think from that standpoint we would want to qualify the
13 equipment.

14 CHAIRMAN SMITH: Mr. Dornsife, may I have just a
15 moment. If we are going to get to offsite emergency
16 planning tomorrow, it would be very helpful if Mrs. Moran
17 could call up those intervenors and advise them, so I would
18 like to take just a moment and compare notes and see how
19 much more examination there is going to be with this panel.

20 MR. DORNSIFE: This is my last question.

21 CHAIRMAN SMITH: That was not the purpose of my
22 interruption, however.

23 (Laughter.)

24 CHAIRMAN SMITH: Mr. Baxter, could you be
25 helpful?

Is this one of your usual one more questions, or

1 is it really one more question.

2 MR. DORNSIFE: One more question.

3 CHAIRMAN SMITH: Okay.

4 Mr. Baxter.

5 MR. BAXTER: I did not say one more question. I
6 haven't started.

7 CHAIRMAN SMITH: Okay.

8 MR. BAXTER: I would estimate 15 to 20 minutes.

9 (Board conferring.)

10 CHAIRMAN SMITH: All right. We are advising the
11 lead intervenor that emergency planning may begin at
12 1 o'clock tomorrow afternoon. I would appreciate it if
13 counsel would advise the cognizant counsel of that.

14 Mr. Dornsife.

15 BY MR. DORNSIFE: (Resuming)

16 Q I guess maybe you may have misunderstood my
17 question. It seems that you are using a different criteria
18 for judging the system when it is unavailable due to a main
19 steamline break or when it is unavailable due to its
20 unavailability from other things that are identified by Mr.
21 Curry's work.

22 It seems that in either case if you have a loss of
23 main feedwater or a main steamline break, you have to remove
24 decay heat, and you need the system -- you have the same
25 backup systems in either case, but in one case you are using

-6

1 a criteria 10^{-4} , but in this case you say it is acceptable
2 to have 4.5×10^{-4} as an unavailability with loss of main
3 feedwater.

4 A (WITNESS CURRY) May I just comment on the
5 probabilities? I do not think it is a matter of accepting
6 or not accepting. It is just that there are contributors to
7 the unavailability of the EFWS that add up to 4×10^{-4} . If
8 you add to that a main steamline break as a contributor,
9 4×10^{-4} plus 10^{-6} is not discernible.

10 Q No, I am talking about two different events. I
11 am talking about the system being available, assuming you
12 have a main steamline break in the intermediate building.

13 A (WITNESS WERMIEL) I may have -- I hope I did not
14 mislead you into thinking that we are licensing based on the
15 number. The GDC is specific. The system required to
16 mitigate a particular event must be qualified for the
17 environment it will see from that event. It is a
18 deterministic approach. There is no number attached to it.

19 Therefore, because you need emergency feedwater to
20 mitigate a main steamline break, if that environment from
21 the main steamline break can affect the system, it must be
22 qualified to that environment. That is a deterministic
23 requirement.

24 What the number was meant to imply was in
25 backfitting a plant where we had found noncompliance, we

1 had to consider other things, and other things than are the
2 probability of such an event over an interim period of time
3 where the system may not be in compliance. And I believe
4 the number 10^{-6} was used only in that that is -- I believe
5 that is still the currently acceptable probability of a main
6 steamline break.

7 I did not mean to imply that that was acceptable
8 as opposed to 4×10^{-4} being acceptable.

9 Q My concern was I believe that in answer to Mr.
10 Pollard's question you said that if the probability of a
11 main steamline break were greater than 10^{-6} , then you
12 would want to take some corrective action.

13 A (WITNESS WERMIEL) Yes, I think I would, but I do
14 not know how much greater. You know, we would have to look
15 at that. The context of that I remember clearly. If there
16 was a flaw in the steamline or something in the steamline
17 that led us to believe 10^{-6} was erroneous, I think we
18 would then have to take that into consideration and I think
19 we would want to do something about it. That is what I was
20 trying to say.

21 MR. DORNSIFE: I have no further questions.

22 CHAIRMAN SMITH: Mr. Baxter.

23 BY MR. BAXTER:

24 Q Mr. Wermiel, yesterday on your direct examination
25 when you were correcting the table we started testimony

1 about the installation of safety grade auto initiation of
2 emergency feedwater not taking place prior to restart. Mr.
3 Capadano on behalf of the Licensee testified here earlier
4 that there will be in place prior to restart safety grade
5 automatic initiation of the emergency feedwater pumps.

6 So, what are you describing when you say there
7 will not be a safety grade automatic initiation system?

8 A (WITNESS WERMIEL) I believe NUREG-0737 and the
9 Lessons Learned document, 0578, are explicit. They state
10 you must have safety grade automatic initiation of emergency
11 feedwater system function. The function of the emergency
12 feedwater system is not to turn on pumps. It is to deliver
13 water to the steam generator. I will agree you will have
14 safety grade pump initiation, but that does not assure you
15 that the flow control valves will also be open when the
16 pumps come on.

17 Q I understand. I was just trying to clarify what
18 you meant.

19 A (WITNESS WERMIEL) That is what I mean by that.

20 Q Mr. Curry, there was some examination of UCS by
21 you about using Attachment 3 to your testimony as a
22 measurement of the improvement in reliability from hardware
23 changes up to the time of restart and then afterward.

24 Isn't it true that since your analysis uses five
25 minutes and this attachment uses five minutes as a success

1 criterion and therefore, as you testified, allows no credit
2 for operator recovery action, the analysis also does not
3 show improvements in reliability associated with new
4 hardware being installed at TMI-1 which will allow for
5 manual option by the operator to correct problems?

6 A (WITNESS CURRY) Well once again, that is the same
7 thing. There is no credit for the operator action.

8 Q Or new hardware that has been installed but will
9 facilitate that operator action?

10 A (WITNESS CURRY) No, no credit for operator action
11 at all in that interval.

12 Q In NUREGs-0635 and 0611 which you referenced, the
13 statement appears that the staff recognized it would be very
14 difficult and subject to large uncertainty if an attempt was
15 made to quantify the reliability improvement inherent
16 through implementation of the recommended actions.

17 Do you agree with that statement, and would you
18 advise the Board to utilize your Attachment 3 as a
19 measurement of the improvement in the reliability obtained
20 from the improved actions and modifications the Commission
21 has directed with respect to EFW reliability?

22 A (WITNESS CURRY) I certainly recognize the fact
23 that there are uncertainties in the numbers. It was a point
24 that I thought important enough to mention in my written
25 testimony. However, if I were asked to estimate the

1 system's unavailability at this time period, this would be
2 my point estimate, and I think it is a reasonable basis for
3 making comparisons between systems or among systems.

4 Q Mr. Wermiel, in your first piece of testimony in
5 response to Board Question 6, you concluded that the
6 proposed short-term modifications described in the TMI-1
7 restart SER will improve EFW system reliability to the point
8 where restart can be permitted. You also testified on
9 examination that the NRC staff does not have a quantitative
10 reliability goal for the EFW system. Is that still your
11 testimony?

12 A (WITNESS WERMIEL) Yes, it is.

13 Q Is at least one of the purposes, then, of your
14 portion of the testimony, supplemental testimony, to explain
15 why you feel justified previously and now in reaching your
16 conclusion the reliability of the EFW system for restart
17 without a quantitative reliability standard?

18 A (WITNESS WERMIEL) That is exactly right. I felt
19 and I believe other people felt there was some confusion on
20 parts of certain parties as to exactly what went into the
21 evolution of our thinking that drew us to that conclusion,
22 and that is what I attempted to do in my part of this
23 supplemental testimony.

24 Q Taking into account what you know about the other
25 pressurized water reactors that are operating and their

1 emergency feedwater systems, I would like each of you to
2 answer this question: In your judgment is there a special
3 circumstance with respect to TMI-1, either with respect to
4 the challenge rate to its EFW system or the likelihood that
5 it will fail such that it will be appropriate to apply a
6 different regulatory standard, i.e., a quantitative number
7 to the restart of this unit?

8 MS. WEISS: I am going to object to that, just to
9 the form. I think you have asked two questions in one. I
10 think the witness just answered they would have no
11 quantitative reliability criteria. You have assumed that he
12 can supply different ones.

13 MR. BAXTER: I am sorry. I phrased the question
14 inartfully. I will do it again.

15 BY MR. BAXTER: (Resuming)

16 Q Is there a special circumstance, in your judgment,
17 at TMI-1 with respect to either the challenge rate to the
18 EFW system or with respect to the likelihood that it will
19 fail, such that you think it is appropriate to apply a
20 regulatory standard here, i.e., any quantitative reliability
21 number, which you have testified you do not use for other
22 plants?

23 A (WITNESS CURRY) I am not sure that the question
24 as phrased is meaningful with respect to the numbers that we
25 are talking about. In terms of plant risk, while there is

1 no Commission numerical goal, plant risk being defined as
2 the probability of core damage, there perhaps is some
3 movement in that direction. The role of any particular
4 system in mitigating initiating events that lead to plant
5 risk or core damage should be considered in the light of
6 those overall Commission goals in terms of probabilities of
7 core damage.

8 The vendor or the particular utility does not
9 stand out in any way toward the ultimate goal. It would
10 apply equally to anybody.

11 A (WITNESS WERMIEL) I would like to answer that
12 question in two parts. I am not aware of anything peculiar
13 about TMI-1 that would cause it to have any more challenges
14 to its emergency feedwater system than any other plant. But
15 secondly, I do recognize this ICS dependency in the opening
16 of the flow control valves as somewhat unique and as
17 something that is different from the majority of operating
18 PWRs.

19 Other B&W plants, from what I understand, do have
20 a similar dependence, and I believe this is -- this is
21 peculiar, but I believe the analysis and the evaluation that
22 we have done supports our conclusion that even with this
23 dependence, we are still satisfied that the system at
24 restart can be reliably operated and will be available.

25 (Counsel for the Licensee conferring.)

1 Q We had earlier testimony that in your analysis of
2 the TMI-1 system, a dominant contributor to unavailability
3 is ICS failure which prevents the opening of both the EFV
4 flow control valves. Do you know mechanistically that this
5 in fact will occur or is this an assumed failure?

6 A (WITNESS CURRY) Who is the question addressed to?

7 Q Either.

8 A (WITNESS CURRY) My assumption -- I have not done
9 an analysis of the ICS. It is based strictly on the
10 conclusion in the B&W report submitted to the staff that
11 there was a common point of vulnerability in the ICS
12 actuation of the control valves.

13 A (WITNESS WERMIEL) I have been told by people at
14 NRC in the Instrumentation and Control Systems Branch who
15 are familiar with the failure modes and effects analysis for
16 the ICS NNI system that such a vulnerability does exist.

17 Q Is it your impression that B&W found that it
18 exists mechanistically or they simply assumed it in their
19 FMEA to study the consequences of it?

20 A (WITNESS WERMIEL) I do not know the details of
21 the FMEA and how this conclusion was drawn.

22 A (WITNESS CURRY) It is my impression, having
23 looked at other B&W reports, there was not always such a
24 common point of vulnerability identified.

25 Q Looking at other B&W reports?

1 A (WITNESS CURRY) B&W did analyses for a number of
2 plants, six similar emergency feedwater system analyses, and
3 in looking at the other emergency feedwater system analyses,
4 I do not recall such a single point vulnerability always
5 identified. So, if you are asking for impressions, it is
6 my impression that B&W found something or had some concrete
7 basis that there was such a single point vulnerability.

8 DR. JORDAN: At TMI?

9 MS. WEISS: At TMI?

10 WITNESS CURRY: At TMI-1, right.

11 BY MR. BAXTER: (Resuming)

12 Q Prior to restart is there going to be the
13 capability for operators manually to respond to such a
14 failure?

15 A (WITNESS CURRY) It is my understanding that there
16 will be.

17 A (WITNESS WERMIEL) Yes, yes, both from the control
18 room and, of course, locally at the valve itself.

19 Q Did the reliability of the ICS NNI power supply
20 play any role in your analysis, Mr. Curry, and if so, did
21 you consider recent improvements that have been made by
22 Licensee to that power supply?

23 A (WITNESS CURRY) Once again, I did not investigate
24 the ICS system, and my estimate of that contributor was
25 based largely on the single-point vulnerability identified.

1 Q I would like to understand a little bit about your
2 view as to the extent to which we should compare the
3 reliability analysis results which B&W obtained some time
4 ago and which you have presented now here on TMI-1 versus
5 those in NUREG-0635 and 0611 for Westinghouse and Combustion
6 Engineering plants.

7 There is a sentence common to both of those
8 reports which I can show you if you would like which says
9 time and personnel limitations imposed on this study
10 precluded a complete and extensive review of each EFWS
11 system.

12 Can either of you tell me how many people and how
13 much time was spent on those two studies?

14 A (WITNESS CURRY) All right. The initial
15 Westinghouse and CE studies were done in -- each plant study
16 was done in a period of days by a group composed of staff
17 members from what is now the Division of Systems Reliability
18 Research, from the Office of Nuclear Reactor Regulation, and
19 some utility representatives.

20 The purpose of that review again was in direct
21 response to TMI, the occurrence at TMI, and to assess
22 whether there were outstanding vulnerabilities in each of
23 the utilities' EFWS systems.

24 Now, in terms of what was done for the analysis
25 presented here, the number derived in my Attachment 3 for

1 the mid-1979 design was based on the review essentially of
2 myself of the B&W report submitted to the staff. Those B&W
3 reports for TMI as well as the other B&W plants were
4 submitted to the staff at the request of the staff to have
5 the utilities perform them.

6 My number is based on information in the report
7 submitted for TMI-1, essentially review of that information,
8 and an independent estimate of the system's availability.

9 Q The B&W analysis which was referenced in earlier
10 Licensee testimony reports that each utility with a B&W NSS
11 furnished plant-specific system drawings, electrical
12 schematic diagrams, operating tests and maintenance
13 procedures and technical specifications for the auxiliary
14 feedwater system and pertinent support systems from which
15 B&W extracted information necessary to prepare a detailed
16 EFW system description and from which a fault tree was
17 constructed for each utility based on the detailed system
18 description.

19 Did the staff do a comparable effort for the CE
20 and Westinghouse plants?

21 A (WITNESS CURRY) The staff effort for the CE and
22 Westinghouse plants was probably not to that level, as I
23 interpret those words.

24 Q You have in your testimony on page --

25 MR. BAXTER: Am I holding up the limited

1 appearances?

2 CHAIRMAN SMITH: How much longer do you have, Mr.
3 Baxter?

4 MR. BAXTER: It will be very short, I think.

5 CHAIRMAN SMITH: Whatever your preference is. It
6 is not very late.

7 MR. BAXTER: Okay.

8 BY MR. BAXTER: (Resuming)

9 Q In your comparison on pages 35 and 37 you only
10 compare TMI-1 to Westinghouse plants. How would TMI-1
11 compare with the Combustion Engineering plants? In
12 particular, were any of them in the high range?

13 A (WITNESS CURRY) Were any of the CE plants in the
14 high range?

15 Q That is correct.

16 A (WITNESS CURRY) If you will hold on for a moment,
17 let me check.

18 (Pause.)

19 CHAIRMAN SMITH: While Mr. Curry is checking, I
20 want to bring to Mr. Pollard's attention our ruling this
21 morning as to the tech specs might be questionable. I
22 understand that you are happy with the explanation, but I
23 wanted to point out to you that in the Order and Notice of
24 hearing by incorporation -- well, in Short-term Item I.A,
25 the Licensee is required to upgrade the timeliness and

1 reliability of the emergency feedwater system by performing
2 the items specified in enclosure 1 of the Licensee's June
3 28, 1979 letter.

4 Going to enclosure 1 of the letter, there is a
5 requirement number 4 or a commitment that there will be an
6 incorporation of EFW auxiliary feedwater in TMI-1 technical
7 specifications as specified in I&E Bulletin 59-05A, Item 8
8 and verification that the technical specification
9 requirements of EFW capacity are in accordance with the
10 accident analysis and will be conducted, more than usual
11 bringing into the scope of the hearing and the Board's
12 purview the actual technical specifications, I believe.

13 MS. WEISS: Thank you for drawing that to your
14 attention.

15 CHAIRMAN SMITH: Are you ready with your answer?

16 WITNESS CURRY: Yes.

17 While depending on the transient, and since you
18 quoted the high range, only in transient 3, which is the
19 station blackout transient, are there any CE plants in the
20 high range.

21 BY MR. BAXTER: (Resuming)

22 Q Are the Westinghouse plants that appear in the
23 high range in your figures for the most part four-loop
24 plants?

25 A (WITNESS CURRY) I am not sure that I can make the

1 statement that for the most part they are four-loop. I
2 think the characteristics that tend to make them as a group
3 in the high range are the fact that they are automatically
4 initiated and there is significant separation among the
5 trains of the systems.

6 Mr. Wermiel informs me that most of them are
7 four-loop.

8 Q I think we understand from your testimony what the
9 purpose of these various reliability studies were, that is,
10 for comparison purposes between plants and to identify major
11 contributors to unavailability. In fact, there is a
12 statement in both NUREG-0635 and 0611 which I would like you
13 to react to in terms of whether you agree with it or not
14 that the results should be viewed in terms of the general
15 conclusions and insights and not as an absolute reliability
16 analysis of generic or plant-specific EFW systems upon which
17 the acceptability of these EFW system designs may be judged.

18 A (WITNESS CURRY) I would agree that the
19 acceptability of a design should not be based exclusively on
20 its numerical estimate of reliability.

21 Q Is that at least one of the reasons why the
22 numbers were not printed with 0611 and 0635?

23 A (WITNESS CURRY) Well, the reasons the numbers
24 were not printed in those two NUREGs is due to the
25 uncertainties associated with them in some respects. But to

1 answer your question: yes.

2 (Counsel for the Licensee conferring.)

3 MR. BAXTER: That is all I have for now.

4 CHAIRMAN SMITH: Is Dr. James Spang present? Dr.
5 Spang. Is Mr. Don Hossler present?

6 You both are scheduled for about 5 o'clock. Do
7 either of you prefer to wait or go forward? Does either of
8 you have a time problem?

9 MR. SPANG: I have somewhat of a time problem. I
10 have an appointment for 7 o'clock this evening.

11 CHAIRMAN SMITH: We are ready right now to receive
12 your statement. Just between you, I wondered who had a time
13 problem.

14 Why don't you proceed, Dr. Spang. Could you take
15 a microphone. The one right in front of you works all right.

16 Dr. Spang, do you have a written copy of your
17 remarks?

18 MR. SPANG: I do.

19 CHAIRMAN SMITH: Do you have an extra copy?

20 MR. SPANG: I do.

21 CHAIRMAN SMITH: It is very helpful if the
22 reporter has your written statement as you read it.

23 Mr. Hossler, do you have an extra written copy of
24 your statement?

25 MR. HOSSLER: No, I don't.

1 MR. SPANG: Shall I proceed?

2 CHAIRMAN SMITH: Yes, sir.

3 LIMITED APPEARANCE STATEMENT OF DR. JAMES B. SPANG
4 AMERICAN SOCIETY OF UTILITY INVESTORS

5 MR. SPANG: Mr. Chairman, members of the Board, my
6 name is James B. Spang. I am here today representing the
7 American Society of Utility Investors. The Society is a
8 Pennsylvania nonprofit corporation organized for the purpose
9 of advocating the interests of utility investors. Our
10 membership currently stands at 3,422.

11 The Society had initially planned to address the
12 Board at the second meeting scheduled for the William Penn
13 Museum. Since that meeting was not held, we are pleased to
14 have the opportunity to make our views known to you at this
15 time.

16 The questions before you these past few months
17 have been whether TMI-1 (a) meets current safety standards,
18 (b) can be safely operated in conjunction with the ongoing
19 cleanup of TMI-2, and (c) whether Met Ed has the financial
20 resources to safely operate the reactor, and by financial
21 resources I mean personnel.

22 Your decision, of course, is of the utmost
23 importance to the continued confidence of the investor and
24 the financing pattern of investor-owned utilities. We
25 believe that Met Ed has already shown that TMI-1 meets

1 current safety standards, that it can be safely operated in
2 conjunction with the cleanup of TMI-2, and that Met Ed does
3 have the financial and human resources to safely operate the
4 reactor.

5 However, since this is a highly technical subject
6 requiring expert judgment and questions of fact, the Society
7 will not presume to second guess this Board, the utility and
8 the expert witnesses. Instead, we would like to take this
9 opportunity to address the equally important question of the
10 context in which the technical questions are framed, namely,
11 what decision is in the best long-term interest of the rate
12 payers, the community and the nation. To answer this
13 question, we will need to briefly review the history of
14 nuclear power, its relative safety and its cost-benefit
15 ratio.

16 The age of atomic energy really began with the
17 dropping of the bomb on Nagasaki and Hiroshima in the
18 closing days of World War II. It not only brought that war
19 to a timely end, but scientists and energy-producing
20 practitioners everywhere soon looked upon the phenomenon as
21 the key to unlocking a world of unlimited energy abundance
22 for all mankind.

23 It only remained for a combination of government
24 and industry leaders working together to develop the
25 scientific and engineering knowledge for practical energy

1 applications. Progress in the field, however, was not
2 without its critics. From the beginning, serious questions
3 were raised regarding the safety and morality of using a
4 source of energy that could conceivably destroy whole
5 populations, if not all civilization.

6 Even those who favored the continued development
7 of nuclear energy worked hard to reduce the potential threat
8 of nuclear war through the introduction of veils of secrecy
9 and nonproliferation agreements. Meanwhile, the Atomic
10 Energy Commission led the field in developing and promoting
11 the peaceful use of atomic power.

12 Its activities were crowned in part with the
13 passage and subsequent extension of the Price-Anderson Act
14 in 1957, which limited liability for commercial users to
15 \$560 million. Language in the Act made it clear that the
16 Federal Government would accept responsibility for
17 protecting the public and utility companies in the unlikely
18 event of an accident.

19 On March 28, 1979, the unlikely event happened.
20 The area surrounding TMI witnessed three days of severe
21 uncertainty regarding the status and the danger of a reactor
22 failure. The reactor met the test. The fuel core was
23 safely contained and the emergency passed without any
24 material damage to offsite property or health.
25 Psychological stress, however, was immediately apparent, and

1 the critics of nuclear energy wasted little time in
2 capitalizing on the opportunity.

3 Corporations were chartered, committees were
4 formed, rallies were held and funds were raised to stop
5 forever the further development of nuclear energy.
6 Tremendous pressure was exerted on the politicians and the
7 regulatory agencies to proceed with initiatives that would
8 bankrupt the company, close TMI and signal the industry that
9 the nuclear option was dead.

10 Still the factual remains: Are nuclear reactors
11 safe, and if not absolutely safe, are they as safe or safer
12 than any other currently acceptable energy source? We
13 believe that they are, at least in relation to coal.

14 In terms of general safety to the population, an
15 article appearing in the Harrisburg Patriot on April 23,
16 1980 reviews a recent Federal Environmental Protection
17 Agency study. The article quoted the study as finding that
18 emissions from coal-fired plants present a greater
19 radioactive air pollution hazard to large populations than
20 emissions from any other manmade source.

21 It further notes that the study shows that the
22 population of a suburban community situated near a new 1100
23 megawatt coal plant incorporating the newest pollution
24 control technology is subject to a 20 times greater risk of
25 developing a fatal cancer than if the facility were an 1100

1 megawatt nuclear generating station.

2 Even if we were to discount the immediate health
3 threat to unsuspecting populations, we cannot ignore the
4 safety of miners, the tens of thousands of cases of miners'
5 asthma and 4000 deaths each year directly attributable to
6 black lung disease, in addition to innumerable mining
7 accidents. So much for coal.

8 More recently, Bernard J. Snyder, reporting for
9 the staff of the NRC in presenting the final report on the
10 environmental impact of TMI, noted that the total dose of
11 radiation received by the entire population within a 50-mile
12 radius of TMI would be a tiny fraction of the radioactive
13 dose in the natural environment, an amount Mr. Snyder called
14 totally insignificant.

15 Nevertheless, if we could all agree that the
16 radiation danger to the surrounding population of a normally
17 operating reactor is almost nonexistent, the question still
18 remains: is there or was there any real danger to the
19 community surrounding TMI after the accident?

20 Once again, the answer is no. Commonwealth Edison
21 has extensively advertised the fact that even the much
22 touted hydrogen bubble could not explode because there was
23 not nor could there be any oxygen. That fact never made
24 headlines. Indeed, on May 1, 1979 the NRC admitted the
25 scare was all a mistake.

1 Roger Matson, Director of its Systems Safety
2 Division, told a congressional committee that there never
3 was any danger of a hydrogen explosion in that bubble.

4 Commonwealth Edison further reports that even if
5 the fuel core had melted, it would not have spelled
6 disaster, for a number of reasons. First of all, the fuel
7 core in the reactor vessel was surrounded by a containment
8 building, not just any building, an immense fortress with an
9 enormously thick floor, 11 feet of solid concrete reinforced
10 with steel.

11 Second, for a molten mass to eat through it, that
12 concrete and steel floor could not be covered with water.
13 That water is what is used to cool the core. And when the
14 relief valve on the pressurizer stuck open sending several
15 hundred gallons shooting out, the law of gravity gave it
16 only one place to go, down to the floor right under the
17 reactor vessel, right in the path a molten mass would take.
18 That is the fallacy of the meltdown theory.

19 As for any sudden burst of steam pressure that
20 might be released when the molten mass hits the water, it
21 would not be nearly powerful enough to rupture the walls of
22 the building, walls capable of withstanding almost twice as
23 much force. In other words, there was no way for
24 significant radioactivity to reach the outside atmosphere.

25 In summary, if these accounts are even half true,

1 the chances of any harm to the community are almost
2 nonexistent. The concept of safety therefore is more
3 psychological than it is real.

4 Now, let's turn for a moment to the
5 cost-benefits. The Intelligence Journal carried an
6 interview on March 5, 1981 in which Congressman Robert S.
7 Walker is quoted as saying: "Nobody who has testified before
8 our task force and in Congress could see a scenario in which
9 the economics of TMI could be worked out without a reopening
10 of Unit 1. I think it vitally important that we get on with
11 the cleanup there."

12 In speaking of bankruptcy, Congressman Allen
13 Ertel's March report to his constituents states: "Quite
14 simply, bankruptcy is not a solution. The underlying
15 financial quagmire will remain regardless of who owns the
16 plant. In fact, bankruptcy would add litigation and other
17 administrative costs to the already huge price of cleanup
18 and would threaten to interrupt service to Met Ed's
19 customers." In other words, bankruptcy could worsen the
20 situation and does not hold any solutions.

21 In the same vein, the March 29, 1981 issue of the
22 Harrisburg Sunday Patriot quotes PUC Chairman Susan Shanaman
23 as saying: "I think only a minor percentage of people are
24 stilling calling for bankruptcy because they view it as a
25 means of punishment for the utility, but who will be

1 punished is the ratepayer."

2 In closing, let me add that the Reagan
3 Administration is solidly committed to nuclear power for
4 good reason. In their estimation, America cannot continue
5 to keep pace with the world community without nuclear power,
6 and they do not want to see America weakened by an
7 impossible demand for a totally risk-free society.

8 In relation to risk, Admiral Hyman Rickover, in an
9 address to the Annual Convention of the International
10 Platform Association in Washington, D.C. on August 1, 1979
11 notes that one of the most widely distorted risks is
12 radiation. He states that the word "radiation" has come to
13 connote danger. It is often described as so dangerous that
14 any amount is unsafe, and the question worth addressing is
15 how fast will radiation harm you.

16 Because you cannot see, feel, taste, hear or smell
17 radiation, it has an aura of mystery, but this same aura of
18 mystery appears to be absent from other potentially
19 hazardous things for which we have a lack of sensory
20 perception, such as radio waves, carbon monoxide or small
21 concentrations of numerous cancer-causing substances.

22 "In radiation as in other areas," Admiral
23 Rickover continues, "a most effective way to frighten people
24 is to state that no one knows what the effects of low level
25 radiation are. By the same token," he points out, "no one

1 knows what the effects are of smoking a few cigarettes or,
2 for that matter, our exposure to carbon monoxide on the way
3 to this hearing."

4 The point is that the effects, if any, are
5 extremely small. What we should be emphasizing is how much
6 we do know about these small actual effects. The Society
7 submits that the above examples and discussion clearly
8 represent the context from which the questions before you
9 stem.

10 In view of the above considerations, the Society
11 calls for the restart of TMI-1 for the following reasons.
12 One, the half-dozen similar reactors to TMI are currently
13 operating in the United States. Two, TMI-1 has been
14 functionally separated from TMI-2. Three, substantial
15 savings would accrue to GPU ratepayers through reduction in
16 the cost of energy.

17 Four, restart would help to reestablish the badly
18 tarnished image of the Federal Government as a responsible
19 partner in the promotion of commercial nuclear power. Five,
20 restart would be a signal to the financial community that
21 the Federal Government is committed to advancing the nuclear
22 option. Six, restart would give official recognition to the
23 fact that commercial nuclear reactors have been and continue
24 to be safe.

25 Finally, let me add that among all the things the

1 Federal Government might do to aid GPU, the most important
2 is simply to approve the restart of TMI-1. Anything less is
3 unconscionable, in our judgment.

4 Thank you.

5 CHAIRMAN SMITH: Thank you.

6 MR. SPANG: I have additional copies here if you
7 would like some.

8 CHAIRMAN SMITH: Yes. You are free to pass them
9 out to the parties present. This is actually bound into the
10 transcript of today's hearing. I mean this is actually read
11 into the transcript just as if you are testifying. It is
12 not evidence, of course, you realize.

13 MR. SPANG: That is correct.

14 MR. CUTCHIN: Mr. Chairman, before we move to the
15 next statement, are these witnesses going to be heard
16 further this afternoon or may they get up and move around?

17 CHAIRMAN SMITH: Mr. Pollard, it looks like there
18 is going to be very little, if any, time for anything
19 further. I know you are eager to get back. I think we
20 should allow just a few minutes for very important
21 cross-examination if you have it.

22 (Counsel for UCS conferring.)

23 CHAIRMAN SMITH: In any event, you gentlemen can
24 get up and walk around if you wish, or take a break.

25 Mr. Hossler.

1 LIMITED APPEARANCE STATEMENT OF DONALD HOSSLER

2 MR. HOSSLER: There are several things that I
3 would like to talk about regarding the TMI-1 hearings;
4 however, I sort of have broken them into three different
5 areas. One is a response to the NRC staff's recent attempt
6 to create what I would call a frenzied atmosphere of
7 brownout fever to the local citizenry, two, a review of
8 capacity figures to show that electrical generation is
9 available in the area, and three, several issues related to
10 the psychological well-being of area residents living near
11 TMI.

12 Before I get into what I want to start off with, I
13 want you to know that I realize that maintenance of
14 electrical generation equipment is necessary. It may take 5
15 to 12 years to build a power plant. Unplanned outages can
16 occur and power plants must come on-line to replace those
17 that are retired.

18 As we all know, GPU is a member of the PJM
19 Interconnect, and NUREG-0689 states that without TMI in
20 service, the PJM would experience no problem in at least the
21 next two years. Senate Report 96-14, July 1980, states that
22 without TMI-1 or 2 on line and no new capacity added, the
23 Pennsylvania-Jersey-Maryland Interconnect would have a
24 reserve margin of at least 25 percent until 1989. That is
25 on page 396.

1 The utility industry says reliable service implies
2 reserve margin of a certain amount above peak demand. The
3 PJM has a reserve margin requirement above peak set at 22
4 percent. GPU has a reserve margin requirement above peak
5 set at 24 percent. Estimates of PJM above peak for 1981 is
6 27 percent reserve margin, 1982, 27 percent reserve margin
7 without TMI-1 or 2 operating.

8 Also, using several documents I have been able to
9 uncover that GPU capacity is about 14 percent of the PJM
10 Interconnect and a lot of the information I get is coming
11 from a report put out by the Pennsylvania Public Utility
12 Commission, the Present and Future Electric Demand and
13 Capacity, July 1980.

14 What I did is I added up just some figures. I am
15 not a technician but I just found it very interesting, and I
16 found out that GPU's installed capacity for summer 1980 was
17 6,399 megawatts. The estimated peak demand for GPU summer
18 1980 was 6,153 megawatts. So basically you get a
19 theoretical GPU excess capacity of 246 megawatts for the
20 summer of 1980 without TMI-1 or 2 operating.

21 To take a different look at it, from 1981 until
22 1985, Met Ed without TMI-1 or 2 will average a shortfall of
23 384 megawatts below estimated peaks. In the same
24 time-frame, 1981 to 1985, Penelec will average a reserve of
25 189 megawatts over estimated peak demand.

1 The result through 1985 is a combined Met Ed and
2 Penelec shortfall of about 195 megawatts below peak demand
3 each year without TMI-1 or 2. I did not include Jersey
4 Central Power and Light because I could not get ahold of
5 their statistics.

6 But what I found amazing was simply that there was
7 a theoretical excess. Of course, if some are off-line for
8 maintenance, you do not know the excess. There was an
9 excess in summer of 1980 looking at just Met Ed and Penelec.

10 Now let's see what type of replacement power is
11 available to GPU now and in the future. Keeping in mind and
12 estimated Met Ed-Penelec shortfall each year, 1981-85 of 195
13 megawatts below peak, GPU presently has contracts for 200
14 megawatts from Ontario Hydro, 200 megawatts from PP&L, and
15 40 megawatts from Jamestown-York.
16 Also, 1000 megawatts is available from systems west of
17 here. Also, direct current intertie under Lake Erie by
18 Ontario Hydro is expected to be completed by 1985 and should
19 have about 1000 megawatts available.

20 Also, GPU proposed conservation and management
21 program is expected to reduce Met Ed peak load by 300
22 megawatts by the year 2000. In February of 1981,
23 negotiations for 254 more megawatts of coal power from
24 Ontario Hydro were being conducted by GPU. It appears there
25 is plenty and will be plenty of replacement power available

1 to GPU now and through the 1980s, it seems to me, without
2 TMI-1 while the company concentrates on the decontamination
3 at TMI-2.

4 The problem, of course, is the cost of replacement
5 power, as I see it. It looks to me like Jersey Central
6 Power and Light is the real problem for GPU because it is 66
7 percent oil and gas fired, 25 percent nuclear and 8 percent
8 coal. That 25 percent nuclear is one power plant, Oyster
9 Creek, which will be down in August 1981 because large leaks
10 must be repaired.

11 Also, Oyster Creek was out in January 5, 1980 to
12 July 19, 1980. The New Jersey Public Advocate Commission
13 study found management weak in tackling problems with
14 relatively unsophisticated planning methods. Another point
15 is that major additions to Penelec's capacity are
16 anticipated for 1987 and then 1994. Major deletions to
17 capacity for Penelec are 1994 and then in 1998. For Met Ed,
18 first major additions to capacity are slated for 1991 and
19 major deletions to capacity are slated for 1994.

20 These additions do not reflect anything from
21 Susquehanna, the Susquehanna Nuclear Power Plant. And of
22 course I realize that the financial circumstances might mean
23 that the utility cannot build any further energy generation.
24 But I am simply making the case here, basically, that power
25 is available outside of the system.

1 Another interesting statistic from the Senate
2 report 96-14, July 1980 speculates on GPU's summer of 1980
3 energy requirements with TMI-1 and 2 on line summer of
4 1980. Met Ed would have 50 percent excess over peak
5 demand. Penelec would have 35 percent excess over peak
6 demand. Jersey Central Power and Light would have 2-1/2
7 percent excess over peak demand.

8 The GPU system would have a 20 percent excess over
9 peak demand with TMI-1 and 2 operation in the summer of
10 1980. Information I have seen indicates a 15 to 20 percent
11 excess reserve over peak is adequate.

12 Several facts I would like to leave you with are
13 that Pennsylvania used .4 percent less total electricity in
14 1980 than in 1979. PP&L from January 1977 through January
15 1981 experienced a 1.8 percent growth in electric use. In
16 1981, PP&L is expected to have 42 percent reserve above peak
17 demand. If Susquehanna 1 and 2 go on line, PP&L would have
18 an estimated 60 percent excess capacity over peak demand.

19 Ten percent of the world's oil goes to generate
20 electricity. That oil is generally bottom of the barrel oil
21 that would wreck your car engine or your furnace. In 1979
22 oil-fired kilowatt hours were down 18 percent -- that is
23 300,000 barrels of oil a day -- even though nuclear output
24 was down 8 percent. West Penn Power Company in Pennsylvania
25 is all coal and hydro and has the lowest electric bills to

1 consumers in the state. ,

2 When the NRC staff raised a question about
3 brownouts several weeks ago, I immediately wrote a letter to
4 Mr. Richard Wiener, Director, Division of Power Supply at
5 DOE, and just some things I would like to share with you. I
6 realize that the media can take information and print what
7 they want, but I think that the DOE did us a disservice by
8 not specifying when the brownouts were and how severe they
9 were.

10 I got that clarification from Mr. Wiener, and what
11 I found out was that the brownout conditions occurred on
12 July 21, 1980 and September 2, 1980. The conditions existed
13 for approximately four hours on July 21 and five hours on
14 September 2. Voltage reduction and customer load appeals
15 were accomplished in the eastern areas of the PJM.

16 I believe the point is clear that there is an
17 excess of power; however, replacement power costs must be
18 dealt with, however possibly in another forum.

19 CHAIRMAN SMITH: Mr. Hossler, are you aware that
20 that information from the Department of Energy was submitted
21 by the NRC staff with respect to the need for --

22 MR. HOSSLER: Expedited hearings?

23 CHAIRMAN SMITH: The need for low power testing.
24 And that was referred to the Commission, and now the
25 Commission has already ruled on that point, and it is

1 totally outside our jurisdiction entirely. There is nothing
2 in our Notice of Hearing which allows us to look at need for
3 power in our hearing. I thought you might appreciate that
4 information.

5 MR. HOSSLER: I appreciate that; and I think that
6 a lot of the comments I make are very similar to what Mr.
7 Spang has made, but I appreciate that.

8 I believe here that the emphasis should be on
9 applying GPU and Met Ed's ability to concentrate on
10 decontaminating Number 2 and not operating Number 1 while it
11 is being decontaminated. Can the NRC expect the TMI area
12 population, already overly traumatized by commercial nuclear
13 power, have confidence in the utility's ability to operate a
14 plant and decontaminate a plant, as well as the NRC's
15 ability to regulate?

16 The Lessons Learned from TMI are always espoused
17 as being helpful to the nuclear industry and the NRC. In
18 the Washington Post on February 11, there was an article
19 about the NRC's study which showed a clear failure of Met Ed
20 to collect, analyze and release information about what was
21 going on in the plant. The NRC study said that there was no
22 system in Met Ed for gathering and evaluating all the
23 information that everyone had.

24 Morris Udall's committee also released a report
25 which found Met Ed officials were "presenting state and

1 federal officials with misleading statements that conveyed
2 the impression that the accident was substantially less
3 severe and the situation more under control than what the
4 managers themselves believed and what was in fact the case."

5 Udall expressed concern in a letter to the NRC
6 that the report does not provide adequate support for its
7 conclusions. Victor Stello of the NRC characterized the
8 management attitude of Met Ed as hesitancy about casting
9 things in the worst light, especially if you really thought
10 that things were just about to get better, but said that the
11 management did not lie.

12

18

19

20

21

22

23

24

25

1 The NRC report also said that much potentially
2 frightening information, including high temperature readings
3 and the sudden burst of pressure in the containment
4 building, indicated serious problems that were outside the
5 operator's training and experience. As a result, they were
6 written off as a faulty instrument measurement.

7 The Udall report said that the TMI plant managers
8 were aware of information indicative of a situation much
9 more perilous than was reported to state and federal
10 officials.

11 Another problem occurred at Indian Point which I
12 think reflects on how the area population views the NRC's
13 control of things since the TMI accident and thereby
14 instills in them certain ideas about how that plant would be
15 run if the NRC Commissioners vote to allow it to reopen.

16 Indian Point was shut down since October 17, 1980
17 when 100,000 gallons of water leaked into the containment.
18 It has been determined that tests must be conducted to
19 ascertain whether the water caused thermal stress weakening
20 the reactor vessel. On October 17, Con Ed told the NRC of
21 the flooding, said nothing of 50 workers exposed to
22 radiation.

23 On October 20, Con Ed restarted the plant without
24 detailed safety checks and decided there was possible
25 reactor damage. On October 28, the Con Ed PR chief admitted

1 that Con Ed executives did not tell him of the accident
2 until October 21. The New York Times on December 27
3 reported that NRC transcripts showed that the stationing of
4 technical advisers of the plant which resulted from the
5 Lessons Learned at TMI was ineffective.

6 Furthermore it showed that a regional section
7 chief for the Commission found Con Ed employees' actions
8 comic when they looked at the diminished flow of the pumps
9 and thought that the leaks had diminished.

10 In discussions leading up to the ratification of
11 Mr. Victor Stello's proposal to the Commission, Commissioner
12 John Ahearne asked what the shift technical adviser was
13 doing amid the confusion. This is a technical person
14 assigned to nuclear power plants following the Three Mile
15 Island accident.

16 Mr. Ahearne asked was he analyzing the stuff.
17 Thomas Martin, the Commission's regional section chief, said
18 no, sir, he was not. "The shift technical adviser is
19 stationed but not really trained. They have a lot of nitty
20 gritty of the plant to learn. They are using the system
21 descriptions," which are out of date, by the way.

22 Moving to the issue of evacuation, which I believe
23 you will be looking at very soon, I would like to say that
24 the Middletown area has done an outstanding job of preparing
25 for an evacuation for all emergencies. You can look at

1 evacuation or you can look at sheltering. To my mind it
2 does not matter.

3 I think there is a difference in evacuating people
4 in St. Louis, Missouri and evacuating people in Middletown,
5 and what I mean is at the first instance of a problem, even
6 though the ruling is going to be sheltering or evacuation, I
7 will go to the school, I will pick up my children, I will
8 take the quickest and most direct route to get out of the
9 town because I feel that I cannot trust the utility nor the
10 NRC because of what I went through and have been going
11 through because of the accident.

12 I think it is very difficult to instill in me very
13 much confidence that the information coming out of there
14 will be accurate, whether it is the news media's fault, the
15 state's fault, the NRC's fault, the utility's fault. If you
16 are going to shelter people, I do not think it will work. I
17 think they will leave anyway.

18 I think if you have evacuation routes, I think
19 that is great that they are set up. I do not think they are
20 going to work. People are going to go to the schools, they
21 are going to get their children. If they are 15 miles from
22 home, they will go home and get their families. They will
23 do that. They will not meet them in Wilkes Barre or
24 anywhere else.

25 I guess perhaps some of us should take the

1 description of what Herman Dieckamp of GPU suggested as was
2 printed in the York newspaper on June 19, 1979, in the York
3 Daily Record where he said, "If a given individual finds
4 reopening of TMI-1 unacceptable, then he has the freedom to
5 move, to change something."

6 I also found out that the Jersey Central Power and
7 Light, which is part of GPU -- and I know you are not
8 studying that but once again I think the whole thing comes
9 down to the fact that you need to gain the confidence of the
10 people -- Jersey Central Power and Light is part of the GPU
11 group, and it appears that a management study was recently
12 done which says that the management of GPU contributed to a
13 prolonged shutdown last year that cost about \$50 million
14 more than expected, according to an outside investigation
15 done by Greg Miner and Dale Bridenbaugh.

16 The outage began January 5, 1980 and was scheduled
17 to last 10 weeks, but inspectors found reactor safety
18 defects. The time needed for extra repairs, coupled with
19 unanticipated problems, prolonged the outage until July 19.
20 However, management was depicted in this study as weak in
21 tackling these problems.

22 This was compounded by relatively unsophisticated
23 planning methods that lag far behind these of other
24 utilities, the report said. For much of the life of Cyster
25 Creek, which started in 1970, it was an above average

1 record. However, since 1977 this record has deteriorated.

2 People boast about TMI-1's record since 1974, and
3 I think there are some comparisons here to make with Cyster
4 Creek. Four or five weeks have been set aside beginning
5 April 1981 for the installation of devices intended to
6 prevent an accident like the one at Three Mile Island. For
7 about six months this fall, the difficult task of replacing
8 the cracked cooling pipes --

9 CHAIRMAN SMITH: Mr. Hossler, I think our reporter
10 -- you are speaking very, very rapidly, and I am not sure he
11 is getting it all. Could you slow down your pace a little
12 bit?

13 MR. HOSSLER: Sure.

14 For about six months this fall, the difficult task
15 of replacing the cracked cooling pipes, core spray spargers
16 with an altogether new system will have to be done. A
17 six-month shutdown could cause repairs upwards of \$70
18 million in substitute power expenses. The company has
19 repeatedly underestimated -- this is from the report, now --
20 "the company has repeatedly underestimated the problems with
21 the core spray sparger," and this continues.

22 Another newspaper article, February 11, 1981,
23 indicates that a spokesman for Jersey Central Power and
24 Light said there is no public danger posed by the estimated
25 ten gallons of water that is believed to have leaked through

1 a wall of three feet of concrete into the soil. The ten
2 gallons seeped outside when 25 gallons of waste water
3 spilled onto a floor within the radiation waste treatment
4 plant, the NRC said.

5 The NRC spokesman said -- I am sorry, the Oyster
6 Creek spokesman said the room was "designed to be
7 leak-proof" but would have to be modified. The rad waste
8 facility which opened in 1978 is about 100 yards north of
9 the reactor.

10 Another example --

11 CHAIRMAN SMITH: Mr. Hossler, could I inquire, how
12 much more do you have?

13 MR. HOSSLER: About five minutes.

14 CHAIRMAN SMITH: You are eroding the time that we
15 hoped to complete cross examination of this panel. The
16 Union of Concerned Scientists will not be able to return. We
17 hoped to have some time left for them to do it.

18 MR. HOSSLER: I will cut through it. Okay.

19 CHAIRMAN SMITH: If you could summarize, we are
20 quite familiar with much of the material that you have
21 already given us.

22 MR. HOSSLER: Okay, fine.

23 I would like to turn to a letter which the NRC is
24 getting on turning TMI-1 on, and I would just like to point
25 out in the letter it points out that 58 percent of those in

1 cities near TMI have favored restart. I would like to just
2 add that I have a poll that was done at the Hershey Medical
3 Center that indicates that 60 percent of those living within
4 five miles would like it closed.

5 There have been several studies which I want to
6 just share with you here. A study done by Cynthia Flynn at
7 the University of Kansas showed that 50 percent of those
8 surveyed living within a five-mile radius of TMI stated the
9 disadvantages of TMI outweighed its advantages.

10 Peter Houtz of the Hershey Medical Center said 60
11 percent of those living within five miles of TMI opposed its
12 reopening. The Middletown Press and Journal did a survey
13 that found over 60 percent are opposed to the restart of
14 TMI-1. Oraltown Borough, which is about one mile from TMI,
15 found out that 50 percent of the people were in favor of a
16 conversion of the plant. Lower Swatara Township did a
17 survey. They are located three miles from the plant. They
18 found out 64 percent of the respondents did not want TMI as
19 a nuclear facility.

20 Senator George Geekis of Pennsylvania did a
21 newspaper poll and found out that 63 percent of those
22 responding did not want TMI open as a nuclear facility.
23 Swatara Township did a poll. That is five miles from TMI.
24 They found out that 64 percent of the people did not want
25 TMI reopened as a nuclear facility.

1 Local governments, High Spire Borough, four miles
2 from TMI, voted in 1979 to permanently shut down TMI as a
3 nuclear facility. Mechanicsburg Borough councilmen, 14
4 miles from TMI, voted a permanent shutdown of TMI as a
5 nuclear facility. Lower Swatara Township, three miles from
6 TMI --

7 CHAIRMAN SMITH: Mr. Hossler, are you aware that
8 another member of the public has given us the same
9 information, has come in here and read the same list of
10 informal polls and resolutions? Maybe it is not identically
11 the same, but many of them I identify as being the same.

12 What I suggest that you might want to do is to be
13 assured that we do have them and have them accurately, why
14 don't you reduce it to writing and give it to us or mail it
15 to us and we will most assuredly read it and make sure it is
16 a part of the public record, if that will be helpful to you.

17 MR. HOSSLER: Perhaps I could give it to the
18 reporter, okay, before I leave.

19 CHAIRMAN SMITH: All right, you can do that. We
20 will do it just that way if you want to. That would be
21 quite convenient.

22 MR. HOSSLER: Then finally I would just like to
23 say I reviewed a letter of February 13, 1981 from E.C.
24 Arnold of the utility to John Ahearne of the Commission, and
25 in that letter he talks about milestones for the restart,

1 possible restart, and he also talks about different things
2 which should be done. And I notice in here he says things
3 like no additional prerestart requirements as a result of
4 the ASLB decision, no delay due to FEMA certification of
5 state and local emergency plans.

6 He goes on with several things here that he feels
7 the utility should do to speed up what he feels is going to
8 be a restart.

9 I would just like to tell the three judges that I
10 believe the people in this area really deserve more than the
11 treatment of this plant as any other B&W reactor in the
12 country. We have had an accident here. It is a continuing
13 accident. And I would hope that this kind of documentation
14 which is being sent to you, which basically says things like
15 overlook this or overlook that --

16 CHAIRMAN SMITH: That document, incidentally, was
17 sent directly to the Commission, and the Commission, as I
18 indicated before, has ruled and has decided not to accept
19 the recommendations made in that document.

20 MR. HOSSLER: Okay, fine.

21 In that case I would just like to say that in your
22 recommendations to the Commission this summer, I would hope
23 that you treat this as a unique operating reactor and not as
24 other B&W reactors. I really believe that we deserve all
25 the operators being 100 percent certified, 100 percent

1 certification, no variances, no things like that. I think we
2 deserve that. I think if something should happen, if you
3 should suggest a restart to the Commissioners, I think it
4 would not shed a good light on the ASLS for the hearings.

5 With that, I will conclude.

6 I have several questions that I was going to
7 direct to you about limited appearances and in what form you
8 are going to send your recommendations to the Commission. I
9 would like to briefly say that I would hope whatever is
10 written out of your determinations and the NRC
11 Commissioners, that it could be written in such a form that
12 people would understand what the contentions were and what
13 the decision was and why it was made in such a manner,
14 because I find it very difficult in digging through a lot of
15 this information, and I would hope that you could make it
16 easier for a lot of us to understand why you decided what
17 you decided.

18 CHAIRMAN SMITH: Well, we certainly hope we can do
19 that, and we will try.

20 MR. HOSSLER: Thank you.

21 CHAIRMAN SMITH: Thank you very much, Mr.
22 Hossler. You have on several occasions written and called
23 and have given us quite helpful suggestions on limited
24 appearance statements. You are going to give a portion of
25 your statement to the reporter

1 Now, would you like to have a brief
2 cross-examination?

3 MS. WEISS: I think I may have just one short line
4 of questions.

5 CHAIRMAN SMITH: I thought we could bind this into
6 the transcript. What I will do is tomorrow I will read the
7 parts into the transcript that you did not get to, and I am
8 sorry I interrupted because I see you were almost completed
9 with that list of resolutions and polls. In fact, let's do
10 it right now.

11 The only one you did not get to was Marietta
12 Borough; is that correct?

13 MR. HOSSLER: Yes.

14 CHAIRMAN SMITH: Marietta Borough, 9/20/79,
15 permanent shutdown of TMI as a nuclear facility.

16 The next one, Columbia Borough, 9/21/79, permanent
17 closing of TMI as a nuclear facility.

18 Lower Paxton Township, October 16, 1979, kept
19 closed unless or until more comprehensive, stringent and
20 fail-safe methods of operating the plant are developed.

21 Now I think that your statement is probably
22 complete, then, Mr. Hossler; is that correct?

23 MR. HOSSLER: No. I did not hear Middletown
24 Borough.

25 CHAIRMAN SMITH: Middletown. You had had Swatara

1 Township. Middletown Borough, July 2, 1979 adopted several
2 items. The major one was nuclear exclusions must be removed
3 from all insurance policies before TMI-1 is reactivated as a
4 nuclear facility.

5 Okay. When I had asked that you put it in written
6 form, I was not aware it was substantially complete;
7 otherwise, I would have allowed you to complete it. Do you
8 think we have it now?

9 MR. HOSSLER: Yes. Could you bind it in with --

10 CHAIRMAN SMITH: I do not think it will fit into
11 the transcript very well. That is the problem. I do not
12 think we can do it. It will not work. You review it. If
13 you think we left something out, you write it and we will
14 put it in. We cannot reliably promise you that this will
15 end up in the transcript in the form that you have submitted
16 it.

17 MR. HOSSLER: Send it to you?

18 CHAIRMAN SMITH: Yes, sir. You better take this
19 back, then.

20 MR. HOSSLER: I have a copy.

21 CHAIRMAN SMITH: Do you? Okay. Yes, if you think
22 there was something left out, you send it in.

23 MR. HOSSLER: When can I review the transcript?

24 CHAIRMAN SMITH: At the public document room.

25 Mr. Hossler, do you understand that we have

1 intervenors who are carrying a very heavy burden in trying
2 to present a position against the utility? They are waiting
3 to cross examine these witnesses after you get done with
4 your business, and they cannot return and we are intruding
5 upon their time.

6 MR. HOSSLER: Sure.

7 CHAIRMAN SMITH: I mean these people --

8 MR. HOSSLER: I waited too. I was there March 5.

9 CHAIRMAN SMITH: Do you understand that they have
10 an interest almost identical to yours?

11 MR. HOSSLER: Thank you.

12 CHAIRMAN SMITH: Sure.

13 Ms. Weiss.

14 BY MS. WEISS: (Resuming)

15 Q There was some discussion in Mr. Baxter's
16 cross-examination about NUREGs 0611 and 0635, the staff
17 reviews of the Combustion Engineering and Westinghouse
18 plants and staff's review of the B&W analysis of its own
19 plants.

20 Can you just tell me what conclusions the staff
21 reached upon consideration of all those studies after they
22 were completed with respect to the relative reliability of
23 B&W emergency feedwater systems and/or the relative number
24 of challenges to emergency feedwater systems among and
25 between the vendors?

1 A (WITNESS CURRY) Well, the reports are issued for
2 a particular vendor. The staff, with respect to your
3 question about challenges to each system, there is an
4 additional NUREG, which is NUREG-0560, I believe, which
5 discusses the staff's conclusions about feedwater transients
6 in terms of the conclusions about the relative reliabilities
7 of B&W systems.

8 The results that I presented today are being
9 prepared for inclusion in a NUREG which presents the results
10 of the staff's review of the B&W-submitted analyses of six
11 or seven auxiliary feedwater system designs. That NUREG is
12 not finished yet and there is no one particular document
13 that compares them vendor by vendor.

 That is what I tried to make an attempt to do in
15 my testimony.

16 Q I understand that there is not any such document,
17 but didn't the staff take actions with respect to B&W that
18 were guided by your feeling about the relative number of
19 challenges to EFW and/or the relative reliability of EFW
20 between and among the various vendors?

21 A (WITNESS WERMIEL) I am not sure what actions you
22 are referring to. All the recommendations or criteria that
23 I have identified in my testimony have been applied to all
24 plants.

25 Q When were the B&W plants shut down?

1 A (WITNESS WERMIEL) They were shut down right after
2 the TMI-2 accident, but I do not recall the exact date.

3 Q I think it was some months after.

4 A (WITNESS WERMIEL) I do not recall exactly when.

5 Q Do you remember what precipitated that?

6 A (WITNESS WERMIEL) No, I do not specifically.

7 Q And none of the other -- the Combustion
8 Engineering plants or the Westinghouse plants were shut down.

9 A (WITNESS WERMIEL) No, not that I am aware of.

10 (Counsel for UCS conferring.)

11 MS. WEISS: I have no further questions. Thank
12 you.

13 CHAIRMAN SMITH: Is there anything further this
14 evening? If there is nothing further this evening, we will
15 adjourn until 9:00 a.m.

16 (Whereupon, at 6:00 p.m. the hearing was
17 adjourned, to reconvene at 9:00 a.m. the following day,
18 Thursday, April 2, 1981.)

NUCLEAR REGULATORY COMMISSION

This is to certify that the attached proceedings before the

in the matter of: METROPOLITAN EDISON COMPANY (TMI Unit 1)

Date of Proceeding: April 1, 1981

Docket Number: 50-289 (Restart)

Place of Proceeding: Harrisburg, Pa.

were held as herein appears, and that this is the original transcript thereof for the file of the Commission.

David S. Parker

Official Reporter (Typed)
