Washington, D.C.

Dear Sir

Rather than vent the Three-Mile-Islands load of radio-krypton into the atmosphere, why not vent it into a cryogenics systems, or, better a tank containing liquid helium, to condense out the radio-active gases. Or absorb them on molecular sieve. In either case the radio-active material can then be buried.

In future, all vent systems should pass through a cryogenics scrub.

I hope you will acknowledge this letter. (I also wonder why our President, a chemical engineer, didnt think of this.)

Yours faithfully

POOR ORIGINAL
