

DIRECT TESTIMONY OF

DR. J. D. GUY

ON BEHALF OF HOUSTON LIGHTING & POWER COMPANY

RE ENERGY ALTERNATIVES

8012300 675

DIRECT TESTIMONY OF  
DR. J. D. GUY  
RE ENERGY ALTERNATIVES

1 Q. Please state your name and position.

2 A. My name is J. D. Guy and I am employed as Manager  
3 of Corporate Planning at Houston Lighting & Power Company  
4 (HL&P).

5 Q. Please describe your educational background.

6 A. I have B.S. and Ph.D. degrees from Texas A & M  
7 University and an M.S. degree from the University of New  
8 Mexico in Electrical Engineering. Additionally, I have  
9 taken a number of undergraduate and graduate level courses  
10 in economics, finance, and accounting at the University of  
11 Houston.

12 Q. Please describe your work experience following  
13 graduation from college.

14 A. Following graduation from Texas A & M, I worked  
15 for four years at HL&P in the Engineering Department; leaving  
16 HL&P in 1974, I worked at the Atomic Energy Commission as a  
17 Power Systems Engineer until 1976. For the past four years,  
18 I have been employed by Houston Lighting & Power Company in  
19 the Corporate Planning Department and was promoted to Manager  
20 of Corporate Planning in February, 1980. In this capacity,  
21 I am responsible for developing HL&P's long range corporate  
22 plans.

23 Q. What is the purpose of your testimony?  
24

1           A.    First, I will update the Allens Creek Environmental  
2 Report Supplement with respect to HL&P's demand forecast and  
3 the planned capacity additions necessary to meet the pro-  
4 jected load. I will explain how the Allens Creek project  
5 fits into the Company's plans for future generation addi-  
6 tions. I will explain that we are precluded from construct-  
7 ing new gas or oil fired generating facilities and that,  
8 therefore, our only alternatives are to construct new nuclear,  
9 coal, and lignite plants. In addressing the contentions on  
10 conservation and alternative energy sources, I will be  
11 joined by a panel of witnesses who have addressed various  
12 parts of the contentions. Dr. Anderson will provide an  
13 independent analysis of future demand for electricity on  
14 HL&P's system. Dr. Perl will explain that the various con-  
15 servation measures recommended by the intervenors cannot  
16 eliminate the need for the Allens Creek project. In the  
17 process of that analysis, he considers the energy conserva-  
18 tion measures suggested by TexPirg and demonstrates that  
19 rather than reducing the need for Allens Creek, these con-  
20 servation measures would increase the need for the project  
21 because they would increase the need for base load capacity  
22 on HL&P's system. Dr. Perl also compares the costs of the  
23 coal, lignite, gas, and nuclear alternatives and establishes  
24 that among these alternatives, nuclear power is the least

1 expensive source of electricity. Dr. Hamilton will address  
2 the comparative health effects of coal, lignite, and nuclear  
3 plants. Dr. Woodson will testify that it is not feasible to  
4 replace the capacity of Allens Creek with a plant that is  
5 fueled by the burning of solid waste. Mr. Simmons will  
6 testify that the construction of interconnections with  
7 neighboring utilities does not present a possibility of  
8 reducing reserve margins and thus obviating the need for the  
9 Allens Creek project.

10 Q. Please describe the Company's current demand and  
11 capacity forecast.

12 A. The Allens Creek Environmental Report Supplement  
13 filed in May, 1978, contains a thorough description of  
14 HL&P's method of forecasting demand. Figure S.1.1-3 in the  
15 Supplement shows the actual capability and peak demand data  
16 from 1963 through 1976 and forecasted data for 1977 through  
17 1987. I have attached hereto as Applicant Exhibit No. \_\_\_\_\_  
18 (JDG-1), a table showing the actual peak demand for 1977  
19 through 1980 and the forecasted peak demand for 1981 through  
20 1991, and the reserve margins in each year.

21 Q. Has the Company changed its scheduled generation  
22 additions shown at page SH-100 of the ER Supplement?

23 A. Our planned generation additions are developed on  
24 a continuing basis. The schedule shown at page SH-100 has

1 changed several times since publication of the ER Supplement.  
2 The most current schedule is shown on Applicant Exhibit No.  
3 \_\_\_\_\_ (JDG-2) which lists the new plants presently being  
4 planned or under construction, the estimated unit capability,  
5 the fuel type and the scheduled in-service date of each  
6 plant.

7 Q. Does this construction program provide HL&P with  
8 sufficient capability to maintain adequate reserves through  
9 1988?

10 A. No. HL&P has had to enter into contracts to  
11 purchase capacity from neighboring utilities in order to  
12 meet its reserve requirements. These agreements include:  
13 (1) a contract between HL&P and the City of Austin to pur-  
14 chase 500 megawatts of capacity in 1980 and 800 megawatts  
15 from 1981 through 1987; and (2) a contract between HL&P and  
16 the City Public Service Board of San Antonio to purchase  
17 from 200 megawatts to 500 megawatts between 1982 and 1987.  
18 Exhibit JDG-1 shows the effect of these purchases on HL&P's  
19 reserves. A summary of the purchased power presently under  
20 contract is shown in Applicant Exhibit No. \_\_\_\_\_ (JDG-3).

21 Q. What is the current schedule for Allens Creek?

22 A. Allens Creek is now scheduled to be in commercial  
23 operation in 1988, but after the peak of that year. That is  
24 why I have shown it coming on line in 1989 in Applicant  
Exhibit No. \_\_\_\_\_ (JDG-2).

1 Q. What is the impact on reserve margins if Allens  
2 Creek is delayed?

3 A. If we are unable to bring the Allens Creek project  
4 on line in 1989, our reserve margin would drop to 9.3 per-  
5 cent. The reserve margin would be 10.7 percent in 1990 if  
6 Allens Creek is not in operation by then.

7 Q. Is it possible to cover this shortfall in reserves  
8 through additional capacity purchases?

9 A. While we have been able to cover some of our short  
10 fall in reserves through purchases from other companies, the  
11 reserve margins shown in Exhibit JDG-1 are dependent upon  
12 Allens Creek coming on line before the peak season in 1989.  
13 It is possible that we can continue to make up for some of  
14 the shortage in reserves through capacity purchases if  
15 Allens Creek is delayed to 1990 or beyond. However, 1990  
16 may be an extremely critical year, because most of the  
17 excess capacity which we have been able to purchase is  
18 either oil or gas-fired capacity that is being displaced by  
19 cheaper base load coal units. Much of this excess capacity  
20 may not be available for sale due to either the unavailabil-  
21 ity of fuel and/or the legal prohibitions on its use.  
22 Secondly, by 1990, projected load growth in the systems  
23 supplying the capacity will have eroded the excess capacity  
24 to the extent that these systems are no longer willing to

1 make commitments of firm capacity sales. For instance, as  
2 shown in the July, 1980, National Electric Reliability  
3 Council report, the installed reserve margin of ERCOT is  
4 expected to fall from 46 percent in 1979 to 19 percent in  
5 1990.

6 Q. Is there a cost penalty associated with delaying  
7 Allens Creek in reliance upon capacity purchases from other  
8 electric utilities?

9 A. Yes. There is a tremendous penalty both in terms  
10 of escalation and replacement fuel costs. The plant costs  
11 will escalate by about \$100,000,000 each year that it is  
12 delayed and the differential fuel costs would average at  
13 least \$500,000,000 each year, based on present cost estimates  
14 of replacement fuels. So, if Allens Creek were delayed only  
15 one year to 1990, there would be a cost penalty of about  
16 \$600,000,000. I reiterate that by 1990, the excess gas and  
17 oil capacity previously available for purchase will largely  
18 disappear so we cannot continue to defer Allens Creek in  
19 reliance upon such excess capacity.

20 Q. Would you please explain why HL&P cannot construct  
21 new generating capacity to be fueled by natural gas or fuel  
22 oil?

23 A. In 1978, Congress passed the Powerplant and In-  
24 dustrial Fuel Use Act, 42 U.S.C. §8301 et seq. This Act

1 prohibits HL&P from constructing new power plants that use  
2 either petroleum or natural gas as a primary energy source.  
3 The Act also provides that natural gas will not be used as a  
4 primary energy source in any existing power plant after  
5 January 1, 1990.

6 Q. Are you familiar with the exemptions permitted  
7 under the Act?

8 A. Yes, I am very familiar with them. In fact, I  
9 first became involved with this legislation when it was  
10 proposed in the Spring of 1977. At that time HL&P began an  
11 intensive effort to review and comment on the proposed  
12 legislation. Subsequent to the passage of the Act I was  
13 involved in our review of and commenting on the DOE regula-  
14 tions implementing the Act. Most importantly, it has been  
15 my continuing responsibility to evaluate the Act as it  
16 affects HL&P's corporate planning.

17 Q. Would you please explain the exemptions available  
18 under the Fuel Use Act and what their impact is on HL&P?

19 A. There are a number of exemptions available under  
20 the Act which may allow, under certain showings on the part  
21 of HL&P, either construction of new oil or gas-fired facil-  
22 ities or continued use of natural gas in existing facilities  
23 past January 1, 1990. I have reviewed those exemptions for  
24 construction of new facilities and have concluded that there

1 is no certainty that HL&P could meet the requirements for  
2 any exemption except the peak load exemption. However, this  
3 exemption would allow only 1500 hours of use of the exempted  
4 facilities and would hardly provide sufficient energy to  
5 replace that expected to be available from Allens Creek.

6 Of the exemptions available under the Act for extended  
7 use of natural gas in existing facilities, the only two for  
8 which HL&P may be able to qualify are the retirement and  
9 synthetic fuel exemptions. The retirement exemption may  
10 allow an additional five years of natural gas use provided  
11 that HL&P pledges to retire the exempted capacity at the end  
12 of the five year period. The synthetic fuel exemption may  
13 allow up to ten years of natural gas use if HL&P can make  
14 the necessary showing that synthetic gas will be available  
15 and used at the end of the exemption period. HL&P's current  
16 plans anticipate the use of both these exemptions in order  
17 to realize the maximum economic utilization of its existing  
18 gas-fired generating capability.

19 Q. Would the utilization of these exemptions affect  
20 the need for Allens Creek?

21 A. No, because the contemplated exemptions only pro-  
22 vide for extended use of existing facilities, the expected  
23 growth in system demand must be supplied by additional new  
24 capacity. The new capacity will consist of coal, lignite,

1 and nuclear units, including Allens Creek, which is an  
2 important and integral part of HL&P's planned generation  
3 mix.

4 Q. Please explain why there is no reasonable prob-  
5 ability that HL&P could get a permanent exemption to con-  
6 struct a new base load, gas-fired plant.

7 A. In order to qualify for such an exemption, HL&P  
8 must show, in effect, that it cannot construct new coal,  
9 lignite, or nuclear plants. Since we are planning for and  
10 constructing all three of these types of plants it would  
11 seem impossible to make the showing required for the perma-  
12 nent exemption for a new base load, gas-fired plant.

13 Q. What about the provision that indicates that there  
14 may be an exemption to avoid violation of environmental  
15 requirements such as the Clean Air Act?

16 A. Obviously, we are planning and constructing new  
17 coal and lignite plants both inside and outside our service  
18 area. As long as we have the capability to find sites where  
19 we can construct new coal or lignite plants in compliance  
20 with the Clean Air Act, we simply cannot qualify for this  
21 exemption.

22 Q. In the FES Supplement the NRC Staff cites a study  
23 by the Federal Power Commission which indicates that the  
24

1 rate of development of natural gas supplies will be inade-  
2 quate to meet current projections of demand. In its order  
3 of November 13, 1980, the Board asked whether there was more  
4 recent information than that provided in the FES Supplement  
5 on cost and availability of natural gas. Can you address  
6 the Board's question?

7 A. With respect to the question of costs, I defer to  
8 Dr. Perl. On the question of availability, I am not aware  
9 of any studies which would serve as a basis to reverse the  
10 conclusion drawn by the NRC Staff in Section S.9.1.2.1 of  
11 the Final Supplement to the Final Environment Statement  
12 (FSFES).

13 Q. Are you aware of any studies which provide more  
14 recent support for the conclusions in the FSFES?

15 A. In May, 1979, the Department of Energy published a  
16 study known as National Energy Plan II, which is a compre-  
17 hensive study of U.S. energy problems. This study was  
18 prepared by DOE in accordance with Section 801 of the Depart-  
19 ment of Energy Organization Act. In NEP II, the DOE  
20 addresses the future supply and demand for natural gas and  
21 concludes that there is extreme uncertainty as to whether  
22 natural gas supply can satisfy U.S. demand through the year  
23 2000. This prediction includes all sources of supply -  
24

1 conventional and unconventional, domestic and imported.  
2 Another comprehensive study was published by the National  
3 Research Council in 1979. The title of this study is "Energy  
4 in Transition 1985-2010." This study was prepared for the  
5 Department of Energy under a contract initially entered into  
6 by the Energy Research and Development Administration. The  
7 Council's report contains a number of scenarios for natural  
8 gas production through 2010. Under even the most optimistic  
9 scenario they expect continued declines in both oil and gas  
10 production through 2010. The report states that "the likeli-  
11 hood of reversing the slow decline in domestic oil and  
12 natural gas production is quite small, and the prospect of  
13 compensating for this decline by continued growth of oil  
14 imports is equally small, at least beyond a few years in the  
15 future." Finally, in a report prepared by the Department of  
16 Energy in November, 1980, titled "Reducing U.S. Oil Vulner-  
17 ability, Energy Policy for the 1980's," the Department  
18 concluded that it is "highly unlikely that the production of  
19 [natural] gas can increase or even be held constant over the  
20 next 20 years."

21 Q. The November 13 order also raises a question as to  
22 the environmental comparison between natural gas plants and  
23 nuclear plants. Has HL&P done any such comparison?  
24

1           A.    We have not done a specific comparison; however, I  
2 am sure that natural gas plants would compare very favorably  
3 to nuclear plants. Gas fired plants are clearly preferable  
4 to coal and lignite because the sulfur and ash discharges  
5 are negligible. Likewise, there is a very minimal impact  
6 associated with the fuel cycle for gas plants. However, any  
7 environmental comparison is meaningless because we cannot  
8 build new gas fired plants. The gas fired plant is just not  
9 an option for us.

10           Q.    Exhibit JDG-2 shows that HL&P is planning and  
11 constructing nuclear, coal, and lignite plants. As Manager  
12 of Corporate Planning, is it your view that the Company  
13 should construct all three types of plants?

14           A.    Yes, it is.

15           Q.    From your perspective as a corporate planner why  
16 is it desirable to have a diversity of generating plants on  
17 the HL&P system?

18           A.    There are numerous reasons, but it basically comes  
19 down to the fact that it is highly desirable to have a  
20 diversity of fuel supply. The point is illustrated by our  
21 experience. Up until the 1970's, we were totally dependent  
22 upon natural gas for our fuel supply. As a result of short-  
23 ages of natural gas that developed in the early 1970's and  
24 the resultant legislative and regulatory prohibitions on the

1 had been planned. The only short term remedy was to install  
2 fuel oil capability in our generating plants. The price of  
3 fuel oil has, of course, skyrocketed in the past few years  
4 and the Federal government has passed laws and regulations  
5 designed to discourage further dependence on imported oil.  
6 For the longer range, we also undertook an ambitious nuclear  
7 program. Like all other companies in the United States, we  
8 began experiencing substantial delays in our nuclear plants,  
9 which caused us to focus on coal plants as an alternative.  
10 We found that we could undertake construction and operation  
11 of coal plants on a shorter schedule than nuclear plants.  
12 This was an important consideration because of the tremen-  
13 dous load growth on HL&P's system and because of our in-  
14 ability to construct new gas-fired generating facilities.  
15 We are now turning our attention to lignite plants because  
16 the fuel supply is relatively closer to HL&P's service area  
17 and the cost projections for lignite fuel supply are much  
18 more stable than the cost projections for coal.

19 Q. What is the benefit of a nuclear plant in terms of  
20 adding diversity to HL&P's system?

21 A. First, the cost of power produced by a nuclear  
22 plant is competitive with power produced by a coal or lignite  
23 plant. Furthermore, a nuclear plant is not as vulnerable as  
24

1 a coal plant to escalations in fuel costs. The fuel costs  
2 associated with operation of a nuclear plant amount to about  
3 27 percent of the total electricity cost whereas the fuel  
4 costs of a coal plant amount to about 65 percent of the  
5 total electricity costs. Thus, escalations in fuel cost  
6 have less effect on total cost of power from a nuclear  
7 plant. Furthermore, the cost of western coal at the mine is  
8 usually subject to considerable escalation and there is a  
9 considerable risk of escalation in the cost of transporting  
10 coal. Indeed, the cost of transporting coal from the West  
11 (Wyoming and Montana) is much greater than the purchase  
12 price of the coal itself. For example, for the first nine  
13 months of 1980, the average price paid by HL&P for coal was  
14 \$10.60/ton, while the rail tariff averaged \$18.83/ton.  
15 These transportation costs reflect rates as they were prior  
16 to deregulation. The transportation costs following deregulation  
17 are likely to be an even greater portion of the total.  
18 We hope to get some protection from these transportation  
19 costs by building mine-mouth lignite plants in Texas.  
20 However, there is a limited supply of economically recoverable  
21 lignite deposits for which leases have been sufficiently  
22 consolidated to support all of the new power plants which  
23 must be built in Texas in the next few years to supply the  
24 expected increases in electric demand.

1 Q. Does that complete your testimony?

2 A. Yes.
