P R O C E E D I N G S

1
2 MS. WEISS: I made a proposal to the parties
3 yesterday, and we discussed it again this morning and have
4 agreement on changing the order of some of the scheduled
5 items. What I proposed and what was agreed to is that we
6 proceed through completion of Item 3, emergency feedwater
7 reliability, through Item 4, safety system bypass and
8 override, and through UCS 12, which is the environmental
9 qualification Contention, which is part of Item 5, and the
10 Board questions on UCS 12. At that point -- and at that
11 point proceed to some additional testimony which the
12 licensee intends to file this week, responding to some more
13 questions that were raised by the Board on emergency
14 feedwater. They intend to file that. Our plan is to do
15 that at that point, at that point to break from the UCS
16 Contentions, and we have estimated that that would take us
17 probably through the middle of next week and perhaps through
18 the end of next week, at that point, to break at whatever
19 point that is and to go down to Contentions in which UCS is
20 not directly involved, beginning with Item 8, integrated
21 control system, Item 10, containment isolation; Item 11,
22 computer; and Item 13, instrument ranges, to give UCS the
23 time when those Contentions were being heard here to go back
24 and prepare for the rest of the Contentions on which it is
25 directly involved.

1 Now, Licensee has said that it has no problem
2 accommodating that schedule with staff. It knows that some
3 of its witnesses are available for some of those issues. It
4 does not yet know if all of them are available for all of
5 those issues. Generally, I think that nobody has any
6 objection to proceeding in that way.

7 CHAIRMAN SMITH: I see. You are the most
8 affected, Mr. Sholly.

9 MR. SHOLLY: No problem.

10 CHAIRMAN SMITH: So staff witness availability
11 will be the controlling consideration.

12 MS. WEISS: I should tell the Board that I have
13 talked with ECNP and they have no objection.

14 MR. BAXTER: I should note for the Board that ECNP
15 is the designated lead Intervenor on Items 11 and 13, which
16 are two of the four we just identified.

17 CHAIRMAN SMITH: On Items what?

18 MR. BAXTER: 11 and 13.

19 CHAIRMAN SMITH: Have you been working with ECNP
20 on these Contentions?

21 MR. SHOLLY: Not very much at this point. We were
22 waiting to see where the schedule is going to fall in. We
23 should be getting together this evening, and we will work
24 more details out at that point.

25 CHAIRMAN SMITH: Okay. You do anticipate an

1 active role of Intervenor's on these issues, do you?

2 MR. SHOLLY: I do, yes.

3 CHAIRMAN SMITH: Okay.

4 MR. SHOLLY: We have been working separately on
5 what we would like to do in the way of cross examination.
6 It is a matter of getting together, who is going to do what.

7 CHAIRMAN SMITH: You at least have plans for
8 active participation. You just have not consolidated it.

9 MR. SHOLLY: Yes.

10 MR. BAXTER: Our main motivation, Mr. Chairman, in
11 agreeing to this schedule is it will not result in any loss
12 of hearing days or interruption in the ongoing process.
13 That is why the agreement of ECNP as represented by Ms.
14 Weiss and Mr. Sholly is important to us in reaching this
15 agreement, that we will not find ourselves short,
16 unprepared, and we will go forward.

17 CHAIRMAN SMITH: The way that that would affect us
18 is the first week in December --

19 MS. WEISS: It could -- I think it is conceivable
20 it could affect us by Tuesday of next week, but I think it
21 is more likely it won't affect us until the first week in
22 December, and I told ECNP that it could happen as early as --

23 CHAIRMAN SMITH: Were you able to work out
24 anything for the 24th?

25 MS. WEISS: No, we will be here. This proposal

1 that I have made --

2 CHAIRMAN SMITH: Gives you relief?

3 MS. WEISS: Yes. We can prepared for all of it up
4 to that point.

5 CHAIRMAN SMITH: Okay.

6 Mr. Sholly, if you would like to use the FTS
7 telephones that we have in our office to contact people at
8 ECNP to bring them into the consideration, you are welcome
9 to do that.

10 Do you understand?

11 MR. SHOLLY: Yes, sir.

12 CHAIRMAN SMITH: We can arrange that during
13 breaks, but you say you normally would be in touch with them
14 this evening anyway?

15 MR. SHOLLY: Yes.

16 CHAIRMAN SMITH: Okay.

17 (The Board conferred.)

18 CHAIRMAN SMITH: Let's go off the record and get
19 the sequence that has been recommended. I did not take
20 notes.

21 (Discussion off the record.

22 CHAIRMAN SMITH: Back on the record.

23 The Board has announced that we will be having
24 hearings on the 22nd, 23rd and the 24th. Is there anything
25 further before we begin with the witnesses?

1 All right, proceed.

2 One further comment. Dr. Little is on a hearing
3 in Illinois this week and we are proceeding under the quorum
4 rule. The reason for Dr. Little choosing the hearing in
5 Illinois compared to this one is that she is badly needed on
6 that one because it has a strong environmental
7 consideration, and this one, as we know, is hardware of that
8 nature.

9 Whereupon,

10 GARY R. CAPODANNO and LOUIS C. LANESE,
11 called as witnesses by counsel for Licensee, having
12 previously been duly sworn by the Chairman, resumed the
13 stand, were further examined and testified as follows:

14 CROSS EXAMINATION -- Resumed

15 BY MR. POLLARD:

16 Q Mr. Lanese, I would like to ask you one or two
17 questions on your testimony on Friday.

18 Could you please refer to transcript pages 5699
19 and 5700? There is a sentence beginning on line 2 of 5700
20 which reads, "Safety grade is a more narrow description of
21 the function of the clearance of the system."

22 Please review as much of the transcript as you
23 need, but I would like you to explain the meaning of that
24 sentence.

25 (The Witness reviewed the document.)

1 A (WITNESS LANESE) In reading the transcript, I
2 noted that appeared to be an error. The function of the
3 clearance I am sure was functional criteria of the system.

4 Q So the sentence would read, "Safety grade is a
5 more narrow description of the function of the criteria --

6 A (WITNESS LANESE) Functional criteria of the
7 system.

8 Q Is a more narrow description of the functional
9 criteria of the system.

10 A (WITNESS LANESE) That is right.

11 CHAIRMAN SMITH: Without objection, the Board will
12 order the correction in the transcript accordingly.

13 BY MR. POLLARD: (Resuming)

14 Q With those changes, could you please expand on the
15 meaning of that sentence, that safety grade being a more
16 narrow description of the functional criteria of the system
17 -- I am sorry, I don't know what you are getting at.

18 A (WITNESS LANESE) Safety grade system I think
19 would -- would require a consideration of applicable
20 regulatory guides on the standards, and where the GDC again
21 are very general, when you talk about a safety grade system
22 now, you are talking about how is that particular General
23 Design Criteria implemented, and how is it interpreted, and
24 the Reg Guides are the staff interpretation of the General
25 Design Criteria.

1 Q I would just like to read to you from the
2 introduction to Appendix A to Part 50 and ask you if you
3 agree with this. The introduction to Appendix A to 10 CFR
4 Part 50 -- that is on page 359 -- pursuant to the provisions
5 of Section 50.34, "An application for a construction permit
6 must include the principal design criteria for a proposed
7 facility. The principal design criteria establish the
8 necessary design, fabrication, construction, testing and
9 performance requirements for structures, systems and
10 components important to safety, that is, structures, systems
11 and components that provide reasonable assurance that the
12 facility can be operated without undue risk to the health
13 and safety of the public."

14 Do you agree with that paragraph and particularly
15 the emphasis on the phrase "components important to safety,"
16 or the phrase "important to safety"?

17 A (WITNESS LANESE) Yes, I do.

18 Q Thank you.

19 If we could return now to your testimony, your
20 response to Board Question 6G on page 7, do I understand
21 your testimony correctly, particularly beginning at the
22 third paragraph, that one emergency feedwater pump is
23 sufficient to mitigate a small break loss of coolant
24 accident, or a loss of main feedwater transient?

25 A (WITNESS LANESE) Yes, that is correct.

1 Q Would you please refer to Figure 1 of Licensee's
2 Exhibit 15.

3 Am I correct that the valves to the left of each
4 of the pumps labeled EFV 19A and B ands EFV 21 are what are
5 termed recirculation valves. I am sorry, I gave you the
6 wrong valve numbers, didn't I? I meant to refer to EFV 2A
7 and 2B ands 2C, I think. I cannot quite read -- I am
8 talking about the valves which are apparently controlled by
9 flow going through the pump, and it comes off the discharge
10 of the pump and recircs back to what is labeled a train to
11 the CST de-ice line. I cannot read the other figure.

12 A (WITNESS LANESE) Those are the EFV 8A, B, and C
13 valves, and those are pump recirculation lines.

14 Q Now, if I understand your testimony, in deciding
15 that one emergency feedwater pump is sufficient to mitigate
16 small break loss of coolant accidents and loss of main
17 feedwater transients, that you require a minimum flow of 500
18 gallons per minute, is that correct?

19 A (WITNESS LANESE) The minimum analyzed flow for
20 small break LOCA is 500 gpm.

21 Q My question is, if the recirculation valve for one
22 of the motor operated pumps, assuming that is the only pump
23 we have, if the recirculation valve is open, what is the
24 maximum flow capability from the pump being delivered to the
25 steam generators?

1 A (WITNESS LANESE) For the motor driven pumps it
2 would be less than 500 gpm.

3 Q Do you know how much?

4 A (WITNESS LANESE) The number I remember is on the
5 order of 70 or 80 gpm recirc flow.

6 Q So that I would assume that that is roughly 420 or
7 430 gallons per minute being delivered to the steam
8 generators.

9 A (WITNESS LANESE) Yes, that is right.

10 Q Would that amount of flow being delivered to the
11 steam generators change depending upon whether the flow was
12 going to one steam generator or two steam generators?

13 A (WITNESS LANESE) That is correct also.

14 Q It would change.

15 A (WITNESS LANESE) Yes.

16 Q It would be higher if you were delivering to two
17 steam generators?

18 A (WITNESS LANESE) Yes, it would.

19 Q Assuming we are delivering to two steam
20 generators, am I correct in that what you just said is the
21 flow from one motor driven pump with a recirculation valve
22 failed to open would be in the range of 420 to 430 gallons
23 per minute.

24 A (WITNESS LANESE) It would certainly be less than
25 500, and as I said, I think about 420 to 430.

1 Q And that if we were only delivering to one steam
2 generator, it would be even less than that value.

3 A (WITNESS LANESE) It should be somewhat less than
4 that, yes.

5 (Pause)

6 Q If I could refer you now to page 2 of Licensee
7 Exhibit 25 --

8 A (WITNESS LANESE) I should also clarify part of my
9 response. When I said 500 gpm, that is immediately
10 following -- 20 minutes after a LOCA, as the testimony
11 states, approximately 300 gpm if you have a prompt
12 initiation of emergency feedwater.

13 Q Yes.

14 Now, at the top of page 2 on Licensee Exhibit 15,
15 the first paragraph, it states that the control valve -- am
16 I correct, they are referring there to the recirculation
17 control valves -- that these control valves fail open on
18 loss of control air.

19 Is that correct?

20 MR. BAXTER: Excuse me. What line were you on?

21 MR. POLLARD: I am referring to, in general, the
22 first paragraph on page 2 at about the middle of the
23 paragraph. It states that the cxontrol valves fail open on
24 loss of control air. It is slightly after the middle of the
25 paragraph.

1 BY MR. POLLARD: (Resuming)

2 Q I have two questions.

3 First, are the control valves referred to in that
4 sentence the recirculation control valves? That is the
5 first question.

6 A (WITNESS LANESE) That is correct.

7 Q And is it correct that those control valves fail
8 open on loss of control air?

9 A (WITNESS LANESE) Yes, that is also correct.

10 Q And it will remain -- the design will remain in
11 that way at the time of restart.

12 (Pause.)

13 A (WITNESS LANESE) I am not positive, but I think
14 that is also true.

15 Q Is there something that you could consult that you
16 could be more positive about whether or not that is an
17 aspect of the design that will change prior to restart?

18 A (WITNESS LANESE) Nothing that I have with me, no.

19 Q But I am correct, in Section B of Licensee Exhibit
20 15, that is where you have enumerated the modifications that
21 will be made prior to restart.

22 (Pause)

23 A (WITNESS LANESE) Yes, that is true.

24 Q Perhaps on the next break you can attempt to
25 determine whether or not this aspect is going to be changed

1 prior to restart. We will go on for now.

2 Is it a design basis for Three Mile Island Unit 1
3 that you should be able to mitigate small break loss of
4 coolant accidents and loss of main feedwater transients with
5 one motor driven emergency feedwater pump?

6 A (WITNESS LANESE) No, it is not because that is
7 more than one single failure to get you to that point.

8 Q Is it a design basis accident for the steam line
9 to the turbine driven feedwater pump to fail or break or
10 rupture?

11 A (WITNESS LANESE) As an independent event, or
12 simultaneous with LOCA?

13 Q That would be the accident, a break of the steam
14 line to the emergency feedwater pump.

15 A (WITNESS LANESE) Yes.

16 Q Excuse me, I meant the emergency feedwater pump.

17 A (WITNESS LANESE) Yes, that is what I understood.

18 Q If that were an accident and the single failure
19 was a diesel generator failing to start, is it not correct
20 that you would, under those circumstances, have only one
21 motor driven pump remaining?

22 A (WITNESS LANESE) That is correct, but under those
23 circumstances you would not need as much emergency flow. In
24 fact, we have analyzed an event for Unit 2 with a higher
25 power level that demonstrates that for Unit 2 460 gpm is

1 more than adequate for that event.

2 Q Are there any small break loss of coolant
3 accidents or loss of main feedwater transients which are
4 within the design basis for Three Mile Island Unit 1 which
5 would require more than one motor driven emergency feedwater
6 pump to mitigate?

7 A (WITNESS LANESE) No.

8 DR. JORDAN: Was the answer no?

9 WITNESS LANESE: The answer was no.

10 (Pause)

11 BY MR. POLLARD: (Resuming)

12 Q If I refer you to a paragraph in your testimony
13 labeled Case 2 --

14 CHAIRMAN SMITH: What page?

15 MR. POLLARD: Page 8 of his direct testimony.

16 BY MR. POLLARD: (Resuming)

17 Q There is a paragraph labeled Case2. Am I correct
18 that your testimony states that B&W did an analysis assuming
19 emergency feedwater flow rate of 550 gallons per minute must
20 be supplied within 20 minutes, but that was for a higher
21 power level plant than Three Mile Island Unit 1.

22 A (WITNESS LANESE) That is right.

23 Q Do I understand your testimony that for Three Mile
24 Island Unit 1 you need a minimum of 500 gallons per minute?

25 A (WITNESS LANESE) We asked B&W to verify that 500

1 gpm would still be adequate, and they verified that 500 gpm
2 was adequate. That does not imply that lower flow rates
3 could not be demonstrated to be adequate.

4 Q Do you have any analysis to demonstrate that lower
5 flow rates are adequate?

6 A (WITNESS LANESE) No, we have not analyzed that
7 specifically.

8 Q Okay.

9 Now, is it your testimony that one motor driven
10 emergency feedwater pump can deliver 500 gallons per minute
11 regardless of whether it is delivering to both steam
12 generators simultaneously or only to one steam generator?

13 A (WITNESS LANESE) Delivery to one steam generator
14 would be less than 500 gpm.

15 Q But that one motor driven pump could deliver 500
16 gpm minimum to both steam generators.

17 A (WITNESS LANESE) That is correct.

18 Q Could we now go to your direct testimony in
19 response to Board Question 6I, and I see this was jointly
20 authored with Mr. Capodanno. The Board asked, "Will the
21 reliability of the emergency feedwater system be greatly
22 improved upon conversion to safety grade, and is it the
23 Licensee's and the Staff's position that the improvement is
24 enough such that the bleed and feed backup is not required?"

25 Your testimony begins with a sentence which

1 states, "The ability of the emergency feedwater system to
2 respond to anticipated transients and many other accidents
3 will not be substantially improved upon conversion to safety
4 grade since the principal deficiencies in the existing
5 emergency feedwater system are in the environmental
6 qualification of equipment for non-LOCA events."

7 After emergency feedwater is made safety grade,
8 will some equipment still not be environmentally qualified?

9 A (WITNESS LANESE) No, that is not true.

10 Q Perhaps you can explain to me, then, the first
11 sentence of your response which seems to say to me that
12 after conversion to safety grade, that is not going to make
13 a lot of difference because the principal deficiency is that
14 the equipment is not environmentally qualified. But now you
15 have told me after it is safety grade, all the equipment
16 will be environmentally qualified.

17 A (WITNESS LANESE) What I --

18 MR. BAXTER: What is the question?

19 BY MR. POLLARD: (Resuming)

20 Q Do you understand the source of my confusion?

21 A (WITNESS LANESE) Yes, I think I can explain
22 that. Since the major deficiencies would be in the ability
23 of the system to respond to high energy line breaks outside
24 containment, I did not believe there was a significant
25 improvement since those are low probability events. That

1 was my intention of saying while we were going to improve
2 the system response for those events, since they were not
3 high probability events, that in the overall plant
4 improvement to safety, that was not a significant
5 contributor.

6 Q That was very helpful.

7 Let me see if I understand now your testimony
8 which we covered either Friday or another day was that at
9 the time of restart, the emergency feedwater system will be
10 safety grade for small break loss of coolant accidents and
11 loss of main feedwater transients. Is that correct?

12 A (WITNESS LANESE) That is correct.

13 Q But it will not be safety grade for high energy
14 line breaks in the immediate building.

15 A (WITNESS LANESE) That is correct.

16 Q Could you -- just simply stated, the probability
17 of a high energy line break was low. Could you compare for
18 me the relative probability of a high energy line break
19 versus the probability of a small break loss of coolant
20 accident?

21 A (WITNESS LANESE) That is why I generally use the
22 term likelihood because it is certainly not a quantitative
23 assessment.

24 Q I understand that. What I would like to know, do
25 you have any opinion as to whether the small break loss of

1 coolant accident is more or less likely than a high energy
2 line break?

3 A (WITNESS LANESE) I think a small break loss of
4 coolant accident is more likely than a guillotine break of a
5 main feed or steam line in the intermediate building.

6 Q Is it -- by making that distinction of a
7 guillotine high energy line break, do you mean to say that
8 those are the only high energy line breaks?

9 A (WITNESS LANESE) No. I think we would -- we
10 would not have any environmental qualification problems with
11 the small breaks in the intermediate building. The
12 guillotine rupture is the one that results in higher
13 calculated temperatures than we had calculated before. I am
14 not saying that there is no environmental qualification in
15 the intermediate building.

16 Q So then your exact testimony was that for high
17 energy line break of the type involving a guillotine break
18 of a high energy line, that that is less probable than a
19 small break loss of coolant accident.

20 A (WITNESS LANESE) Yes, that is correct.

21 Q Can you tell me the basis for that judgment? In
22 other words, are there more stringent standards applied to
23 high energy lines than compared to the primary system?

24 A (WITNESS LANESE) No. I think it is based on some
25 judgment and also some experience in having seen some

1 probability analysis on pipe break, and also on crack
2 propagation. While I am not an expert in this, I have at
3 least seen summaries of such reports, and it is not very
4 likely that you would propagate a guillotine rupture in a
5 pipe in a very short period of time. That takes a
6 substantial period of time to -- it takes a substantial
7 period of time to create a guillotine rupture.

8 DR. JORDAN: Could I ask in considering the small
9 break loss of coolant accidents, were you factoring in a
10 failed PORV as being a major item contributing to the
11 probability of a break?

12 WITNESS LANESE: Well, certainly that is, as we
13 have seen, that does contribute to the likelihood of a small
14 break LOCA. On the other hand, in a strict legal sense,
15 that is not a break in the reactor coolant system. I did
16 intend to include the valve failures as a loss of coolant
17 from the reactor --

18 DR. JORDAN: I see. You did not really mean to
19 include the PORV.

20 WITNESS LANESE: I am considering that.

21 DR. JORDAN: I see. Okay. And so therefore,
22 considering PORV as part of the primary system, you feel
23 therefore the probability of a break which includes a
24 failure of the PORV in the primary system is more likely
25 than a break in the secondary system.

1 WITNESS LANESE: Well, I am including not only the
2 likelihood of the valve failing open, but leaks or cracks in
3 the primary coolant piping in general.

4 DR. JORDAN: And does this include failures in the
5 bearings of the reactor coolant pumps?

6 WITNESS LANESE: Yes, that is true.

7 DR. JORDAN: Thank you.

8 CHAIRMAN SMITH: Has there ever been a guillotine
9 break in the secondary system such as you describe, a fast
10 one that would have the effect that you referred to?

11 WITNESS LANESE: Never in the types of materials
12 that are used in commercial power plant piping today, now.

13 CHAIRMAN SMITH: Has there ever been a non-valve
14 LOCA in the primary?

15 WITNESS LANESE: I am sorry, could you repeat the
16 question?

17 CHAIRMAN SMITH: Has there ever been a non-valve
18 loss of coolant accident in the primary system in a nuclear
19 plant?

20 WITNESS LANESE: There have been seal leakages,
21 but there have never been any broken pipes that I am aware
22 of, reactor coolant pump seals.

23 DR. JORDAN: Wasn't there an instance of a failure
24 of the secondary system whereby steam valves -- steam safety
25 valves opened, and the result of the reaction forces tore

1 open the steam line itself?

2 WITNESS CAPODANNO: Yes, I believe that is
3 correct, and I think it occurred on the order of six or
4 seven years ago, possibly longer. I remember one instance
5 that occurred at Turkey Point Station, as I recall, and it
6 was as a result of thrust imbalance from a discharging main
7 steam relief valve causing a failure at the juncture between
8 the inlet pipe and the relief valve and the main steam
9 piping itself.

10 BY MR. POLLARD: (Resuming)

11 Q Are there any other accidents like a guillotine
12 high energy line break for which the emergency feedwater
13 system will not be safety grade prior to restart?

14 A (WITNESS LANESE) The only accident that it would
15 not be fully qualified for would be steam or feed line
16 breaks in the intermediate building.

17 Q And the reason it is not safety grade for those
18 accidents is that some of the equipment is not
19 environmentally qualified. Is that correct?

20 A (WITNESS LANESE) It is more correct to say that
21 we have not yet demonstrated whether they are qualified.

22 Q You have not demonstrated that either they are or
23 they are not?

24 A (WITNESS LANESE) That is correct.

25 Q So you just don't know?

1 A (WITNESS LANESE) We are still working on it, yes.

2 Q But it is your testimony, though, that it meets
3 all other safety grade requirements such as single failure
4 criterion for small break loss of coolant accidents and loss
5 of main feedwater transients?

6 A (WITNESS LANESE) That is correct.

7 Q Does it meet the single failure criterion with
8 respect to -- I will wait until later. I am sorry.

9 CHAIRMAN SMITH: Can you give us just a moment?

10 (Whereupon, a brief recess was taken.)

1 CHAIRMAN SMITH: Mr. Pollard, you may proceed

2 BY MR. POLLARD: (Resuming)

3 Q We are still on your answer to Board Question 6I.

4 Is it your position that the reliability of the
5 emergency feedwater system has been greatly improved as a
6 result of converting it to safety grade for small break loss
7 of coolant accidents and loss of main feedwater transients?

8 A (WITNESS LANESE) No, I would not characterize it
9 as greatly improved. I would characterize it as optimized.
10 There has been improvement.

11 Q Is it your position that the improvement in
12 reliability of the emergency feedwater system is sufficient
13 such that you need not rely upon the feed and bleed mode of
14 ECCS?

15 A (WITNESS LANESE) Yes.

16 Q Is that stated anywhere in your response to Board
17 Question 6I?

18 A (WITNESS LANESE) I think that was the implication^{*}
19 in the first paragraph when I said that the system at
20 restart will have redundancy, diversity, sufficient capacity
21 to supply RCS cooling under the single failure assumptions.

22 Q Could we move on to your response to Board
23 Question 6J?

24 In your testimony you used the word "reliability,"
25 and you say that the reliability of that system has been

1 demonstrated by ten manual emergency feedwater initiations
2 which exhibited no component failures, and by surveillance
3 testing of individual components which did not reveal
4 conditions in excess of allowable technical specification
5 limits.

6 My question is what do you mean by the word
7 "reliability" in that sense?

8 A (WITNESS CAPODANNO) In the sense that when the
9 system was tested, it ran and functioned at it should have.

10 Q What quantitatively -- what reliability is
11 demonstrated by ten manual initiations?

12 A (WITNESS CAPODANNO) I do not have a probabilistic
13 assessment, if that is what you are referring to. Again, I
14 think we used the term in the sense that one might apply to
15 even a piece of household equipment or personal automobile,
16 that when the thing was tried, it worked, rather than trying
17 to say that there was some absolute number that we could
18 quote.

19 Q It is your testimony that you conclude, though,
20 that the emergency feedwater system is sufficiently reliable
21 to permit restart of the plant, is that correct?

22 A (WITNESS CAPODANNO) That is correct.

23 Q How many of these successful manual initiations
24 would it take for you to be able to reach that conclusion?

25 A (WITNESS CAPODANNO) Again, as I stated, the term

1 as I used it there means in each instance where it was
2 tried, it worked. Consequently, the conclusion that it is
3 reliable.

4 Q Would you change your conclusion if you had tried
5 it only five times?

6 A (WITNESS CAPODANNO) I am sorry, more than five
7 times?

8 Q More than five times.

9 A (WITNESS CAPODANNO) No.

10 Q Would you change your conclusion if you had tried
11 it only once and it was successful?

12 A (WITNESS CAPODANNO) Again, in the context that we
13 use the term reliability, as it is tried each time and it is
14 demonstrated to work, it proves itself to be reliable. So
15 if it was done once or ten or fifty times, I would still
16 give you the same answer.

17 Q Let me try a different one. Suppose you tried it
18 ten times and one out of the ten times it failed; would that
19 change your conclusion?

20 A (WITNESS CAPODANNO) No, but again, you would have
21 to look at what the specific failure was. Generally I would
22 say no.

23 Q Generally you would say what?

24 A (WITNESS CAPODANNO) No.

25 Q No, that it would not change your conclusion?

1 A (WITNESS CAPODANNO) That is correct, it would not
2 change my conclusion.

3 Q Suppose it failed five out of the ten times that
4 you tried it?

5 MR. BAXTER: Objection, Mr. Chairman.

6 CHAIRMAN SMITH: I think you are near to running
7 the string out on this line of questioning. However,
8 proceed, but you know, bring it to a reasonable conclusion.

9 BY MR. POLLARD: (Resuming)

10 Q Would you change your conclusion if out of the ten
11 manual initiations it failed five times?

12 A (WITNESS CAPODANNO) I think yes. At some point
13 -- you know, that is not again an absolute, but at some time
14 you would make a judgment, a qualitative judgment that it
15 was not functioning as frequently and as thoroughly as you
16 would like.

17 Q So then, am I correct then in preparing your
18 testimony, you had no quantitative goal in mind as a basis
19 for your conclusion that the system is sufficiently reliable
20 to permit restart?

21 A (WITNESS CAPODANNO) That is correct, and if I
22 may, I would like to explain that a little bit. I think
23 that a quantitative goal by itself is a difficult thing to
24 deal with. What strikes me as more significant is that as
25 the system was tried, it worked. If I had a reliability

1 calculated or a reliability goal stated, I am not certain
2 what one does with an absolute number like that, whereas if
3 the system is tried and each time it works, it is
4 operational proof of its reliability.

5 Q I would like to now refer you to Table 1 in
6 Licensee Exhibit 15.

7 Can you explain to me please the footnote which
8 appears on the bottom of the first page of Table 1 which
9 reads, "Where noncompliance has been identified for a GDC,
10 it has not been repeated for instances where that
11 noncompliance would affect compliance to another GDC."

12 A (WITNESS CAPODANNO) What we are attempting to
13 identify with that note is the GDCs have some degree of
14 interrelationship, and I do not think in evaluating one it
15 was intended that you read it as automatically tied to the
16 others, but rather you look at the specifics of what each
17 GDC says.

18 So, as an example, if, speaking hypothetically for
19 the moment, if someone identified a system, says, that was
20 non-seismic Category 1, there might also be another GDC that
21 addresses perhaps pipe rupture. What we are saying is that
22 look, some of those things are obviously tied one to the
23 other, and it could get confusing if we kept repeating over
24 and over again the interrelations between the GDCs. So what
25 we try to do is address the specifics of the wording of the

1 GDC and give our comments.

2 Q So am I correct, then, that there may be other
3 GDCs which are not met which are not on this table?

4 A (WITNESS CAPODANNO) There are others that we felt
5 that did not have direct applicability to emergency
6 feedwater, and we did not list them.

7 Q My question was, does this footnote mean that
8 there are other GDCs that might not be met or are not met,
9 but those are not identified on this table?

10 A (WITNESS CAPODANNO) Again, I have trouble with
11 your terminology, "not met." What I am trying to indicate
12 to you is we feel other GDCs make reference to certain
13 requirements that do not apply to emergency feedwater, and
14 that is why they are not listed.

15 Q All right. Let me ask you specifically, then,
16 some of the GDCs which are not listed.

17 Oh, before we start that, this table reflects the
18 status of the emergency feedwater system at what point in
19 time, at the time of restart?

20 A (WITNESS CAPODANNO) Yes.

21 Q You have two columns there. One is labeled the
22 Restart System and one is labeled the Future System.

23 A (WITNESS CAPODANNO) Yes. That is intended to
24 identify what the condition would be under each.

25 Q At the time of restart, will the emergency

1 feedwater system meet General Design Criterion 1, which is
2 quality standards on the records?

3 CHAIRMAN SMITH: Does this portend what I think it
4 does?

5 MS. WEISS: Yes.

6 MR. BAXTER: Mr. Chairman, before the question is
7 posed as to whether this meets GDC 1, I believe it has to be
8 established in the Witness's mind whether this criterion is
9 applicable.

10 CHAIRMAN SMITH: Where are we now on the
11 testimony? He has already testified that he has eliminated
12 the criteria that he does not believe is applicable from the
13 table, and now the cross examination I would expect is going
14 to try to establish that he was mistaken in his judgment.

15 I mean, is that where we are going?

16 MR. BAXTER: Except the first question was whether
17 or not it meets General Design Criterion 1.

18 MR. POLLARD: I will be happy to ask if he
19 believes each is applicable to the emergency feedwater
20 system.

21 CHAIRMAN SMITH: Okay. I think there can be an
22 accommodation among parties on this.

23 MR. BAXTER: The problem is going to be I think
24 the Witness, as you stated, Mr. Chairman, he is probably
25 going to testify that they are not applicable, and the

1 question as to whether they are met seems to me to be
2 hypothetical at best, and I don't know what kind of reliable
3 evidence it will be for the record.

4 DR. JORDAN: I guess I had not realized, is it on
5 the record, and it is the Witness's testimony that the only
6 GDC criteria that are applicable to the emergency feedwater
7 system are the ones listed, starting with GDC 2. You
8 believe that none of the other criteria are applicable to
9 this system?

10 WITNESS CAPODANNO: No, I would not be that
11 absolute. What we are trying to identify is specifics of
12 system design as opposed to, say, General Quality Assurance
13 Program that is applied to the entire plant. Have I
14 mentioned we tried not to get so broad in scope that we
15 ended up discussing everything that exists in Part 50.

16 I think there are other areas that you can point
17 to where programs are in place to do the things identified,
18 but we were not trying to identify the entire quality
19 assurance program as a topic for discussion in this table.
20 What we are trying to say is there are specific GDCs that
21 relate to design, physical configuration that we thought
22 ought to be addressed. We identified those and gave our
23 comments on them.

24 DR. JORDAN: Are there any General Design Criteria
25 that might in part be applicable that the system does not

1 meet?

2 WITNESS CAPODANNO: I think this Criterion 1 and
3 the general reference of quality assurance has been applied
4 to the system already. So yes, in that context, yes.

5 DR. JORDAN: Yes, but my question was somewhat
6 broader. Are there General Design Criteria that you do not
7 meet with the design of the emergency feedwater system?
8 Have you looked them over to see, and are there some that
9 you do not meet?

10 WITNESS CAPODANNO: Again, there are ones we don't
11 meet because we felt they do not apply. Just glancing at
12 the book in front of me, there are criteria on reactor
13 design, Criterion 10, reactor design, addressing core and
14 associated controls and such.

15 DR. JORDAN: Okay. That is what I meant, though,
16 either they don't apply or you meet them, all of the General
17 Design Criteria.

18 WITNESS CAPODANNO: Yes, I think that is correct.

19 DR. JORDAN: All right.

20 MR. BAXTER: I don't know if it is any help., The
21 Exhibit at page 10 describes what I think the witnesses were
22 attempting to use this for. It says they compared the
23 system with the GDCs that are directly applicable to the
24 system design.

25 MS. WEISS: That is exactly what we are going to

1 be questioning on then.

2 (The Board conferred.)

3 CHAIRMAN SMITH: I think part of the problem is
4 that the Board question, of course, was presented in a void
5 of any record whatever, and it is something we want to be
6 assured on, but now we are looking at the question with a
7 background of a great deal of testimony on the subject. We
8 are going to permit you to continue along this line, so long
9 as it appears to be productive, but I hope that you will
10 select your criteria with that in mind, and you are not
11 going to just go through every one of them.

12 MR. POLLARD: No. It is my intention to go
13 through primarily only those that are on the cross
14 examination plan.

15 CHAIRMAN SMITH: Okay. In this discussion I had
16 not referred to your cross examination plan.

17 MR. POLLARD: For example, I do not intend to ask
18 the witness about GDC 10.

19 CHAIRMAN SMITH: I had overlooked the cross
20 examination plan on the question.

21 BY MR. POLLARD: (Resuming)

22 Q Does General Design Criterion 1 apply to the
23 emergency feedwater system?

24 A (WITNESS CAPODANNO) Yes, I think it does.

25 Q At the time of restart, will the emergency

1 feedwater system fully comply with GDC 1?

2 A (WITNESS CAPODANNO) Yes, I believe it will.

3 Q Does General Design Criterion 2, fire protection,
4 apply to the emergency feedwater system?

5 (Pause)

6 A (WITNESS LANESE) Excuse me. Is that in
7 relationship to LOCA or in general?

8 Q It is in relationship to the wording of the
9 criterion which states, "Structures, systems, and components
10 important to safety shall be designed and located to
11 minimize, consistent with other safety requirements, the
12 probability and effect of fires and explosions."

13 A (WITNESS LANESE) What I am getting at is if you
14 are asking if that has to be applied simultaneously with a
15 LOCA, our answer would be no, it does not apply.

16 Q Does the emergency feedwater system have to be
17 designed such that a fire cannot disable the emergency
18 feedwater system? That is the sense in which I asked the
19 question, does General Design Criterion 3 apply to emergency
20 feedwater?

21 A (WITNESS LANESE) We would have to review the
22 previous fire hazards analysis to determine if emergency
23 feedwater was required to shut the plant down subsequent to
24 a fire.

25 Q What other way is there to remove heat from a shut

1 down reactor at full temperature and pressure other than
2 through the steam generators which you are relying upon for
3 restart?

4 A (WITNESS LANESE) That is one way. The main
5 feedwater system might also be available. It would depend
6 upon the location of the fire. For example, if you were to
7 postulate a fire in the intermediate building, the main
8 feedwater system should still be available, or might still
9 be available. I am being hypothetical now.

10 Q We are not up to the point of asking you yet
11 whether or not you meet GDC at the time of restart, GDC 3.
12 I am only asking you at this point does GDC 3 apply to the
13 emergency feedwater system?

14 A (WITNESS LANESE) I would think it does, yes.

15 Q The next question is, at the time of restart, do
16 you know whether or not the emergency feedwater system will
17 fully comply with GDC 3?

18 A (WITNESS LANESE) To the best of my knowledge, it
19 complied prior to restart. We are not doing anything that
20 would change that compliance.

21 Q Does -- in preparing your testimony and this
22 exhibit, did you specifically look to see whether the
23 emergency feedwater system complies with General Design
24 Criterion 3?

25 A (WITNESS LANESE) I did not re-review the fire

1 hazards analysis, no.

2 Q Did you do anything else to try and determine
3 whether the emergency feedwater system complies with the GDC
4 3?

5 A (WITNESS LANESE) We had been required to do a
6 fire hazards analysis for the -- I think several years ago,
7 and that was a detailed analysis which determined whether
8 the plant was capable of being safely shut down as a result
9 of design basis fires, and that has been reviewed by other
10 people within our organization. I have some cognizance of
11 the results which said yes, we could meet -- we could shut
12 the plant down safely after a fire. That was reviewed and
13 approved by the staff, and I can think of nothing that we
14 are doing that would change those results.

15 Q Does General Design Criterion 13, instrumentation
16 and control apply to the emergency feedwater system?

17 A (WITNESS LANESE) No, I do not think so.

18 Q It is your testimony, though, that you are relying
19 upon emergency feedwater to mitigate small break loss of
20 coolant accidents and loss of main feedwater transients, is
21 that correct?

22 A (WITNESS LANESE) That is right.

23 Q Can you explain to me, please, why you think
24 General Design Criterion 13 does not apply to the emergency
25 feedwater system?

1 A (WITNESS LANESE) It specifically addresses those
2 variables and systems that can affect the fission process,
3 the integrity of the reactor cooler/reactor coolant pressure
4 boundary containment and associated systems.

5 Q It is your testimony, then, that you think the
6 operation of failure of the emergency feedwater system
7 cannot affect the integrity of the core?

8 A (WITNESS LANESE) I think the intention of the
9 General Design Criteria is with respect to emergency core
10 cooling systems, and the General Design Criteria that apply
11 to ultimate heat sinks are those that are applicable to the
12 emergency feedwater system.

13 Q Is loss of main feedwater an anticipated
14 operational occurrence within the meaning of GDC 13?

15 A (WITNESS LANESE) Loss of feedwater is an
16 anticipated operational occurrence as defined in Appendix A.

17 Q Can I refer you, please to NUREG-0578, page A-32.
18 The first paragraph on page A- --

19 MR. BAXTER: Excuse me, Mr. Pollard, it will take
20 us just a minute to find it.

21 (Pause)

22 BY MR. POLLARD: (Resuming)

23 Q The first paragraph on A-32 states, "The issuance
24 of a standard review plan, the auxiliary feedwater systems
25 in PWR designs has been treated as a safety system. It is

1 used to remove heat from the reactor system with the main
2 feedwater system is not available. General Design Criteria
3 13 of Appendix A in 10 CFR Part 50 sets for the requirements
4 for instrumentation to monitor the variables and systems
5 over their anticipated ranges of operations that can affect
6 reactor safety."

7 Would you like to reconsider, in light of this
8 paragraph, whether or not General Design Criteria 13 applies
9 to the emergency feedwater system?

10 A (WITNESS LANESE) No, there is always some matter
11 of interpretation in the General Design Criteria. Even the
12 staff is not consistent in saying that GDC 13 applies. For
13 example, the standard review plan does not reference GDC
14 13. I do not think we would have any quarrel with the fact
15 that the instrumentation system for emergency feedwater has
16 to be -- monitor the appropriate variables over the
17 appropriate ranges.

18 Q Well, is there a GDC which specifies
19 instrumentation to monitor the variables over their
20 anticipated ranges which you believe does apply to the
21 emergency feedwater system if it is not GDC 13?

22 A (WITNESS LANESE) I think in general it would
23 still be the General Design Criteria for fluid systems.

24 Q Which one is that, please?

25 A (WITNESS LANESE) For example, 34. It does not

1 specifically reference monitoring variables over the
2 appropriate range. I am not arguing with the idea that we
3 need an instrumentation system that has to monitor variables
4 over their appropriate range.

5 Q To the extent that the words of General Design
6 Criterion 13 reflect what you believe to be the requirements
7 for emergency feedwater that may be implicit in some other
8 General Design Criterion, will the emergency feedwater
9 system, prior to restart, comply with those requirements?

10 A (WITNESS CAPODANNO) I would say yes, in the
11 context that Mr. Lanese has just provided, in that we have
12 instrumentation to indicate flow and instrumentation to
13 indicate steam generator levels. There is also
14 instrumentation to indicate status of components in the
15 system operating, not operating, open or closed. I think
16 that provides sufficient instrumentation to allow one to
17 monitor the important variables of the system.

18 DR. JORDAN: Are you also saying that those
19 instruments meet the safety grade criteria?

20 WITNESS CAPODANNO: For restart, we have said that
21 with qualification, yes, some do. I think I identified the
22 other day the qualification of certain transmitters, where
23 their aging characteristics have not been fully determined
24 by the manufacturers.

25 DR. JORDAN: I feel they do meet, however,

1 the single failure criteria?

2 WITNESS CAPODANNO: Yes.

3 BY MR. POLLARD: (Resuming)

4 Q Does General Design Criterion 20 apply to the
5 emergency feedwater system? The title of it is Protection
6 System Functions.

7 A (WITNESS CAPODANNO) No.

8 Q Can you explain to me why it does not apply?

9 A (WITNESS LANESE) In the table of contents for
10 Appendix A, Criteria 20 through 29 are grouped under
11 reactivity and protection systems, and my understanding of
12 those criteria has always been that they apply to the
13 reactor protection system, and later on they had been
14 extended to emergency core cooling systems, and I think they
15 primarily refer to prompt initiation as a result of prompt
16 initiation for large break LOCAs and for reactivity
17 transients.

18 Q Is the emergency feedwater system being used -- is
19 it your position that the emergency feedwater system at the
20 time of restart will be relied upon to mitigate small break
21 loss of coolant accidents?

22 A (WITNESS LANESE) In certain break ranges, that is
23 correct.

24 Q You just told me you thought General Design
25 Criterion 20 had been applied to ECCS systems.

1 A (WITNESS LANESE) I do not agree that emergency
2 feedwater is an ECCS system.

3 Q But you would agree tht it performs a function of
4 cooling the core during loss of coolant accidents.

5 A (WITNESS LANESE) It serves a function as an
6 ultimate heat sink, yes.

7 Q And that without it you would not be able to cool
8 the core unless you resorted to something like bleed and
9 feed.

10 A (WITNESS LANESE) Yes. That is also true of many
11 other ultimate heat sink components and the pump components
12 on systems.

13 MR. POLLARD: Mr. Chairman, rather than taking
14 time right now, may I suggest that we take our lunch break
15 and we will resume this questioning after lunch?

16 CHAIRMAN SMITH: Okay. We will return at 1:10.

17 (Whereupon, at 12:05 o'clock p.m., the hearing in
18 the above-entitled matter recessed, to reconvene at 1:10
19 o'clock p.m. the same day.)

20 - - -

21

22

23

24

25

1 AFTERNOON SESSION

2 MR. BAXTER: Mr. Chairman, Mr. Lanese has advised
3 me over the lunch hour that he made an error in one of the
4 answers he gave to Mr. Pollard earlier. I believe it was on
5 the question leading out of the examination on GDC 13 as to
6 whether there was another general design criterion which
7 might relate to instrumentation and controlled supplies to
8 emergency feedwater.

9 The reference was to General Design Criterion 34.
10 Did you have a change to make to that testimony, Mr. Lanese?
11 Whereupon,

12 LOUIS C. LANESE

13 and

14 GARY R. CAPADANNO

15 the witnesses on the stand at the time of the noon recess,
16 resumed the stand and were further examined and testified as
17 follows:

18 WITNESS LANESE: Yes. I meant General Design
19 Criterion 44.

20 MR. POLLARD: In the further questioning we will
21 be using Standard Review Plan Sections 7.3 and 7.4. We will
22 also be using from the restart report, Chapter 2, and
23 Supplement I, Part 1 and Part 3.

24 MR. BAXTER: Will the witnesses be provided with
25 copies of the Standard Review Plan sections?

1 MR. POLLARD: Standard Review Plan Section 7.3 is
2 among proposed exhibits from the staff. I don't recall if
3 they have actually introduced it yet.

4 MS. WEISS: We don't have extra copies of it.
5 This is questioning which we did not know we were going to
6 have to make, but we will show the witness a copy, and he
7 can read it. We have one copy.

8 MR. BAXTER: I think counsel and the Board ought
9 to be able to follow along. I hate to suggest another
10 break, but I don't think I have copies of the Standard
11 Review Plan sections here. I might be able to locate them
12 across the street.

13 CHAIRMAN SMITH: All right. We'll take a break.

14 (Brief recess.)

15 CHAIRMAN SMITH: Back on the record.

16 CROSS EXAMINATION - Resumed

17 BY MR. POLLARD:

18 Q Section 7.1 of the Standard Review Plan has
19 attached to it Table 1 which is entitled -- Table 7-1
20 entitled "Acceptance Criteria for Instrumentation and
21 Controls." And the table lists among other things all of
22 the -- well, at least many of the general design criteria,
23 and then it has columns for Section 7.3 and 7.4 of the
24 Standard Review Plan showing which criteria are applicable
25 to which systems.

1 I will show it to you after I stop my
2 introduction. Then you can refer to it.

3 CHAIRMAN SMITH: Do you have that to which he is
4 referring?

5 MR. BAXTER: No.

6 CHAIRMAN SMITH: You don't have that.

7 MR. POLLARD: The witnesses do have 7.3.

8 MR. BAXTER: Yes.

9 MR. POLLARD: But the staff does not.

10 MR. CUTCHIN: The staff does not have a copy of
11 that, nor am I able to determine that we have a copy
12 available across the street.

13 (Pause.)

14 CHAIRMAN SMITH: Apparently there is going to be
15 quite a bit of this back and forth.

16 MR. POLLARD: No. That is all.

17 CHAIRMAN SMITH: Okay.

18 MR. POLLARD: You could run those two pages if you
19 wish to illustrate the GDC.

20 (Discussion off the record.)

21 MS. WEISS: I am distributing to the parties a
22 two-page table 7-1 entitled "Acceptance Criteria for
23 Instrumentation of Controlled Systems" from Section 7.1 of
24 the NRC Standard Review Plan.

25 (Counsel distributing documents to parties.)

1 MR. POLLARD: This is Revision I. It is down at
2 the lefthand side of the table.

3 (Witnesses reviewing documents.)

4 MS. WEISS: Perhaps we should give it an exhibit
5 number for identification purposes.

6 CHAIRMAN SMITH: That would be UCS Exhibit 7.

7 MR. POLLARD: We already have in 7 and 8, I am
8 sure of that.

9 CHAIRMAN SMITH: Okay. So it is 9.

10 MS. WEISS: I think it is 9. That is what I
11 thought. The document will be UCS Exhibit 9.

12 (The document referred to was
13 marked as UCS Exhibit No. 9
14 for identification.)

15 MR. POLLARD: Am I correct the witnesses have
16 before them Section 7.3 of the Standard Review Plan entitled
17 "Engineered Safety Features Systems." Down at the bottom
18 righthand corner is labeled Revision I.

19 WITNESS LANESE: Yes. I am in possession of it.

20 BY MR. POLLARD: (Resuming)

21 Q What I would like to do is summarize parts of it
22 and then see if you disagree with any part of it. This
23 section of the Standard Review Plan describes how the staff
24 reviews typical engineered safety features systems, and that
25 included among typical engineered safety features systems

1 are pressurized water reactor auxiliary feedwater systems.
2 And also noted on the front page there is a parenthetical
3 phrase which says "See Standard Review Plan Section 7.4 for
4 review of the safe shutdown functions of this system,"
5 meaning the auxiliary feedwater system.

6 Is that correct?

7 A (WITNESS LANESE) That is what the page shows.

8 Q If you would turn now to page 7.3-3, paragraph
9 labeled "Acceptance Criteria." The first sentence reads,
10 "Acceptance criteria for the review areas of the Standard
11 Review Plan section are referenced in Table 7-1, reference
12 3, and include the General Design Criteria, industry
13 standards, regulatory guides, and branch technical positions
14 that are applicable to the ESFAS and the instrumentation and
15 controls of essential auxiliary supporting systems."

16 I would like now to direct your attention to UCS
17 Exhibit 9. Is it correct that the Standard Review Plan
18 indicates that General Design Criterion 13 is applicable to
19 systems covered in Standard Review Plan, Sections 7.3 and
20 7.4?

21 A (WITNESS LANESE) That is correct.

22 Q Would you agree that that means, at least as far
23 as the staff is concerned, that the requirements of GDC 13
24 apply to what they call auxiliary feedwater systems which
25 you call emergency feedwater systems?

1 A (WITNESS LANESE) No, I do not agree.

2 Q You do not agree that that is --

3 A (WITNESS LANESE) No.

4 Q You don't agree with the Standard Review Plan?

5 A (WITNESS LANESE) I do not agree that that is what
6 the Standard Review Plan indicates.

7 Q Could you please tell me what the Standard Review
8 Plan indicates?

9 A (WITNESS LANESE) Based on Standard Review Plan
10 10.4.9, the staff calls out the general design criteria that
11 specifically apply to auxiliary feedwater systems.

12 Q Now, in that Section 10, is that Section 10 of the
13 Standard Review Plan referring primarily to the mechanical
14 portions of the system?

15 (Pause.)

16 A (WITNESS LANESE) That is with respect to
17 mechanical and instrumentation for secondary review. The
18 problem I am having differentiating is that while there are
19 x's in all those columns, there are many systems that are
20 referenced in the introduction to that Standard Review
21 Plan. So I do not know that every x applies in every
22 instance to every system.

23 Q And you are familiar with the Standard Review Plan
24 to the extent you know that there is also a section of the
25 Standard Review Plan that applies to emergency core cooling

1 systems, is that correct?

2 A (WITNESS LANESE) That is correct.

3 Q And that it appears that Section 7.3 also applies
4 to emergency core cooling systems, is that correct?

5 A (WITNESS LANESE) That is correct.

6 Q So isn't it possible that the Standard Review Plan
7 is organized such that the instrumentation and controls for
8 a system are covered in Section 7.3, and the mechanical
9 portions for ECCS are covered in Chapter 6, and the
10 mechanical portions of emergency feedwater are covered in
11 Section 10?

12 A (WITNESS LANESE) Yes.

13 Q Okay. Back to Table 7-1, UCS Exhibit 9. At line
14 K it says "General Design Criterion 20, Protection System
15 Functions." Would you agree that the Standard Review Plan
16 indicates that GDC 20 also applies to the systems, the
17 instrumentation and controls for systems covered by Sections
18 7.3 and 7.4?

19 A (WITNESS LANESE) Yes, I do.

20 Q With respect to your testimony now that General
21 Design Criterion 20 applied to the emergency feedwater
22 system --

23 MR. BAXTER: Excuse me. I need a clarification.
24 Is the question the TMI-1 emergency feedwater system?

25 MR. POLLARD: Yes.

1 WITNESS LANESE: My testimony stands as it is.

2 BY MR. POLLARD: (Resuming)

3 Q That General Design Criteria 20 does not apply to
4 auxiliary feedwater systems.

5 A (WITNESS LANESE) That is correct. I think the
6 requirements for the instrumentation systems are at least
7 implied.

8 MS. WEISS: Would you say that again?

9 WITNESS LANESE: The requirements for the
10 instrumentation systems for emergency feedwater are implied
11 by the general design criteria for ultimate heat sinks.

12 BY MR. POLLARD: (Resuming)

13 Q Which was GDC 44.

14 A (WITNESS LANESE) Forty-four, 45, 46.

15 Q Would you agree GDC 44 is in a section of the
16 general design criterion, Section 4, which is labeled "Fluid
17 Systems?"

18 A (WITNESS LANESE) That is correct.

19 Q Would you agree that General Design Criterion 20
20 is in a section of the general design criterion labeled
21 Section 3, "Protection and Reactivity Control Systems?"

22 A (WITNESS LANESE) That is correct.

23 Q Let me ask you what instrumentation do you believe
24 General Design Criterion 20 applies to, recognizing that
25 there are also criteria which are applied to ECCS systems

1 listed in the GDC which apply to fluid systems such as the
2 decay heat removal? What is unique about GDC 20? What
3 instrumentation does it apply to?

4 A (WITNESS LANESE) Could you repeat the last part?
5 Did you say what section does it apply to?

6 Q What instrumentation and controls does General
7 Design Criterion 20 apply to?

8 A (WITNESS LANESE) As originally written I believe
9 it applied to reactor trip functions, and it was later
10 extended to include initiation of emergency core cooling
11 systems. That would include containment protection and high
12 pressure/low pressure injection.

13 Q And General Design Criterion 35, Emergency Core
14 Cooling System -- Emergency Core Cooling, is in the same
15 section of the GDC as GDC 44, is it not?

16 A (WITNESS LANESE) Yes, it is.

17 Q But your testimony is that GDC 20 applies to the
18 instrumentation and controls for the systems referenced in
19 GDC 35, but it does not apply to the instrumentation and
20 controls for the systems referenced in GDC 44, is that your
21 testimony?

22 A (WITNESS LANESE) Yes, because again as originally
23 written that section was intended to mean the reactor
24 protection system, and it was extended to emergency core
25 cooling.

1 Q You were trying to make a distinction apparently
2 between what was originally written and what happened
3 later. What I would like to know is right now today or
4 perhaps at the time of restart does General Design Criterion
5 20 apply to Three Mile Island Unit 1 emergency feedwater
6 systems?

7 MR. BAXTER: Objection, Mr. Chairman. The witness
8 has answered the question before lunch and after lunch.
9 This is the third time it has been posed.

10 MS. WEISS: Let me -- let's withdraw that one.

11 You were asked a question about whether it is your
12 opinion that GDC 20 applies to the systems included within
13 GDC 35 but not to the systems included within GDC 44, and
14 your answer was yes. You then gave an explanation which
15 made a distinction between as originally written and as
16 currently interpreted. I want to make sure I understand
17 your answer.

18 BY MS. WEISS:

19 Q As of today, how it is now interpreted, is it your
20 understanding that GDC 20 applies to the systems covered by
21 GDC 35 but not to the systems covered by GDC 44?

22 A (WITNESS LANESE) That is correct.

23 Q Would you tell me why as now written that is -- as
24 now interpreted that is the case?

25 A (WITNESS LANESE) The systems described under GDC

1 35 are emergency core cooling systems. The systems
2 described under GDC 44 are ultimate heat removal systems,
3 and that is the distinction I understand between those.

4 Q Where does it say that GDC 20 does not apply to
5 ultimate heat sink systems?

6 A WITNESS LANESE) It does not say that in the
7 affirmative in GDC 20.

8 Q Is there anything other than your own opinion that
9 supports this interpretation of the scope of General Design
10 Criteria 20?

11 MR. BAXTER: I object to the question, Mr.
12 Chairman. They have asked the witness for his opinion. If
13 it were clear from the regulation, I assume UCS could simply
14 cite it in their proposed findings.

15 MS. WEISS: The question was anything other than
16 his opinion. Does it state anywhere in any NRC staff
17 document that General Design Criterion 20 does not apply to
18 the instrumentation and controls for emergency feedwater?

19 WITNESS LANESE: I think you have asked me two
20 different questions.

21 BY MS. WEISS: (Resuming)

22 Q Does it appear anywhere in any NRC documents that
23 General Design Criterion 20 does not apply to the
24 instrumentation and control for pressurized water reactor
25 emergency feedwater systems?

1 A (WITNESS LANESE) No.

2 BY MP. POLLARD:

3 Q I understand now you do not think the General
4 Design Criterion 20 applies to emergency feedwater systems,
5 but let me ask you at the time of restart will the
6 instrumentation and controls for emergency feedwater meet
7 the requirements set forth in GDC 20?

8 A (WITNESS LANESE) Yes.

9 Q Okay. Referring now to Table 7-1 of the Standard
10 Review Plan, would you agree that it indicates that General
11 Design Criterion 21 applies to the instrumentation and
12 controls for those systems covered by Sections 7.3 and 7.4
13 of the Standard Review Plan?

14 A (WITNESS LANESE) Yes.

15 Q Does General Design Criterion 21 apply to the
16 Three Mile Island Unit 1 emergency feedwater systems?

17 A (WITNESS LANESE) No, I do not believe so.

18 Q At the time of restart will the Three Mile Island
19 Unit 1 emergency feedwater system meet the requirements set
20 forth in GDC 21, recognizing your opinion that it does not
21 apply?

22 (Pause.)

23 A (WITNESS LANESE) I believe we would need GDC 21.

24 Q I'm sorry. I did not hear you.

25 A (WITNESS LANESE) I believe we would need GDC 21

1 at the time of restart.

2 Q In answer to my last question, did you think at
3 the time of restart the emergency feedwater system will
4 comply with the requirements of GDC 21, is that answer based
5 upon any specific review or is that your general opinion
6 today?

7 A (WITNESS LANESE) Based on my understanding of the
8 system design and my understanding of GDC 21 I think we meet
9 the requirements of GDC 21.

10 Q In other words, you have done a specific analysis
11 to see whether or not you meet GDC 21.

12 A No. As I said, based on my understanding of the
13 design and my understanding of the GDC, I believe we need it.

14 Q Okay. Referring again to Table 7-1 of the
15 Standard Review Plan, would you agree that that indicates
16 that General Design Criterion 22 applies to the
17 instrumentation and controls for those systems covered by
18 Standard Review Plan Sections 7.3 and 7.4?

19 A (WITNESS LANESE) Yes, I do.

20 Q Does General Design Criterion 22 apply to the
21 emergency feedwater systems for Three Mile Island Unit 1?

22 A (WITNESS LANESE) Yes, they do.

23 Q Can you explain to me why GDC -- why you believe
24 GDC 22 applies to Three Mile Island Unit 1 emergency
25 feedwater systems but GDC 20 and 21 do not?

1 A (WITNESS LANESE) I must have misunderstood your
2 question. I do not believe GDC 22 applies to the emergency
3 feedwater system. I believe that we would meet it.

4 Q You were anticipating my next question. You
5 believe you would meet it at the time of restart.

6 A (WITNESS LANESE) That is right.

7 Q Thank you.

8 Would you believe that Table 7-1 indicates that
9 General Design Criterion 23 applies to instrumentation and
10 controls of the systems covered by Standard Review Plan
11 Sections 7.3 and 7.4?

12 A (WITNESS LANESE) Yes.

13 Q Does General Design Criterion 23 apply to the
14 emergency feedwater systems at Three Mile Island Unit 1?

15 A (WITNESS LANESE) No.

16 Q At the time of restart will the emergency
17 feedwater systems at Three Mile Island Unit 1 comply with
18 the requirements of GDC 23?

19 A (WITNESS LANESE) No, it would not.

20 Q Can you tell me in what respects it will not
21 comply with it?

22 A (WITNESS LANESE) It would not be qualified with
23 respect to postulated adverse environments, namely extreme
24 heat and steam. Again, it is a high energy line break in
25 the intermediate building.

1 Q Paying particular --

2 A (WITNESS LANESE) Could we back up on that a
3 second?

4 Q Sure.

5 A (WITNESS LANESE) I think I was thinking in
6 general about the mechanical equipment. I do not believe
7 there are any of the instrumentation systems that would be
8 subject to the adverse environment in the intermediate
9 building, so from an instrumentation and controls point of
10 view, with the exception of the control of the regulating
11 valve I would -- I think we meet GDC 23.

12 Q Okay. With respect to the -- did you refer to
13 them as regulator valves?

14 A (WITNESS LANESE) The EFV 30 valves.

15 Q With respect to the regulator valves is the reason
16 you do not meet GDC 23 involve loss of air?

17 A (WITNESS CAPODANNO) No, sir.

18 Q Perhaps, Mr. Lanese, you can first explain to me
19 why you believe it will not meet GDC 23, the recirculation
20 valves.

21 A (WITNESS LANESE) Again, it would be the operation
22 of the valve in that environment. I think the connected
23 electrical wiring and at this point an inability to recall
24 if there is any instrumentation specifically located on that
25 valve that might cause it to fail.

1 ✓ Mr. Capodanno, did you wish to add something?

2 A (WITNESS CAPODANNO) Yes. We have identified for
3 those valves at least a couple of areas where we have
4 suspicions. I don't believe we have absolute proof yet that
5 components are or are not good for the resultant
6 environments. Those areas involve some of the materials of
7 construction of the valve. Elastomers, in particular, I
8 don't believe have complete qualification. And secondly,
9 there is a device called an electric to pneumatic converter
10 that is used for the operation of those valves that is in a
11 similar situation. That device is not mounted on the valve,
12 but it is located in the area where the valves are, and that
13 device likewise either must be completely qualified, or in
14 the longterm it would have to be replaced to satisfy the
15 environmental conditions -- the conditions being those
16 postulated for a high energy line break.

17 Q Referring again to Table 7-1 of the Standard
18 Review Plan would you agree that it indicates that General
19 Design Criterion 24, separation of protection and control
20 systems, applies to the instrumentation and controls of
21 those systems covered by Standard Review Plan Sections 7.3
22 and 7.4?

23 A (WITNESS LANESE) Yes, I do.

24 Q Does General Design Criterion 24 apply to the
25 emergency feedwater systems at Three Mile Island Unit 1?

1 A (WITNESS LANESE) No, it does not.

2 Q At the time of restart will the Three Mile Island
3 Unit 1 emergency feedwaters meet the requirements of GDC 24?

4 A (WITNESS LANESE) Yes, I believe it would.

5 Q Referring to the next page of Table 7-1 of the
6 Standard Review Plan would you agree that it indicates that
7 General Design Criterion 29, protection against anticipated
8 operational occurrences, applies to the instrumentation and
9 controls of those systems covered by Standard Review Plan
10 Sections 7.3 and 7.4?

11 A (WITNESS LANESE) Yes, I would.

12 Q Does General Design Criterion 29 apply to the
13 emergency feedwater systems of Three Mile Island Unit 1?

14 A (WITNESS LANESE) No, it does not.

15 Q At the time of restart will the emergency
16 feedwater systems at Three Mile Island Unit 1 meet the
17 requirements of GDC 29?

18 A Yes, I believe it will.

19 Q Could you please refer to the Restart Report,
20 Section 2, page 2.1-7, which is labeled "Amendment 22?" I
21 am sorry. I meant to say 2.1-27. It is page 2.1-27,
22 Amendment 22. There is on that page a paragraph labeled "F"
23 which states, "Safety grade indication of auxiliary
24 feedwater flow to each steam generator is being provided in
25 the control room."

1 Can you tell me in that paragraph what the phrase
2 "safety grade" means in terms of which general design
3 criterion it must meet in order to be called safety grade?

4 A (WITNESS LANESE) The general design criterion
5 that we have referenced in our testimony in Table 1 of
6 Exhibit A.

7 Q Of Exhibit 15?

8 A (WITNESS LANESE) Exhibit 15, excuse me.

9 Q That is all.

10 A (WITNESS LANESE) I think we have also indicated
11 that GDC 1 is applicable.

12 Q Okay. Now, is this safety grade indication of
13 auxiliary feedwater flow through each steam generator being
14 provided prior to restart?

15 A (WITNESS LANESE) Yes.

16 Q What changes had to be made in order to make it
17 safety grade?

18 A (WITNESS CAPODANNO) I am not sure I understand
19 the question.

20 Q I am sorry. Perhaps I should ask a different
21 question. At the time of the Three Mile Island Unit 2
22 accident was this flow instrumentation provided in the
23 control room and was it safety grade or is this a change
24 since the accident?

25 A (WITNESS CAPODANNO) This is in addition for

1 restart. It did not exist at the time of the TMI accident.

2 Q The second sentence in paragraph F states -- I am
3 sorry. You have already answered my question. Would you
4 refer now to the paragraph immediately following the
5 paragraph labeled "G?" The second sentence states, "In
6 addition, provision for testing of the initiating circuits,
7 although not currently included in the design, will be
8 provided."

9 The provision for testing that that sentence
10 refers to, will that be provided prior to restart?

11 A (WITNESS CAPODANNO) It is my understanding that
12 those provisions will be included prior to restart.

13 Q Can you tell me which general design criterion
14 requires such testing?

15 A (WITNESS CAPODANNO) Again, I think in the table
16 attached to our exhibit we have not identified any specific
17 design criteria that does that.

18 Q That may be true. The question still remains, do
19 you know which GDC requires such testing of these initiating
20 circuits for emergency feedwater systems?

21 A (WITNESS CAPODANNO) I think we have also answered
22 that in the context that you questioned Mr. Lanese on
23 Criterion 21 about reliability and testability, and he
24 stated he did not feel it applied directly to emergency
25 feedwater.

1 Q So there is no general design criterion that
2 requires the initiating circuits for initiating feedwater,
3 is that your testimony?

4 A (WITNESS CAPODANNO) I believe that is correct,
5 yes.

6 Q Can I now direct your attention to Section 2.1.2.6
7 of the Restart Report which begins on page 2.1-41, labeled
8 "Amendment 18," and continuing on page 2.1-42, labeled
9 "Amendment 22." It indicates there that the auxiliary
10 feedwater system autostart circuits are being implemented in
11 two phases. First, as a control grade autostart which is a
12 short-term approach, and then item 2 is the safety grade
13 autostart, and that would be a long-term modification where
14 the initiation will meet the requirements for Class 1-E
15 systems and the system as functionally described below.

16 My question is does this section accurately
17 reflect those changes which will be done after restart?

18 A (WITNESS CAPODANNO) No, that is no longer true.
19 When this particular paragraph was written -- and I do not
20 see a date on here, but the timeframe was such that the
21 modification was going to be control grade only, based
22 primarily on the fact that a significant amount of the
23 hardware was already in the plant.

24 Because of the delay in restart I believe we have
25 safety grade components available, and they will be

1 installed for this auto initiation.

2 DR. JORDAN: For my information, you do refer to
3 Class 1-E. Where did the criteria for Class 1-E systems
4 appear? What are the criteria for 1-E systems?

5 WITNESS LANESE: I think we were referring to the
6 IEEE standards in that case.

7 DR. JORDAN: Is that generally true, when one
8 refers to a Class 1-E that one refers to IEEE standards?

9 WITNESS LANESE: Yes.

10 DR. JORDAN: IEEE-279 or other.

11 WITNESS LANESE: 279 is the implementing document
12 for most of the others. Most of the other documents are
13 interpretations of 279.

14 DR. JORDAN: Good.

15 BY MR. POLLARD: (Resuming)

16 Q Does IEEE-279 use the phrase "Class 1-E" at all?

17 A (WITNESS LANESE) No, it does not.

18 Q If you can refer to the subsequent page 2.1-42
19 which is labeled "Amendment 22," and Amendment 22 was dated
20 October 17, 1980, we would like to go through and ask you
21 some questions on page 2.1-42. Item 1, the second paragraph
22 states, "The system initiation on low steam generator level
23 will eventually be added. This will be done after the
24 necessary analysis and engineering have been completed to
25 assure that the signal will give a satisfactory actuation

1 and will not interact with other plant functions."

2 Will the automatic initiation of emergency
3 feedwater on low steam generator level be installed prior to
4 restart?

5 A (WITNESS LANESE) No, it will not.

6 Q At the first paragraph of item 1 it says, "The
7 safety grade emergency feedwater autostart will be
8 implemented -- when implemented will automatically initiate
9 the system on the presence of the following conditions with
10 or without the availability of offsite power."

11 At the time of restart will the automatic start
12 circuit for emergency feedwater be safety grade?

13 A (WITNESS LANESE) At the time of restart there
14 will be two safety grade autoinitiation circuits for
15 emergency feedwater, and there will be loss of both normal
16 feedwater pumps and loss of all four reactor coolant pumps.

17 Q And those two functions will be fully safety grade.

18 A (WITNESS LANESE) That is my understanding, yes.

19 Q But you will not have either the low steam
20 generator level or the low differential pressure between the
21 normal feedwater and main steam lines at either steam
22 generator.

23 A (WITNESS LANESE) No, we will not.

24 Q Item 2 on 2.1-42 states, "All cables associated
25 with the initiating logic will be qualified for Class 1-E

1 application, and the initiations will be designed to meet
2 the single failure criteria. All circuits will meet the
3 regulatory criteria for separation of Class 1-E circuits."

4 Will that requirement be met prior to restart?

5 A (WITNESS CAPODANNO) Yes, I believe it will.

6 Q What general design criterion requires this of
7 emergency feedwater systems?

8 (Pause.)

9 CHAIRMAN SMITH: What was the question?

10 MR. POLLARD: Which general design criterion
11 requires these features which are set forth in paragraph 2
12 on page 2.1-42 for emergency feedwater systems?

13 WITNESS LANESE: I cannot find a specific
14 reference outside of the series 20 general design criteria
15 that might apply.

16 BY MR. POLLARD: (Resuming)

17 Q But you would agree at least part of those
18 requirements in paragraph 2 on page 2.1-42 are incorporated
19 in General Design Criterion 21.

20 MS. WEISS: We withdraw that.

21 MR. POLLARD: I am sorry. Ellen corrected me. We
22 do not need you to answer that question unless you want to.

23 WITNESS CAPODANNO: Mr. Pollard, we identified in
24 Table 1 of the attachment to Exhibit 15 GDC 44, and that GDC
25 does make reference to a suitable redundancy in components

1 and features, and it also -- let's see. Well, it makes
2 mention of suitable redundancy in components and features,
3 which is one basis for drawing the conclusion about what you
4 asked.

5 BY MR. POLLARD: (Resuming)

6 Q But there is nothing in your exhibit for GDC 44
7 that talks about the separation of Class 1-E circuits, is
8 that correct?

9 A (WITNESS CAPODANNO) That is correct. It does not
10 specifically say Class 1-E circuits.

11 Q And it does not say anything about separation
12 either, is that correct?

13 A (WITNESS CAPODANNO) Are you referring to the text
14 of the GDC or the table in our exhibit?

15 Q Well, I thought you had referred me to the table
16 under GDC 44.

17 A (WITNESS CAPODANNO) I actually mentioned both.
18 That is what I am a little unclear. However, in either
19 event I don't see the words you mentioned.

20 (Pause.)

21 Q Mr. Lanese, when you answered you said you thought
22 this came from the series 20, the 20, 21, 22, 23, 24, which
23 you said you did not think applied to emergency feedwater,
24 is that correct?

25 A (WITNESS LANESE) That is correct. But I think

1 again in order to explain what I mean by the applicability
2 of GDC 44, those general design criteria are the places
3 where protective system instrumentation and control system
4 criteria are spelled out. They had a particular
5 applicability, and in the absence of any other criteria they
6 are applied in a limited manner to designing the ultimate
7 heat sink systems.

8 Q Now, on your exhibit on Table 1, page 3 where you
9 are talking -- excuse me -- page 4 where you are talking
10 about compliance with GDC 44, you indicate that at the time
11 of restart it will be partially not in compliance with GDC
12 44, is that correct?

13 A (WITNESS LANESE) That was with respect to other
14 events. That is correct.

15 Q And would you agree that if you don't meet GDC 44
16 you might also not meet the requirements of series 20 of the
17 GDC?

18 (Pause.)

19 A (WITNESS LANESE) In the context of our remarks as
20 to why we are in non-compliance I agree.

21 Q Okay. Referring to paragraph 3 on page 2.1-42 of
22 the Restart Report it states that, "The initiating logic
23 will include hardware for the following purposes," and it
24 specifies mentions testability of the initiating
25 circuit. This testability of the initiating circuit, will

1 the be completed and installed prior to restart?

2 A (WITNESS CAPODANNO) Yes, I believe it will.

3 Q Is there any difference between the testability of
4 the initiating circuit mentioned on page 2.1-42 with the
5 testability we talked about on page 2.1-27?

6 A (WITNESS CAPODANNO) I think perhaps there might
7 be in the sense we have mentioned on the top of page
8 2.1-42. Some initiating signals that we have identified
9 would not be in the plant for restart. So the extent --

10 Q If the circuits are not there, obviously they
11 cannot be testable.

12 A Yes.

13 Q I understand that.

14 CHAIRMAN SMITH: Ms. Weiss, I have lost the train
15 of the testimony on your cross examination plan. Could you
16 --

17 MS. WEISS: We have been off the cross examination
18 plan ever since we got the witnesses' answers that they did
19 not think any of the other GDC applied. So after that
20 paragraph, which is question 6-J, we have not been back to
21 that yet. We are working our way around back to it.

22 CHAIRMAN SMITH: So you got to page 3.

23 MR. POLLARD: We have covered everything on page 3
24 except the last paragraph.

25 CHAIRMAN SMITH: Except the last paragraph.

1 DR. JORDAN: I need some clarification. With
2 regard to control of flow in the emergency feedwater system,
3 I thought I understood that this would be done manually in
4 case the integrated control system was not working.

5 WITNESS CAPODANNO: That is correct.

6 WITNESS LANESE: That is correct.

7 DR. JORDAN: That is correct?

8 WITNESS LANESE: Yes.

9 DR. JORDAN: I see. So that in that sense then it
10 does not meet the criteria.

11 WITNESS LANESE: I think our major objection to --
12 our major difference with the criteria is we do not feel
13 that automatic and immediate flow control is necessary to
14 meet the acceptance criteria for the event.

15 DR. JORDAN: I see. So initiation will be
16 automatic.

17 WITNESS LANESE: Yes.

18 DR. JORDAN: It is the control that is not. This
19 is just for my information.

20 WITNESS LANESE: If the ICS does not work, then
21 that is right.

22 DR. JORDAN: I see. Thank you.

23 BY MR. POLLARD: (Resuming)

24 Q Paragraph 4 on page 2.1-42 of the Restart Report
25 states, "Indication will be provided in the control room to

1 identify the source of the initiation." Will that be
2 provided to restart?

3 A (WITNESS CAPODANNO) Yes.

4 Q Which general design criterion or NRC regulation
5 requires such indication?

6 MR. BAXTER: Objection. No foundation. There has
7 not been any testimony that it is required by any NRC
8 regulation or general design criterion. I also fail to see
9 the relevance of whether our motivation in putting it in is
10 to be responsive to a regulation or whether we are doing it
11 for some independent reason.

12 MS. WEISS: I think the point is that we got an
13 answer that a lot of the general design criteria do not
14 apply. We are now attempting to make a showing that in fact
15 they do, and one of the ways to make that showing is to show
16 that in fact they are the criteria which compel the various
17 steps which are being taken to upgrade emergency feedwater.

18 Now, if the licensee's position is going to be
19 they are not required by the general design criteria but we
20 have decided to do them anyway, well, maybe that -- then
21 that is something we have to know. But in our view it makes
22 an important difference because if what I take to be the
23 licensee's position is the correct one, then they have an
24 option whether or not to comply with other portions of the
25 general design criteria; and we do not believe that there is

1 an option.

2 MR. BAXTER: My concern was they are not asking
3 the witnesses why was this upgrade undertaken; did you do it
4 in response to a regulation or what you viewed to be an
5 applicable general design criterion. The question was which
6 one was it. And I just think they are one step ahead of
7 what the testimony is.

8 MS. WEISS: I don't think we need to ask the
9 question the way you want it asked.

10 MR. BAXTER: We have a larger problem about the
11 general design criteria which I can argue from the
12 regulations without a witness, but it may go to the worth of
13 spending this much time on the subject, and that is, the
14 effective date of that entire appendix to 10 CFR Part 50
15 which falls in 1971. And I believe that is -- well, after
16 the construction permit issued for this unit.

17 MS. WEISS: If that is going to be their position
18 then, you know, let's hear it. But in our view one defines
19 the reliability of a system primarily by reference to the
20 general design criteria. In other words, if you comply with
21 them, I think that be definition you have a reliable
22 system. If you do not comply with them, then there is a
23 good argument that you do not have a reliable system. And
24 it is in that context that we think it is important to know
25 from whence cometh these requirements, and we are asking

1 these specific questions with regard to Table 1 of Exhibit
2 15 which is entitled "Evaluation of TMI-1 EFW System Using
3 the General Design Criteria of 10 CFR Part 50, Appendix A."
4 Certainly that gives us the right to ask about the other GDC
5 that are not listed on the table.

6 It seems to me that they have waived their right
7 to argue that Appendix A does not apply. This is your
8 testimony. Is it your testimony that you can pick and
9 choose among the GDC? If so, we have a right to find out
10 the basis upon which you do so.

11 MR. BAXTER: Mr. Chairman, I am not going to
12 respond to Ms. Weiss, and I have not objected to questions
13 that went to other GDC. My objection is that instead of
14 asking the question why was a particular modification made
15 -- was it made in response to a general design criterion,
16 the question is which general design criterion required it,
17 and the witness has not testified.

18 CHAIRMAN SMITH: You made a similar objection
19 earlier. Mr. Pollard said if it was necessary he would ask
20 it as a preliminary matter. Then we went on and seemed to
21 be doing quite well, but I suppose we can accomplish that.

22 Now, I think the point that you are making, your
23 broader point, I guess it can be established on redirect if
24 you'd prefer. I think, though, the record might be better,
25 however, if it were established at the time the point was

1 brought up. However, that is your option, but I do think
2 that the record would be better.

3 MR. BAXTER: I see a difference between this
4 objection and the one earlier. The one earlier was do you
5 meet a particular general design criterion, and I objected
6 that they had not shown which one applied.

7 MS. WEISS: We are going to ask another question.

8 MR. BAXTER: This one is which criteria motivated
9 you to make a change, and they have not testified that any
10 did.

11 CHAIRMAN SMITH: He is perfectly capable of saying
12 that.

13 MS. WEISS: We are going to ask another question.
14 In any case, I have lost track of what the original one was.

15 MR. POLLARD: I will withdraw the question and
16 start again.

17 BY MR. POLLARD: (Resuming)

18 Q With respect to paragraph 4 on page 2.1-42, would
19 you agree that IEEE standard 279-1968 requires such
20 indication?

21 (Pause.)

22 A (WITNESS LANESE) I would agree that it is a
23 requirement of that standard.

24 Q And paragraph 5 on page 2.1-42 of the restart
25 report states that, "Annunciation will be provided in the

1 control room to alarm autostart of the emergency feedwater
2 system. This will be a common alarm for both the trains and
3 initiating conditions being bypassed. This will be a common
4 alarm for all initiating conditions associated with the same
5 train."

6 Will that annunciation described in paragraph 5 be
7 provided prior to restart?

8 A (WITNESS CAPODANNO) Yes, it will.

9 Q Would you agree that IEEE standard 279-1968
10 requires such annunciation?

11 (Pause.)

12 A (WITNESS LANESE) Yes, I agree.

13 CHAIRMAN SMITH: One of the things that is
14 confusing me -- I think it might be helpful -- one of the
15 things that has tended to confuse me during this current
16 debate is that the Restart Report along this line has
17 followed roughly the requirements of the hearing order, and
18 when -- not exactly, not in detail, but almost in the same
19 sequence.

20 What is, in your view, the difference between you
21 and these witnesses? These are requirements, general
22 requirements of the hearing order as short-term actions,
23 1-A, which in turn references the emergency feedwater
24 systems -- system. So could you explain -- I mean just for
25 guidance. I am not trying to suggest there is anything

1 wrong with your cross examination or anything else, but I
2 would like to know just where we are.

3 MS. WEISS: I think it is our position that in
4 response to the Board question asking generally about the
5 reliability of emergency feedwater, which is a very
6 pertinent issue, that the primary way in which you judge
7 that is with reference to the general design criteria. And
8 to the extent that -- if it were really true -- if it were
9 true, let me with out prejudging the matter, if it were true
10 that the licensee met all the GDC that we have discussed,
11 then it would not matter whether they thought they applied
12 or not. That would be of no importance.

13 But this is the first in the line of questions, I
14 think, to get at whether they are fully met, and the first
15 thing we needed to ask was do they apply, and we are now
16 going to get into whether they are in fact met.

17 Now, as far as the argument goes later on, I
18 anticipate from my knowledge of where we differ on my
19 interpretation of the facts that we may argue that certain
20 portions of the GDC are not met, where the licensee may
21 argue that they are and that it may become -- then it would
22 become important whether or not they in fact apply. So it
23 is really two stages. The line of questioning has to
24 involve, I think, both stages.

25 Did that help at all?

1 CHAIRMAN SMITH: Yes. That aspect of it was
2 pretty apparent, but then there is another aspect of the
3 debate which Mr. Baxter has raised which I do not understand
4 quite what your position is, and I am not sure I understand
5 Mr. Baxter's point entirely either.

6 I think it would be helpful if it could be
7 discussed thoroughly at this point. We could excuse the
8 witnesses while this discussion is going on, although I am
9 wondering for that matter whether the witnesses' judgment as
10 to the applicability of the GDC is binding upon the licensee
11 anyway, but that is a different matter.

12 I just think we need a better demonstration of
13 what is happening here, just the finer points of the dispute
14 between the parties.

15 MS. WEISS: I can tell you that our opinion is
16 that all of the GDC that we have gone over today, in
17 addition to the ones listed in the table, apply to emergency
18 feedwater. And it is our position that certain of them are
19 not met.

20 CHAIRMAN SMITH: Okay. Mr. Baxter, could you tell
21 us then what your objection is to this line? Already you
22 said you don't like this because da, da, da, da, because it
23 assumes that they are doing what they are doing because they
24 are required by the general design criteria.

25 MR. BAXTER: That is correct.

1 CHAIRMAN SMITH: Could you elaborate on that a
2 little bit?

3 MR. BAXTER: It really is not -- it is really not
4 a deep philosophical position, Mr. Chairman. It is simply
5 that it is not clear to me from the examination we have had
6 that necessarily all the things that are being done to
7 modify the emergency feedwater system before restart were
8 done based on licensee's or anyone else's analysis of the
9 general design criteria.

10 CHAIRMAN SMITH: And then we went from there
11 saying all right, you will have your chance to do that on
12 redirect, but it would be better, if you prefer, for it to
13 be established now because now you are done with that line
14 of questioning.

15 MR. POLLARD: Almost. I have two minor questions
16 first, then we will go back to our cross examination plan.

17 CHAIRMAN SMITH: Okay.

18 BY MR. POLLARD: (Resuming)

19 Q I am now referring to Supplement I, Part 1,
20 question 10-G as in "George." There is no page number or
21 amendment number noted of that section of the Restart Report
22 up here apparently.

23

24

25

1 A (WITNESS LANESE) We do not have that section of
2 the restart up here apparently.

3 Excuse me, we do have that section of the restart
4 report up here.

5 CHAIRMAN SMITH: Question 10?

6 MR. POLLARD: Question 10G.

7 DR. JORDAN: I find Questin 10 and Question 11.

8 CHAIRMAN SMITH: Question 9, no Question 10G.

9 MR. BAXTER: Supplement 1, Part 1.

10 CHAIRMAN SMITH: Supplement 1, Part 2.

11 DR. JORDAN: But you want --

12 MR. BAXTER: Part 1.

13 DR. JORDAN: That is what I meant.

14 MR. POLLARD: Is everyone ready?

15 BY MR. POLLARD: (Resuming)

16 Q In Question 10G, the NRC stated, "We require that
17 the emergency feedwater system should possess the capability
18 to automatically terminate auxiliary feedwater flow to a
19 steam generator and to automatically provide feedwater to
20 the intact steam generator."

21 My question is, on your response you indicate that
22 you do have provisions to isolate the flow to the
23 depressurized steam generator. My question is are such
24 features at the time of restart in compliance with the
25 single failure criterion?

1 (Pause)

2 A (WITNESS LANESE) Yes, in one sense only, and that
3 is that obviously we could get into a situation in which
4 there is no immediate emergency feedwater supply to either
5 steam generator. The consequences of that event are not
6 unacceptable.

7 Q I am sorry. Perhaps I did not phrase my question
8 correctly. With respect to the function of terminating flow
9 to the steam generator which has been depressurized, which
10 presumably has a leak, is the function of terminating flow
11 to that steam generator in compliance with the single
12 failure criteria?

13 A (WITNESS LANESE) I'm sorry, I did misunderstand
14 the question. No, it would not be.

15 Q And that in the long term you are going to make
16 modifications after restart such that it would be, is that
17 correct?

18 A (WITNESS CAPODANNO) Yes.

19 A (WITNESS LANESE) The additions of the cavitating
20 venturis.

21 Q And also the addition of another regulator valve
22 in parallel with the 30A and the 30B, as well as the
23 addition of two new isolation valves for those regulator
24 valves.

25 A (WITNESS LANESE) No, that is not correct. We

1 would meet the -- meet that criteria by virtue of the
2 cavitating venturis alone, so we would not automatically
3 terminate flow. We would limit it sufficiently that it
4 could be manually terminated without any undue effects.

5 Q I am sorry, I will have to ask one more question.

6 The staff's position was this has to be done
7 automatically. As I understand your answer now, you are
8 going to add cavitating venturis for the purpose of allowing
9 more time for the operator to do it, is that correct?

10 A (WITNESS LANESE) Yes. I think that Question 10G
11 is somewhat misleading because the staff, again, in standard
12 review plan 10.4.9, in one section it says exactly that,
13 that you have to automatically terminate emergency
14 feedwater, but in another section states that you have to
15 either terminate or limit emergency feedwater flow.

16 Q Can you please tell me which section that is that
17 says you have to terminate, or --

18 A (WITNESS LANESE) It is page 10.4.9-7.

19 Q And how did you decide to choose between
20 terminating or limiting?

21 A (WITNESS LANESE) We have been fairly consistent
22 in that from the design of TMI 2 in that we believe that the
23 cavitating venturis represent a better design option than
24 complete termination of flow.

25 MR. POLLARD: Mr. Chairman, for your information,

1 I am going back to the standard review plan now, the cross
2 examination plan, the last paragraph on page 3.

3 CHAIRMAN SMITH: Before you proceed, I notice that
4 Mr. Levin has appeared.

5 Did you just drop in as an observer, Mr. Levin, or
6 did you have business you would like to bring up?

7 MR. LEVIN: I am just an observer today.

8 BY MR. POLLARD: (Resuming)

9 Q If we can go back, now, to Table 1 of Licensee
10 Exhibit 15, the title of the table states "Evaluation of
11 Three Mile Island 1 Emergency Feedwater System Using the
12 General Design Criteria of 10 CFR 50 Appendix A."

13 My question is in preparing Table 1, did you
14 evaluate whether or not the essential auxiliary supporting
15 systems for emergency feedwater meet the General Design
16 Criteria of Appendix A?

17 (Pause)

18 A (WITNESS CAPODANNO) Yes. I think that was
19 considered in the overall answer.

20 Q If you did so, I am puzzled by the absence from
21 Table 1 of General Design Criterion 17 that deals with
22 electric power systems.

23 A (WITNESS CAPODANNO) Again, we tried to make the
24 point earlier that this table is looking at the system
25 itself, and that you could expand into some of the items we

1 have discussed today and Friday, such as HCIC systems,
2 electric power systems. We did not do that for the purposes
3 of Table 1.

4 Q Perhaps I misunderstood your answer, then. When
5 you were preparing Table 1 and listing those GDCs which you
6 either complied with or did not comply with, you did not
7 consider whether the essential auxiliary supporting systems
8 comply or do not comply.

9 A (WITNESS CAPODANNO) I understood your question to
10 be did we evaluate it and include responses for those
11 supporting systems in Table 1.

12 Q Yes.

13 A (WITNESS CAPODANNO) My answer is we looked at the
14 supporting systems, we did not include specific responses
15 for the supporting systems in Table 1.

16 Q So that from your testimony we determine whether
17 the essential auxiliary supporting systems for emergency
18 feedwater comply or do not comply with the General Design
19 Criteria, is that correct?

20 A (WITNESS CAPODANNO) I think in answer to one of
21 the earlier questions in the written testimony we did
22 identify these or lack of effects of supporting systems on
23 emergency feedwater operation. That is not specifically
24 included in the table. It is given in the direct testimony.

25 Q Yes. But as I recall the direct testimony, you

1 did not discuss specifically whether the supporting systems
2 meet or do not meet particular General Design Criteria,
3 isn't that correct?

4 A (WITNESS CAPODANNO) That is correct.

5 Q The first entry on Table 1 deals with General
6 Design Criterion 2, which covers design bases for protection
7 against natural phenomena, and you state that the Licensee
8 has become aware that some of the valves within the
9 emergency feedwater system do not fully satisfy seismic
10 Class 1 requirements.

11 My question is how did you become aware of this
12 fact?

13 A (WITNESS CAPODANNO) By reviewing documentation on
14 the emergency feedwater system such as the diagrams that are
15 in the restart report and other documents lists and such
16 that are in-house which are not included in the restart
17 report, and tracing those back through files to ultimately
18 stress reports for the valves within the system.

19 Q And this was done after the Three Mile Island Unit
20 2 accident, is that correct?

21 A (WITNESS CAPODANNO) Not entirely. My
22 understanding is, at least in the instance of two valves,
23 the FE 30A and B valves, that was identified prior to the
24 accident.

25 Q I am correct that the restart report did not exist

1 until after the Three Mile Island Unit 2 accident?

2 A (WITNESS CAPODANNO) Yes, that is correct.

3 Q Which valves do not fully satisfy seismic Class 1
4 requirements other than the two you just mentioned?

5 A (WITNESS CAPODANNO) At this point I am not
6 certain that any of the other valves do not meet the seismic
7 criteria.

8 Q But you are reviewing all the other valves, is
9 that correct?

10 A (WITNESS CAPODANNO) Yes, sir.

11 Q Of the valves you reviewed so far, are you certain
12 some of them do meet the requirements of GDC 2?

13 A (WITNESS CAPODANNO) Am I certain that some of
14 them do?

15 Q Yes, sir.

16 A (WITNESS CAPODANNO) Yes, sir, that is my
17 understanding. The ones that have been reviewed do satisfy
18 seismic criteria.

19 Q So the status of your review is you have
20 identified some valves that do meet GDC 2, some valves
21 don't, and you are still reviewing the other valves?

22 A (WITNESS CAPODANNO) Outside of the No. 30 valves,
23 I am not aware of any that have been reviewed to date that
24 do not meet seismic criteria.

25 Q But you are still conducting the review.

1 A (WITNESS CAPODANNO) Yes, it is still being
2 completed.

3 Q Licensee Exhibit 15 indicates that the future
4 system will fully comply with GDC 2, but that at the time of
5 restart you will not fully comply with GDC 2.

6 Why do you intend to continue your work on Three
7 Mile Island Unit 1 to make sure it does comply with GDC 2?

8 A (WITNESS CAPODANNO) I think there is something I
9 have to give a little bit of explanation on. This system
10 was designed to an older set of criteria --

11 DR. JORDAN: What?

12 WITNESS CAPODANNO: To an older set of criteria to
13 define seismic events, and in those days you identified
14 operating basis earthquake and design basis earthquake.
15 Current terminology and design practice is a little bit
16 different in that first of all it refers to safe shutdown
17 earthquake and one half of safe shutdown earthquake, and
18 does not establish the criteria in the same way, and in
19 fact, from what I am aware of, the seismic loadings under
20 the old criteria appear to be more conservative, that is,
21 higher than you would come up with under the new criteria.

22 So what we are reviewing this for is to see
23 whether or not in every instance we do or do not satisfy
24 either all the old criteria or the new criteria. It is
25 difficult when terminology changes to say that you do or do

1 not meet a specific criteria, and that is the intent of this
2 review, to find out where we stand in terms of current
3 criteria, and then be able to answer a question such as do
4 you or do you not fully meet GDC 2 as it is currently
5 written.

6 BY MR. POLLARD: (Resuming)

7 Q In the future, in your continuing investigation,
8 if you find any deficiencies you will correct them so that
9 in the future system you will fully comply with GDC 2 as now
10 interpreted?

11 A (WITNESS CAPODANNO) That is correct.

12 Q Why are you making this effort?

13 A (WITNESS CAPODANNO) Because we have always
14 identified that this system was seismically supported, and I
15 will say that in order to satisfy the question of is it or
16 is it not seismically supported, we would conduct this
17 review and then make changes appropriately so that it would
18 remain seismically supported.

19 Q So when you complete this review, you will have a
20 high degree of assurance that the system meets GDC 2 as
21 presently interpreted, and therefore would have a high
22 degree of assurance that the plant design is safe.

23 A (WITNESS CAPODANNO) I would not say that. I
24 think the seismic criteria, since they have changed, lead
25 you to have to make this investigation and come to the

1 ultimate decision. My feeling right now is that this system
2 is in fact seismically supported, and quite conservatively
3 designed, and will satisfy the current criteria with the net
4 result that there will be no change to the system.

5 Q You did identify two valves. Which two valves
6 were those?

7 A (WITNESS CAPODANNO) EFV 30A and B.

8 Q Do you intend to modify those valves or their
9 separate systems in the future?

10 A (WITNESS CAPODANNO) If the review, when completed
11 of those valves, identifies that they do not satisfy Seismic
12 criteria, they would be modified, yes.

13 Q And the present schedule calls for that review to
14 be completed after restart, is that correct?

15 A (WITNESS CAPODANNO) I think that effort is
16 ongoing now. It quite probably could be done before
17 restart. That is my understanding.

18 Q Is it your position that it must be done before
19 you are willing to restart the plant?

20 A (WITNESS CAPODANNO) No, sir, I do not think it
21 has to be.

22 Q With respect to Valves EFV 30A and 30B, what is
23 the status of your review with respect to those valves?
24 Have you determined that they do not now meet the present
25 interpretation of GDC 2?

1 A (WITNESS CAPODANNO) I am not positive of the
2 answer to that for the reason that there was a report done
3 earlier -- when I say earlier, by the equipment manufacturer
4 -- that we are obtaining with the other valve seismic
5 reports. I understand from others -- and this is not based
6 on any evidence that I have seen -- that those reports at
7 least tend to indicate that the valve would have to be
8 modified to comply fully with Seismic 1 requirements.

9 Q And that is the basis or at least part of the
10 basis for indicating on Table 1 that at the time of restat,
11 Three Mile Island Unit 1 will not fully comply with GDC 2?

12 A (WITNESS CAPODANNO) Yes.

13 Q And it is also your position that it need not
14 fully comply with GDC 2 prior to restart.

15 A (WITNESS CAPODANNO) Yes.

16 Q What is your basis for saying, then, that the
17 plant is safe enough to restart?

18 A (WITNESS CAPODANNO) The seismicity review that is
19 identified in both the TMI 1 and TMI 2 final safety analysis
20 reports indicates that the seismic loadings in the area of
21 the plant are significantly below, I think by a factor of
22 one-half, those used for design of this piping system and
23 the valves in particular. That is, I believe the historical
24 record shows the seismic loading to be .03 G; the operating
25 basis earthquake which is used for the design of this piping

1 system indicates a .06 G loading. Consequently, on that
2 basis alone, and the fact that the seismicity information
3 given in both of those final safety analysis reports covers
4 a period of some 200 years that we have small likelihood of
5 an earthquake of such magnitude that it would really affect
6 these valves. That is, historically there has not been an
7 earthquake of even the OBE magnitude; and secondly, the one
8 that has occurred, the greatest magnitude was only half of
9 that for which the valves were designed at operating basis
10 earthquake conditions. I think that that is my basis,
11 really, for making the comment.

12 Q So at least part of your basis, then, is your
13 assessment of the likelihood of such an earthquake.

14 A (WITNESS CAPODANNO) Both the likelihood and the
15 magnitude, yes.

16 A (WITNESS LANESE) I think there is another point
17 to that. We have not determined it clearly, but all of
18 those valves will function under the OPE earthquake
19 loadings. So the additional review that is under way now is
20 to be sure that they would not only stay -- we already know
21 they would stay intact for an SSE. We have to verify that
22 they would indeed function during an SSE.

23 A (WITNESS CAPODANNO) SSE being safe shutdown
24 earthquake.

25

1 MR. POLLARD: Mr. Chairman, I know we had an
2 extended break, but I would prefer to have our afternoon
3 break now.

4 CHAIRMAN SMITH: Okay.

5 MR. POLLARD: In fact, I have to.

6 CHAIRMAN SMITH: I will return at 3:15.

7 (Recess.)

8 CHAIRMAN SMITH: Mr. Pollard.

9 BY MR. POLLARD: (Resuming)

10 Q We will return now to page 3 of Table 1, Licensee
11 Exhibit 15, where you are discussing the extent of
12 compliance with general design criterion 4. Did I
13 understand you earlier that you are now unable to
14 demonstrate compliance with GDC-4 for a high energy line
15 break?

16 (Pause.)

17 A (WITNESS CAPODANNO) Is the question did we say we
18 are now able to comply with environmental conditions for
19 high energy break?

20 Q I was just trying to recall. Your earlier
21 testimony today, as I understood it, it was that at the
22 present time the emergency feedwater system equipment is not
23 environmentally qualified to withstand a high energy line
24 break in the intermediate building; is that correct?

25 A (WITNESS CAPODANNO) Not quite. I think what we

1 said is that there is a review going on, and without all the
2 results in we are not sure whether every component is or is
3 not qualified for those conditions.

4 Q So you are unable now to demonstrate that it is
5 qualified?

6 A (WITNESS CAPODANNO) That is correct, yes.

7 Q Do you know when or -- when will you be able to
8 make such a demonstration?

9 A (WITNESS CAPODANNO) I am not totally sure of
10 that, for the reason that in doing that review information
11 has been requested from equipment manufacturers and I really
12 do not know when each one of those is going to provide that
13 information.

14 Q But it's your position that it need not be done
15 prior to restart, is that correct?

16 A (WITNESS CAPODANNO) That is what we said, yes.

17 Q When did you discover this potential problem with
18 environmental qualification of emergency feedwater?

19 A (WITNESS CAPODANNO) It came out of the review
20 required by I&E Bulletin 79-01B.

21 Q When was that bulletin issued, approximately?

22 A (WITNESS CAPODANNO) I am sorry. Repeat the
23 question?

24 Q When was I&E Bulletin 79-01B issued?

25 A (WITNESS CAPODANNO) Some months ago. I am really

1 not sure of the date.

2 Q Does the 79 indicate it was some time in 1979?

3 A (WITNESS CAPODANNO) I believe it does, yes.

4 A (WITNESS LANESE) I can be more specific about the
5 timing of that, because I was involved in the identification
6 of the problem. It was approximately -- it was some time
7 this summer that we reviewed the blowdown data for the steam
8 line break accident inside the intermediate building and
9 determined that it was nonconservative with respect to our
10 plant design, and initiated a re-review and re-analysis of
11 the intermediate building environmental conditions. And
12 that was completed late August or early September, the
13 re-analysis was completed.

14 Q With reference to Remark C, page 2 of Table 1,
15 where you say, "Licensee has identified that a postulated
16 break in the main steam supply line to the emergency
17 feedwater pump turbine could whip and damage the common
18 emergency feedwater pumps discharge line," is it your
19 position that a break in the main steam line to the
20 emergency feedwater pump turbine is an accident you are
21 required to protect against?

22 A (WITNESS CAPODANNO) Yes.

23 Q And as I understand the further sentence in the
24 remark, "The Licensee is providing a rupture restraint to
25 protect the emergency feedwater line from the main steam

1 line prior to restart of Three Mile Island 1."

2 Am I correct that putting in restraints will not
3 preclude the break; it will just prevent the pipe from
4 whipping, is that correct?

5 A (WITNESS CAPODANNO) Yes.

6 Q Well, if we could still have the pipe break, then
7 you do not know or cannot demonstrate yet that the emergency
8 feedwater equipment can withstand that environment? What is
9 your basis for saying that the plant is safe enough to
10 restart?

11 A (WITNESS LANESE) I think it comes down to the
12 discussions we had this morning. It is not the situation
13 that any break of any size in the intermediate building is
14 going to disable the entire emergency feedwater system. The
15 previous analysis demonstrated that for a temperature
16 profile of something on the order of 320 or 330 degrees,
17 that the system would survive.

18 What we have seen is that under the new
19 assumptions for the guillotine rupture of the steam lines,
20 that the profile approaches 350 degrees for some period of
21 time. So again, the situation is that for most breaks the
22 equipment appears to be satisfactory. For the instantaneous
23 -- for the very sudden guillotine rupture, we have not been
24 able to demonstrate acceptability. And we do not believe
25 that that in itself is a significant risk for one-cycle

1 operation.

2 There is some other background to that also. I
3 believe -- it was before my time, but one of the licensing
4 bases for TMI-1 was that breaks in the intermediate building
5 were not postulated, because there was a requirement to do a
6 100 percent radiographic inspection of the steam line. So
7 the original licensing basis for the plant was that they
8 were -- breaks in that building were not likely.

9 Q But I keep recalling your testimony that you are
10 still in the process of completing your review of the
11 environmental qualification of emergency feedwater system
12 components, and you cannot now demonstrate that for the
13 range of breaks in the intermediate building, that for all
14 such breaks the emergency feedwater system will remain
15 operable; is that correct?

16 A (WITNESS LANESE) That is correct.

17 Q And is it correct that I&E Bulletin 79-01B covers
18 more in terms of environmental qualification than just
19 looking at high energy line breaks in the intermediate
20 building?

21 A (WITNESS CAPODANNO) Yes, I believe it does.

22 (Counsel for UCS conferring.)

23 Q Have you completed the reviews required by I&E
24 Bulletin 79-01BA

25 A (WITNESS CAPODANNO) I think I have to explain my

1 answer a bit.

2 Q Could you answer, please, yes or no, and then
3 explain it, please, if that is possible?

4 A (WITNESS CAPODANNO) I do not think it is, for
5 this reason. Some information has been obtained from which
6 you can draw conclusions. There is some information that
7 has not been obtained. A survey, if you will, a look at all
8 the equipment that is impacted by all the requirements has
9 been done.

10 Many of the vendors of that equipment have
11 provided the information. Others have not.

12 BY MS. WEISS:

13 Q Are you finished your answer?

14 A (WITNESS CAPODANNO) Yes.

15 Q Your answer, then, is no, you have not completed
16 the requirements of I&E Bulletin 79-01B?

17 A (WITNESS CAPODANNO) Yes, I agree with that.

18 Q Could you briefly explain what the I&E Bulletin
19 called on you to do? We will be going into more detail with
20 witnesses who are specifically talking about environmental
21 qualification.

22 A (WITNESS CAPODANNO) My understanding is the I&E
23 Bulletin applied to electrical equipment outside containment
24 and required a review of the capability of that equipment to
25 withstand environmental conditions, including high energy

1 line break and radiation.

2 Q I am sorry. Wasn't -- I thought you said outside
3 containment. Didn't it also apply to electrical equipment
4 inside containment?

5 A (WITNESS CAPODANNO) I do not believe it did.

6 Q Didn't that bulletin require you to identify -- to
7 come up with a master list of all electric equipment
8 required to be environmental qualified pursuant to GDC-4?

9 A (WITNESS LANESE) Can we go back for a second,
10 because I think you are correct in that it required that
11 equipment inside containment be considered. But the
12 requirement was that if -- rather, if there was an automatic
13 building spray initiation system, that the LOCA
14 environmental qualification was considered bounding by the
15 staff.

16 Q Okay.

17 A (WITNESS LANESE) So we made it in that sense. We
18 have LOCA qualified equipment, and that is still the most
19 severe environment for breaks inside containment.

20 Q Okay. But the question I am trying to establish
21 is, what were the requirements. And we will discuss later
22 in what way you met them or have not yet met them. But am I
23 correct that the bulletin, the first thing which the I&E
24 Bulletin required you to do was come up with a master list
25 of all equipment covered by General Design Criteria 4 which

1 is required to be qualified to withstand the accident
2 environment?

3 Whichever one of you knows the answer to that; if
4 Mr. Lanese does -- you might have indicated you had more
5 familiarity with the document.

6 A (WITNESS LANESE) I am not sure that I can
7 answer. I think I am generally familiar with 79-01B. I am
8 more familiar with the aspect I just discussed.

9 CHAIRMAN SMITH: I am having a hard time following
10 how this is related to emergency feedwater.

11 MS. WEISS: The implication of the table,
12 particularly page 2 of the table dealing with GDC-4, is that
13 the only problem with environmental qualification is this
14 high energy line break. It is my understanding that that
15 may be the only piece of equipment which has been
16 specifically identified to be unqualified, but they have not
17 yet been able to demonstrate or they have not completed
18 demonstrating along the broad range of equipment, but they
19 have documentation to prove that it is qualified.

20 That is the purpose of these questions.

21 MR. BAXTER: In the emergency feedwater system?

22 MS. WEISS: Yes.

23 CHAIRMAN SMITH: How did you get inside the
24 containment?

25 MS. WEISS: I got inside the containment because

1 the witness answered that the bulletin applied only to
2 outside the containment. It was my understanding it applied
3 to all electrical equipment. That was just a clarifying
4 question.

5 CHAIRMAN SMITH: All right.

6 BY MS. WEISS: (Resuming)

7 Q Let me ask you in summary fashion, if it is not
8 accurate that Met Ed has not yet been able to demonstrate
9 that all equipment required to be qualified under General
10 Design Criterion 4 is in fact qualified?

11 MR. BAXTER: Is the question limited to the
12 emergency feedwater system or the entire facility? If it is
13 the latter --

14 BY MS. WEISS: (Resuming)

15 Q Limited to emergency feedwater.

16 A (WITNESS CAPODANNO) In responding to 79-01B, I
17 think the answer is yes, we have not been able to
18 demonstrate full compliance with the requirements of that.
19 In regard to Criterion 4 which you mentioned, I just have
20 some trouble in that. I am not certain that one can say
21 that is a mandatory requirement on us or someone else, for
22 that matter. And the reason I am a bit hesitant is that, as
23 was mentioned by someone earlier, this plant was designed to
24 an earlier set of GDC's. These have come along after TMI
25 was licensed and operated.

1 Q Are you familiar with the Commission's decision
2 CLI-8021 and the DOE guidelines on environmental
3 qualifications?

4 A (WITNESS CAPODANNO) I don't believe I am, no.

5 Q We are going to get into that in detail, so, with
6 your explanation of why you qualified your answer, I think
7 that will suffice at this point and we will take up the
8 detailed questions with a witness who is more intimately
9 familiar with environmental qualifications.

10 BY MR. POLLARD: (Resuming)

11 Q Returning now to page 3 of Licensee Exhibit 15,
12 item 3 discusses the degree of compliance with General
13 Design Criterion 5. Am I correct that the principal reason
14 you have identified full compliance with this criterion is
15 that there really are no shared portions of the emergency
16 feedwater system?

17 A (WITNESS LANESE) That is correct.

18 Q As I understood it earlier, you did not include in
19 Table 1 general design criteria that were not applicable?

20 A (WITNESS CAPODANNO) As we explained, those we
21 felt that were not directly applicable to emergency
22 feedwater.

23 Q If you could just briefly tell me why GDC-5 is
24 applicable to the Three Mile Island Unit 1 emergency
25 feedwater systems, when those systems do not share any

1 components between Units 1 and 2?

2 A (WITNESS LANESE) I think there was an additional
3 reason why we put some of the GDC's in, namely that they
4 were referenced in the standard review plan, and GDC-5 was
5 specifically.

6 Q You are referring there to what section?

7 A (WITNESS CAPODANNO) 10.4.9.

8 Q Thank you.

9 On the next, item 4 discusses the degree of
10 compliance with General Design Criterion 19, which deals
11 with the control room. You talk about in your remark
12 communications between the alternate shutdown locations and
13 the remote shutdown panel. Now, this remote shutdown panel,
14 will that be completed prior to restart?

15 A (WITNESS CAPODANNO) First of all, I am not
16 certain that what you said is what we wrote.

17 Q All right. I am sorry. I tried to summarize, and
18 I shouldn't do that. Let me read what you wrote.

19 CHAIRMAN SMITH: Well, all right.

20 MR. POLLARD: It is my fault for trying to speed
21 things up, and I guess I just cannot do it.

22 CHAIRMAN SMITH: All right, go ahead.

23 BY MR. POLLARD: (Resuming)

24 Q "Means for controlling the emergency feedwater
25 system is provided in the control room. Alternate shutdown

1 locations for emergency feedwater control prior to
2 completion of the emergency feedwater control from the
3 remote shutdown panel will be located at the emergency
4 feedwater regulating valves. An improved and reliable
5 communications system between the control room and the
6 emergency feedwater regulating valve area will be provided
7 prior to restart of the TMI-1, which will allow the control
8 room operators to direct the operators stationed at those
9 valves."

10 My question was, in the second sentence where you
11 referred to "prior to completion of the emergency feedwater
12 control from the remote shutdown panel" -- my question was,
13 will that remote shutdown panel be completed or the control
14 of the emergency feedwater from that panel be completed
15 prior to restart?

16 A (WITNESS CAPODANNO) I do not think it will be. I
17 am not absolutely certain, however.

18 Q And what will be done from this remote shutdown
19 panel when it is completed? Under what conditions would you
20 be using it and what would be done at the remote shutdown
21 panel?

22 A (WITNESS CAPODANNO) There are a number of
23 instruments, such as steam generator level, reactor coolant
24 system instrumentation, that is included in this remote
25 shutdown panel to allow operation or shutdown of the plant

1 from outside the control room in the event of a control room
2 fire.

3 Q Am I correct that there will be some
4 instrumentation at the remote shutdown panel which is not
5 available at the regulating valves?

6 A (WITNESS CAPODANNO) Instrumentation in the panel
7 that is not --

8 Q That is not duplicated at the location of the
9 regulating valves?

10 A (WITNESS CAPODANNO) At the valves themselves,
11 yes, I believe that is correct.

12 Q Now, you say you are going to have an improved
13 communications system between the control room and the
14 regulating valve area; is that correct?

15 A (WITNESS CAPODANNO) Yes.

16 Q And do you recall that there will also be a
17 communications system between the control room and the
18 remote shutdown panel?

19 A (WITNESS CAPODANNO) I believe that is planned
20 also.

21 Q My question is, will there be direct communication
22 between the regulating valve area and the remote shutdown
23 panel?

24 A (WITNESS CAPODANNO) I really do not know the
25 answer to that.

1 Q Would you agree that in order to meet General
2 Design Criterion 19, such a communications system would be
3 required?

4 A (WITNESS CAPODANNO) I think when the remote
5 shutdown panel is completed, it will have the capability to
6 achieve the shutdown without the necessity of sending an
7 operator to the location of the valves to manually operate
8 them. And this improved communications system is defined as
9 something that will be used in the interim.

10 CHAIRMAN SMITH: What was your question, direct
11 communication?

12 MR. POLLARD: By that I meant instead of through
13 the control room.

14 (Counsel for UCS conferring.)

15 CHAIRMAN SMITH: It seems to me that I could
16 almost patch that up.

17 MR. POLLARD: If you wish to instruct Met Ed to
18 install such a communications system, I can stop this line
19 of questioning.

20 CHAIRMAN SMITH: I am just wondering if it is a
21 quibble or a serious safety concern.

22 MR. POLLARD: That is why I was consulting with
23 Ms. Weiss. We already have on the record emergency
24 procedures which indicate it is necessary at the time of
25 restart to communicate with both the regulating valve area

1 and the remote shutdown panel. And what I was trying to
2 explore with these witnesses was that if you lost access to
3 the control room you would not have this communication
4 link.

5 CHAIRMAN SMITH: All right.

6 (Counsel for UCS conferring.)

7 BY MR. POLLARD: (Resuming)

8 Q Are you aware that there are emergency procedures
9 which will be in effect for the plant design at the time of
10 restart which require communications between the control
11 room and the regulating valve area, as well as between the
12 control room and the remote shutdown panel?

13 A (WITNESS CAPODANNO) Not specifically aware of
14 those procedures, no.

15 Q Let's assume that that is the case, that there are
16 procedures which require communication between the control
17 room and the regulating valve area, and between the control
18 room and the remote shutdown panel. And as I understood
19 your earlier question, your earlier answer was that as far
20 as you knew there would be no direct communication at the
21 time of restart between the regulating valve area and the
22 remote shutdown panel.

23 Now, assuming that is correct, everything I have
24 just said, would you agree -- Mr. Lanese, are you shaking
25 your head at me or someone else?

1 MR. BAXTER: I will shake my head.

1 WITNESS CAPODANNO: There is something in there, I
2 am not sure I said it all.

3 BY MR. POLLARD: (Resuming)

4 Q Let me slow down. It is my fault again. One
5 thing at a time.

6 Let me postulate for you that there are emergency
7 procedures which require communication between the control
8 room and the regulating valve area, and then require also
9 simultaneously communications between the control room and
10 the remote shutdown panel.

11 A (WITNESS CAPODANNO) Okay.

12 Q Now, did you not just answer a previous question
13 of mine that at Three Mile Island you knew of no plans to
14 have direct communication between the regulating valve area
15 and the remote shutdown panel?

16 A (WITNESS CAPODANNO) I believe I said I am not
17 aware of any plans to do that, yes.

18 Q I believe you also said you would not need such
19 plans because when the remote shutdown panel is fully
20 revised, you can control the valves from there.

21 A (WITNESS CAPODANNO) Yes.

22 Q Okay. Now, my question is a hypothetical one.
23 That is, assuming that there is a need for communication
24 between the control room and the regulating valve area and
25 between the control room and the remote shutdown panel, and

1 that there is no direct communication between the regulating
2 valves and the remote shutdown panel, under those
3 conditions, would you agree that the design does not comply
4 with General Design Criterion 19 if you lose access to the
5 main control room?

6 (Pause.)

7 A (WITNESS CAPODANNO) I believe I would if your
8 assumption includes the fact that you had no control from
9 the remote shutdown panels for the valves that the operator
10 would be at.

11 Q And then one followup question. Is it your
12 position or Met Ed's position that the remote shutdown panel
13 must be fully modified prior to restart?

14 A (WITNESS CAPODANNO) I am not sure what fully
15 modified is intended to mean.

16 Q Well, I refer you back to your remark on Page 3 of
17 Table 1, where you said, "prior to completion of the
18 emergency feedwater control from the remote shutdown panel."
19 With respect to whatever you are referring to in your own
20 testimony, is it your testimony that those modifications or
21 completion must be done prior to restart or not?

22 A (WITNESS CAPODANNO) No, I believe we said we did
23 not feel that was the case.

24 Q With respect to your evaluation of the emergency
25 feedwater system using today's interpretation of the general

1 design criteria, do I understand your testimony and your
2 position to be that prior to the Three Mile Island Unit 2
3 accident, the emergency feedwater systems of Three Mile
4 Island Unit 1 were reliable, and you have made changes now,
5 and the emergency feedwater system is more reliable, but you
6 still don't meet some of the general design criteria at the
7 time of restart?

8 A (WITNESS CAPODANNO) I think we have stated yes,
9 that we have made these systems more responsive, more
10 timely, and that, yes, we have said under some conditions we
11 do not satisfy some of the requirements, that is, high
12 energy line break.

13 Q It was also your testimony that before you made
14 modifications, you had a reliable emergency feedwater
15 system. Is that correct?

16 A (WITNESS CAPODANNO) Yes, we did say that.

17 (Pause.)

18 Q I refer you now to the text of Licensee Exhibit
19 15, and first Item 3, which appears on Pages 1 and 2, and
20 more specifically the last paragraph of Section 3, which
21 appears on Page 2, that states that each motor-driven pump
22 discharges to a common discharge crosstie via check valves
23 and normally open valves.

24 Am I correct that if there is a break in a steam
25 line upstream of the main steam stop valve, that this could

1 lead to a severe overcooling event if emergency feedwater
2 flow into that steam generator were to continue?

3 (Pause.)

4 A (WITNESS LANESE) You said a break upstream of the
5 main steam isolation valve?

6 Q Yes, between the steam generator and the main
7 steam isolation valve.

8 A (WITNESS LANESE) A blowdown of one steam
9 generator essentially.

10 Q Yes.

11 A (WITNESS LANESE) Yes, that would be an
12 overcooling event, certainly.

13 Q Is this common discharge crosstie between the
14 pumps fully safety grade?

15 A (WITNESS CAPODANNO) I believe it is in the
16 context of the seismic design with some of the
17 qualifications that I mentioned earlier, and some of the
18 environmental qualifications that I mentioned earlier.

19 CHAIRMAN SMITH: Metal qualifications?

20 WITNESS CAPODANNO: Environmental qualifications.

21 CHAIRMAN SMITH: Oh, environmental.

22 BY MR. POLLARD: (Resuming)

23 Q How many switches -- let me slow down.

24 How do you detect a broken steam generator pipe
25 such as I have postulated for the purpose of isolating

1 feedwater flow to that steam generator?

2 A (WITNESS LANESE) On an individual steam generator
3 there are pressure switches which would detect low pressure
4 in the generator.

5 Q How many switches are there on each steam
6 generator?

7 A (WITNESS LANESE) I believe it is four per
8 generator.

9 Q Are those switches fully safety grade?

10 A (WITNESS LANESE) I cannot recall.

11 Q In preparing Exhibit 15, and Table 1, where you
12 attempt to evaluate the compliance of the emergency
13 feedwater system to the general design criterion, did you
14 not examine the switches?

15 A (WITNESS CAPODANNO) Yes, we did make a comment to
16 the effect on Page 11 of the text of the exhibit that
17 upgraded main steam rupture detection system to meet safety
18 grade requirements is one of the long-term modifications,
19 and the reason for that is the same issue of environmental
20 qualification.

21 Q And if these switches detect a low pressure in one
22 steam generator, what action results?

23 A (WITNESS CAPODANNO) They are suppose to isolate
24 feedwater to the affected steam generator.

25 Q By closing which valves?

1 A (WITNESS CAPODANNO) EFV 30 valves in the case of
2 emergency feedwater.

3 Q And if that valve fails to respond, then feedwater
4 would not be isolated. Is that correct?

5 A (WITNESS CAPODANNO) Emergency feedwater flow path
6 would still be open.

7 Q As I understood you earlier, you will not have
8 those cavitating venturis installed prior to restart. Is
9 that correct?

10 A (WITNESS LANESE) That is correct.

11 A (WITNESS CAPODANNO) That is correct.

12 Q Item 5 of your exhibit, which beings on Page 2, is
13 entitled Steam Supply for The Emergency Feedwater Turbine.
14 And you state in the last sentence of the first paragraph, "
15 "Also connected to the steam lines are the ICS controlled
16 atmosphere dump valves MSV 4A and B and main turbine bypass
17 valves."

18 Considering that the integrated control system
19 controls the atmospheric dump valves, is it possible for a
20 failure in the integrated control system to result in an
21 overcooling transient by signalling the dump valves to open
22 and remain open?

23 A (WITNESS LANESE) It would be possible for an ICS
24 failure to cause a dump valve on one steam generator to go
25 open.

1 Q How many dump valves are there per steam
2 generator?

3 A (WITNESS LANESE) One -- there are only two.

4 Q I did not know. That is why I asked.

5 Now, if a dump valve was fully opened, what effect
6 would this have on the pressure in the steam generator?

7 A (WITNESS LANESE) There would be a gradual
8 depressurization.

9 Q By gradual, how fast would the pressure drop and
10 to what pressure would it reach?

11 A (WITNESS LANESE) Well, it is only 3 percent steam
12 flow. So it would not be very rapid. If the turbine
13 controlled header pressure the way it normally does, there
14 would not be a depressurization of the steam generator.

15 Q Well, would the same -- What would happen to
16 steam generator pressure if the main turbine bypass valves
17 are stuck open?

18 A (WITNESS CAPODANNO) Maybe I should interject
19 something here. I see that you are questioning the
20 operation of these valves. There is another modification to
21 be made on these valves prior to restart which is going to
22 cause them to stay closed on an ICS failure.

23 In the case of the turbine bypass valves, they
24 will simply fail closed if there is an ICS failure. In the
25 case of the atmospheric dump valves, in addition to failing

1 closed on an ICS failure, a manual control for those valves
2 is also going to be provided, with the consequence that if
3 there is a failure in the ICS controls for these valves,
4 they will fail safe.

5 Q When you refer to ICS failures, at least in your
6 testimony last week, you were only referring to failures of
7 the pipe such as loss of power.

8 A (WITNESS CAPODANNO) That is correct, yes.

9 Q As I understood your testimony, you did not
10 evaluate the integrated control system for any other failure
11 mode?

12 A (WITNESS CAPODANNO) Again, let me explain. That
13 is correct, what you said about power failures in the
14 testimony I was giving last week. My understanding is,
15 however, that for the modification of these valves, it is
16 addressed to ICS failures, not specifically power supply
17 failures, but failures within the ICS.

18 Q Then it is your testimony that there is no
19 possible failure in the integrated control system that would
20 result in sending a signal to the atmospheric dump valves
21 and the main turbine bypass valves that would cause them to
22 go open?

23 A (WITNESS CAPODANNO) It is my understanding that
24 that is what the modification will achieve.

25 Q Did you personally do this evaluation?

1 A (WITNESS CAPODANNO) Not for these valves, no, sir.

2 A (WITNESS LANESE) I don't think Mr. Capodanno was
3 saying there would be a single failure that might cause one
4 turbine bypass or one atmospheric dump valve. I think he is
5 saying there is no common -- there is no failure that would
6 cause the opening of more than one valve. Or at least would
7 not cause the opening of the atmospheric dumps and the
8 turbine bypass valves.

9 BY MS. WEISS:

10 Q Is that what you meant, Mr. Capodanno?

11 A (WITNESS CAPODANNO) I think that is generally
12 correct. I am really not familiar enough with the details
13 of how this modification goes to provide those details.

14 Q Could you tell us where we can find a discussion
15 of this particular modification?

16 A (WITNESS CAPODANNO) I do not know that any such
17 description has been submitted.

18 Q Who told you about this modification?

19 A (WITNESS CAPODANNO) Discussion with
20 instrumentation and control engineers in our company.

21 Q Was that over the weekend?

22 A (WITNESS CAPODANNO) No, ma'am. It was done
23 several weeks before we got here.

24 Q Did they prepare a written document for you
25 describing the modification, or did they simply tell you

1 their conclusion about its results?

2 A (WITNESS CAPODANNO) I did not get a written
3 document. It was a verbal discussion.

4 Q Did they describe to you the modification or just
5 its results?

6 A (WITNESS CAPODANNO) They described what the end
7 results would be.

8 Q All right. So you cannot tell us today what this
9 modification will consist of?

10 A (WITNESS CAPODANNO) In detail, that is correct, I
11 cannot.

12 Q Can you tell us anything other than what you have
13 been told about what its results will be?

14 A (WITNESS CAPODANNO) Not really.

15 CHAIRMAN SMITH: The question was, can he tell
16 anything other than what he has been told?

17 MS. WEISS: What he has been told its results will
18 be.

19 DR. JORDAN: But I gather what you have been told
20 is that it will in a sense always be a safe failure, no
21 matter what the failure is. It will always be in such a
22 direction as to be safety grade -- be a safe operation.

23 WITNESS CAPODANNO: Yes.

24 DR. JORDAN: That, I guess, I have never been able
25 -- I have tried to design protection systems which fail safe

1 always, and it is a very, very difficult requirement, so I
2 guess I am interested in how one designs a piece of
3 equipment that will always fail safe, no matter how it
4 fails, whether it fails calling for an opening or calling
5 for a closure. It will always fail in the right direction.

6 WITNESS CAPODANNO: I think Mr. Lanese's
7 amplifying comment is what I intended, that we would not end
8 up with simultaneous failures with all the dump valves wide
9 open. There will be no relay or some such device that will
10 cause them all to go open simultaneously. I think in that
11 context fail safe is an appropriate term.

12 MS. WEISS: Mr. Chairman, I move to strike all
13 references to this modification. The witness has nothing
14 but the merest hearsay familiarity with it.

15 CHAIRMAN SMITH: You elicited the information in
16 cross examination.

17 MS. WEISS: Not until I got the answer to the last
18 question, can you tell us anything other than what somebody
19 told you.

20 CHAIRMAN SMITH: That was not your question.

21 MS. WEISS: Yes.

22 CHAIRMAN SMITH: As a matter of fact, I had a
23 question that I thought should be inserted here which would
24 include everything. Can you tell us anything more about the
25 valves and the fail safe features than what you have already

1 testified to?

2 WITNESS CAPODANNO: No.

3 CHAIRMAN SMITH: All right.

4 MS. WEISS: In light of that --

5 CHAIRMAN SMITH: Even in light of that, however, I
6 do not think you can strike the answer. I think you can
7 argue its weight, but it was an accurate answer to a
8 question you inquired about on cross examination. I am
9 certain that you will use it on proposed findings. No, it
10 is denied.

11 MS. WEISS: I think it is prejudicial to leave on
12 the record a reference to a system which we have been --
13 which this witness is not competent to testify to at all,
14 and I realize that I will be able to argue the weight, but I
15 just think that no reference should appear.

16 CHAIRMAN SMITH: I don't understand your concept
17 of cross examination, how you can spend all this time cross
18 examining the witness and then go through and pick and
19 choose the answers on cross examination which were
20 responsive to the questions.

21 Now, it would be another matter if you asked a
22 question and then he went on a venture of his own with
23 additional information, but that was not the case. You
24 asked the question. You got the answer.

25 MS. WEISS: I had to ask a series of questions

1 before I could draw it out of the witness that he had no
2 personal knowledge.

3 CHAIRMAN SMITH: Moreover, even -- well, your
4 motion is denied. It is denied.

5 BY MR. POLLARD: (Resuming)

6 Q When these four pressure switches monitoring steam
7 pressure monitor a depressurized steam generator, am I
8 correct that they are actually measuring pressure in the
9 steam generator and not differential pressure between the
10 steam generators?

11 A (WITNESS LANESE) That is correct.

12 Q In your --

13 DR. JORDAN: Could I inquire just a bit about
14 that? You measure the pressure in the steam generator, and
15 if the pressure falls below a certain point, then you close
16 the feedwater to that steam generator. Isn't that correct?

17 WITNESS CAPODANNO: Yes.

18 WITNESS LANESE: That is correct.

19 DR. JORDAN: Now, you say that you have more than
20 one pressure indicator, so that they are redundant, I
21 believe you said.

22 WITNESS CAPODANNO: There are four pressure
23 switches per steam generator.

24 DR. JORDAN: All right. In what sense are they
25 redundant? Are they redundant in that any one of those

1 pressure switches indicate -- indicating a low pressure
2 indicate the need for emergency feedwater?

3 WITNESS CAPODANNO: I believe it is a two out of
4 four logic. If any two out of four sense the low pressure,
5 then isolation will occur.

6 DR. JORDAN: I see. That helps.

7 BY MR. POLLARD: (Resuming)

8 Q When you say that any two out of the four sense
9 low pressure isolation would occur, what you really mean is,
10 a signal would be sent demanding isolation?

11 A (WITNESS CAPODANNO) Yes.

12 Q But since we have only one valve to accomplish the
13 isolation, it might not actually be accomplished?

14 A (WITNESS CAPODANNO) There are two valves.

15 Q There is only one valve per steam generator. Is
16 that not correct?

17 A (WITNESS LANESE) No, it is not.

18 Q Could you please tell me which valves are
19 signalled to close by the pressure switches?

20 A (WITNESS LANESE) Well, we were referring to main
21 or emergency feedwater. I am sorry, maybe I misunderstood
22 the question.

23 Q I am talking about emergency feedwater.

24 A (WITNESS LANESE) There is one valve in the
25 emergency feedwater system and two valves in the main

1 feedwater system that would receive a pressure signal in
2 each generator.

3 Q And the two valves in the main feedwater system
4 which are used to isolate feedwater flow, are those in
5 series or parallel?

6 A (WITNESS LANESE) They are in series.

7 Q All right. Which two valves are you referring
8 to? Are you referring to the main regulating valve and the
9 startup regulating valve?

10 A (WITNESS LANESE) No. They are the main
11 regulating valve, and the downstream block valve, and the
12 startup valve and its block valve also get a closure signal,
13 so really there are four.

14 Q Four valves?

15 A (WITNESS LANESE) Yes.

16 Q All right. That is four valves per steam
17 generator.

18 A (WITNESS LANESE) That is right.

19 Q In your evaluation for the design of Three Mile
20 Island Unit 1, did you agree that this plant is very
21 sensitive to overcooling transients?

22 A (WITNESS LANESE) I think its sensitivity to
23 overcooling has been somewhat exaggerated, but it is
24 sensitive to overcooling transients, yes.

25 Q Are you aware that NRC at one time considered

1 stopping construction of B&W plants after Three Mile Island
2 Unit 2 accident because of this extreme sensitivity, as they
3 phrased it, to overcooling transients?

4 A (WITNESS LANESE) No, I do not remember that.

5 CHAIRMAN SMITH: Are you leaving this subject
6 matter? Are you going to the next item?

7 MR. POLLARD: We are on the first paragraph, Page
8 5.

9 CHAIRMAN SMITH: I would like a short break before
10 you leave this subject matter.

11 (Pause.)

12 MS. WEISS: I should note for the record that we
13 are distributing to the parties and the Board a letter from
14 Harold Denton, director of the Office of Nuclear Reactor
15 Regulation, NSNRC, to Mr. S. H. Howell, vice president,
16 Consumers Power Company, dated October 25, 1979, Subject, 10
17 CFR 50.54 Request Regarding The Design Adequacy of Babcock
18 and Wilcox Nuclear Steam Supply Systems Utilizing
19 Once-Through Steam Generators (Midland Unit Numbers 1 and
20 2), and an attachment to that letter entitled Primary System
21 Perturbations Induced by Once-Through Steam Generator.

22 I would ask that that be marked at this time for
23 identification as UCS Exhibit 10.

24 (The document referred to
25 was marked for identification

1 as UCS Exhibit Number 10.)

2 MS. WEISS: Okay. I should also note, to be
3 accurate, that there are additional enclosures, one entitled
4 IREP-Initial Plant Study, and an Enclosure 3 entitled
5 Preliminary Identification of Systems and Components That May
6 be Impacted by Design Changes.

7 This document was provided to the Board members
8 previously, and --

9 MR. POLLARD: I should also add, Mr. Chairman, a
10 similar letter was served by the staff in this proceeding.
11 I did not use the letter the staff served because our copy
12 was not reproducible.

13 MR. CUTCHIN: Mr. Chairman, I am having difficulty
14 identifying the enclosures as the enclosures referred to,
15 because some of the words are cut off at the top of the
16 first page of the attachments. Could UCS spokesmen please
17 give some more identifying words on the first so I can be
18 assured that I have the appropriate attachments?

19 MS. WEISS: The first enclosure is entitled
20 Primary System Perturbations Into Once-Through Steam
21 Generator.

22 MR. CUTCHIN: Fine.

23 MS. WEISS: Is that all?

24 MR. CUTCHIN: That is all I need on Page 1, but
25 when I go back, the pages are not numbered.

1 MS. WEISS: As Mr. Pollard said, this is a copy of
2 a staff document, and to my knowledge, the pages of the
3 enclosures were not numbered.

4 MR. CUTCHIN: Where does Enclosure 2 start?

5 MS. WEISS: Enclosure 2 starts four pages from the
6 end.

7 MR. CUTCHIN: Could the UCS spokesman identify --

8 MS. WEISS: That is entitled IREP-Initial Plant
9 Study. Enclosure 3 is the last page.

10 MR. CUTCHIN: That is sufficient, Mr. Chairman.
11 Thank you.

12 MR. BAXTER: The representation is, all enclosures
13 were sent with this letter?

14 MS. WEISS: Yes. The text of this letter to a
15 different addressee, another B&W plant with all of the
16 enclosures was served on all the parties in this case some
17 time ago.

18 CHAIRMAN SMITH: This case?

19 MS. WEISS: This case, yes, by staff, I assume as
20 part of its information dissemination function. And we did
21 not copy that one because the reproduction, the quality was
22 so bad, it was not reproducible. So, we went to the public
23 document room and got another one.

24 CHAIRMAN SMITH: That is an interesting
25 observation. I do not recall having seen this before.

1 Moreover, I was the chairman of the Operating License Board
2 at Midland when this letter was issued, and I do not think I
3 received it in that case either. And the service list does
4 not indicate me.

5 Are you confident that we received this in this
6 case?

7 MS. WEISS: Yes. We received another copy of the
8 text to a different addressee.

9 MR. POLLARD: Tomorrow morning I will bring you in
10 the letter which the staff served in this proceeding. I
11 don't know what happened in the Midland proceeding.

* 12 MR. CUTCHIN: I am not challenging the
13 authenticity, Mr. Chairman. I just wanted to make sure I
14 had the appropriate pages.

15 MS. WEISS: I note that the letter notes on Page
16 3, the fourth paragraph from the end of the letter, it says,
17 "We are sending similar letters to all utilities holding
18 construction permits for plants with B&W nuclear steam
19 supply systems."

20 BY MR. POLLARD: (Resuming)

21 Q Mr. Lanese or Mr. Capodanno, have either of you
22 had occasion to review either this letter or any of the
23 other similar letters which went to the other Babcock and
24 Wilcox construction permit holders?

25 A (WITNESS CAPODANNO) I have not.

1 A (WITNESS LANESE) No. I have not, either. What I
2 have seen, I believe, is some of the subsequent staff
3 discussion in, I believe it is NUREG-0667.

4 Q If I could direct your attention, please, to
5 Enclosure 1, a section which begins on the fifth page of
6 Enclosure 1, captioned IV, Role of ICS-MFW, could you read
7 that entire section, please, to yourself, which terminates
8 in the middle of the next page?

9 MR. BAXTER: Mr. Chairman, there is no question
10 posed yet, but I am going to have a problem. Neither
11 witness has read this document before. Having them review
12 isolated sections, having them respond to questions without
13 having them read the full piece -- It is not a document they
14 have prepared. They have just been handed it.

15 CHAIRMAN SMITH: I am not aware of any rule of
16 cross examination that would prevent them from examining
17 them on a portion of a document. The examination, of course
18 -- I mean, it is going to have to be definite as to what
19 language they are being examined on, but perhaps if there is
20 going to be much examination on this document, we had better
21 defer it until tomorrow and go to something else so that
22 they can familiarize themselves with it.

23 MR. POLLARD: My goal, first of all, was to
24 hopefully complete these witnesses today, but we could
25 always change that. Also, as Ms. Weiss points out, I could

1 perhaps ask these questions without reference to any
2 document.

3 CHAIRMAN SMITH: Yes.

4 MR. POLLARD: If the witnesses are unable, or they
5 choose to wish to read the whole document overnight, that
6 would also be fine with me.

7 CHAIRMAN SMITH: I think that the --

8 MR. BAXTER: Perhaps I need to wait and hear the
9 first question.

10 CHAIRMAN SMITH: The approach you are taking of
11 examining them on the points of Item IV when they have it
12 before them has a better assurance of avoiding confusion
13 than if you were to just propound questions to them. Let's
14 give them plenty of time to read the section.

15 MR. POLLARD: Certainly. The reason we went here
16 was, we were just talking about the integrated control
17 system and its effect on feedwater, and that is why I am
18 focusing on this section of the letter.

19 MR. BAXTER: We were talking on emergency
20 feedwater and the integrated control system.

21 MR. POLLARD: And the witnesses also mentioned
22 that there are valves controlled also in the main feedwater
23 system.

24 MS. WEISS: Just let us know when you are --

25 MR. POLLARD: Tell us whenever you are finished

1 studying Section IV and as much of the letter as you choose
2 to. I am only going to ask a few questions on Section IV.

3 (Pause.)

4 BY MS. WEISS: (Resuming)

5 Q Are you ready?

6 A (WITNESS LANESE) Yes.

7 BY MR. POLLARD: (Resuming)

8 Q The second sentence in Section IV states,
9 "However, review of operating experience suggests that the
10 integrated control system often is a contributor to
11 feedwater transients."

12 Have either of you done any review of the
13 operating experience at B&W plants to be able to agree or
14 disagree with that sentence?

15 A (WITNESS LANESE) Yes, I have seen some other B&W
16 plant data with respect to overcooling events.

17 Q And so that data would lead you to agree with that
18 sentence?

19 A (WITNESS LANESE) Yes, I agree that the ICS is
20 usually a contributor to overcooling events.

21 Q The next sentence reads, "In some cases, the ICS
22 appeared inadequate to provide sufficient plant control and
23 stability."

24 From the review that you have done, would you
25 agree with that sentence?

1 MR. BAXTER: Mr. Chairman, I object as to the
2 relevancy of the questioning. As I understand it, we are
3 dealing with a Board question on the reliability of the
4 emergency feedwater system at TMI 1. We do have an upcoming
5 issue on ICS, its failure modes and effects, but I do not
6 see how this relates to the testimony of the witnesses.

7 MR. POLLARD: Mr. Chairman, in judging the
8 reliability of the emergency feedwater system, I think it is
9 important to have an understanding of how often the
10 emergency feedwater system might be called upon to operate.
11 In this particular case, the integrated control system does
12 in fact contribute to feedwater transients for which then
13 the emergency feedwater system may need to be relied upon.

14 CHAIRMAN SMITH: In the direction of overcooling?
15 Don't forget, the witness's agreement with you was that the
16 ICS offers a contributor to feedwater transients of
17 overcooling. And they did not agree with your entire
18 sentence.

19 MR. POLLARD: The sentences that he agreed with,
20 the first two sentences are not limited to just overcooling
21 transients.

22 CHAIRMAN SMITH: His agreement with you was
23 limited.

24 MR. POLLARD: I am sorry. I missed that
25 distinction.

1 CHAIRMAN SMITH: Maybe I am wrong. Am I right?
2 Your answer seemed to be limited. The question to you was,
3 do you agree with the sentence that ICS is often a
4 contributor to feedwater transients, and your answer was,
5 yes, studies show that ICS is a common contributor to
6 overcooling transients.

7 WITNESS LANESE: That is correct.

8 CHAIRMAN SMITH: What is correct?

9 MR. POLLARD: Then I asked him, did he agree with
10 the next sentence, to which I don't think I got that
11 qualification.

12 CHAIRMAN SMITH: Well, all right. Even so, that
13 is an extremely broad sentence, and I think --

14 MR. POLLARD: I am only responding to Mr. Baxter's
15 objection as to the relevancy of this question. I tried to
16 explain the relevancy being evaluating the reliability of
17 emergency feedwater.

18 CHAIRMAN SMITH: So far, I cannot see how you have
19 linked a challenge to emergency feedwater to the answers
20 provided by this witness. I am seeking to be corrected,
21 though, on it if I am wrong.

22 DR. JORDAN: Since the witness says it was an
23 overcooling event which would not require emergency
24 feedwater, that was my conclusion, that it did not require
25 emergency feedwater.

1 BY MS. WEISS: (Resuming)

2 Q Was that the purpose of your answer? Was that the
3 reason why you answered the question the way you did?

4 A (WITNESS LANESE) I understood the nature of this
5 question to be with respect to overcooling transients.

6 However, I would agree that most of the problems that I have
7 seen with ICS is in overcooling events rather than loss of
8 feedwater events when there have been problems with the ICS.

9 BY MR. POLLARD: (Resuming)

10 Q At Three Mile Island Unit 1, is it possible for
11 the ICS to cause failures in the main feedwater system which
12 might result in the need for emergency feedwater?

13 A (WITNESS LANESE) ICS cannot interrupt main
14 feedwater to both steam generators without multiple failures.

15 Q Well, once again, have you personally evaluated
16 the integrated control system?

17 A (WITNESS LANESE) No, other members within the
18 control room safety analysis group at GPU have. And I work
19 with them on a daily basis.

20 CHAIRMAN SMITH: You see, this is where we are
21 going here.

22 MR. POLLARD: Okay. I will stop. We can go on.

23 CHAIRMAN SMITH: All right. I indicated we wanted
24 to make a comment before you leave this narrower subject
25 matter.

1 (Pause.)

2 MR. POLLARD: Mr. Chairman, we have no further
3 questions on Section IV of this particular document.

4 CHAIRMAN SMITH: All right.

5 MS. WEISS: That is the end of this paragraph.

6 CHAIRMAN SMITH: Then we are going back to your
7 examination of the witness on the question of the dump
8 valves and the fail safe -- fail safe features of them
9 collectively. Although we would not grant your motion to
10 strike, we did indicate that there was a question of, was
11 that reliable, and we do not believe the way the record
12 stands now that his judgment that that is the case is --
13 meets the test of reliability that we need.

14 We could go in another direction to see if he
15 received the information under circumstances conducive to
16 reliability or we could go directly to a better source of
17 information. I think the latter would be preferable.

18 So, the Board would like to have some better
19 evidence on the subject, on the information that he received
20 leading him to that conclusion.

21 MR. BAXTER: We believe that our witnesses who
22 will be testifying on the integrated control system issue
23 will be able to address that.

24 CHAIRMAN SMITH: Okay, but is that going to do it
25 as far as the --

1 MS. WEISS: We are not going to -- I was just
2 going to point out that that is not one of our -- that ICS
3 is not one of our contentions. If we could just know where
4 in the restart report or in any of the documents this
5 modification is discussed -- I don't care if the witness
6 tells me that or Mr. Baxter tells me that -- and then maybe
7 the next point is, how do we get some testimony on.

8 CHAIRMAN SMITH: In the meantime, that would be
9 fine if it could be done, but the Board can ask the
10 questions on this issue when ICS testimony comes.

11 MS. WEISS: Yes, sure. I would just like to know
12 if he could tell me today or some time before I leave what
13 section in the restart report or whatever or any other
14 document you describe this modification that Mr. Capodanno
15 was alluding to.

16 MR. BAXTER: I certainly cannot off the top of my
17 head. I don't know that I have the people here to answer
18 that question either. Before Thanksgiving, certainly.

19 BY MR. POLLARD: (Resuming)

20 Q On Page 3 of Licensee Exhibit 15, the paragraph
21 just preceding the beginning of Section 6, the final
22 sentence reads, "The turbine exhaust is vented directly to
23 the atmosphere."

24 Am I correct there that you are referring to the
25 steam exhaust from the turbine driven emergency feedwater

1 pump?

2 A (WITNESS CAPODANNO) Yes.

3 Q Then therefore whatever level of radioactivity
4 might be in the steam would be vented directly to the
5 atmosphere. Is that correct?

6 A (WITNESS CAPODANNO) Yes.

7 Q Is there any protection that would isolate the
8 exhaust or the supply to the emergency feedwater turbine
9 driven pump if the level of radioactivity in the steam
10 became excessively high?

11 A (WITNESS LANESE) In developing the abnormal
12 transient operating guidelines for Arkansas, B&W identified
13 that path as a potential source of radioactivity releases.
14 At present, we have increased the operator awareness
15 procedurally that that source of steam is a potential source
16 of radioactivity.

17 We also have main steam line radiation detectors
18 that have been added as a result of that consideration so
19 that the operator would be able to determine if, say, he is
20 supplying the steam to the emergency feedwater turbine
21 driven pump from the A steam generator, and the A steam
22 generator had high activity levels. He would recognize
23 procedurally that he should isolate that generator and
24 attempt to supply steam from the B generator.

25 Q This radiation detector on the steam line, would

1 that detect an increase in radiation level in the steam
2 which occurred after the main steam isolation valve was
3 closed?

4 In other words, let me rephrase it for you. The
5 steam traveling from the steam generator to the emergency
6 feedwater pump turbine, would it pass by this radiation
7 detector if the main steam isolation valve was closed?

8 A (WITNESS LANESE) I cannot say definitively. As
9 you are probably aware, though, the main steam isolation
10 valves are nearly into the turbine building. I would not
11 see the benefit in having put the radiation monitors in the
12 turbine building.

13 Q Well, the only reason I asked the question, you
14 indicated that, if I understood you correctly, the operator
15 would use this radiation monitor, and if he saw an increase
16 in the radiation level, he would isolate the steam to the
17 emergency feedwater pump turbine. Is that correct?

18 A (WITNESS LANESE) Yes.

19 Q So I am simply askink the question, if the main
20 steam isolation valve is closed, would the steam traveling
21 from the steam generator to the emergency feedwater pump
22 turbine pass by this detector?

23 A (WITNESS LANESE) Since that is one of the
24 purposes of the detector, I can only say I assume so.

25 Q You assume so. But then you rely upon the

1 operator to do it. There is no automatic function.

2 A (WITNESS LANESE) That is correct.

3 Q Is this described in the Three Mile Island Unit 1
4 emergency procedures, this function for the operator to
5 isolate emergency feedwater turbine driven pump, to your
6 knowledge?

7 A (WITNESS LANESE) I do not know if it has already
8 been included in the procedures or if it is still under
9 review. The recommendation from technical functions group
10 is that it should be included in those procedures, and in
11 fact, when we had an emergency preparedness drill in which
12 we came across that situation, we did alert the operators to
13 the need to monitor steam from the turbine driven emergency
14 feedwater pump.

15 So, there is a general awareness with the power
16 companies that that is a necessity.

17 Q If I understood you correctly, Mr. Lanese, you do
18 not know whether it is now in the emergency procedures or
19 not.

20 A (WITNESS LANESE) That is correct.

21 Q You do not -- I don't like to give you too many
22 questions to do on breaks, but could you try and find out if
23 it is now in the emergency procedures and tell me which
24 procedures it is in? Overnight, perhaps?

25 MR. BAXTER: We can certainly make the procedures

1 available to you, Mr. Pollard. I don't know whether Mr.
2 Lanese will have time to research them or not. Would you
3 even have a close idea of where to look?

4 WITNESS LANESE: I would have to go back to the
5 home office and ask someone if they could verify it for me.

6 MR. BAXTER: We will take the request under
7 advisement.

8 MR. POLLARD: I am not trying to make a great deal
9 of work. I know we already have some emergency procedures
10 on the record which deal with emergency feedwater, and I do
11 not recall seeing this in those procedures. That was the
12 reason for my question.

13 (Pause.)

14 BY MR. POLLARD: (Resuming)

15 Q If you could turn to Page 7 of Licensee Exhibit
16 15, particularly Item 6 -- I am sorry. I have a typing
17 error in my cross examination plans. I guess I mean to
18 refer to Item 7 on Page 7.

19 I did have a typing error, but it was not the
20 item, it was the system. In Item 6, you are talking about
21 there the level transmitted on the condensate storage tank
22 which will give the operator an alarm before the water level
23 in the tanks becomes too low. Is that correct?

24 A (WITNESS CAPODANNO) This is Item 6?

25 Q Item 6, Page 7, yes.

1 A (WITNESS CAPODANNO) Okay.

2 Q Is that alarm at the time of restart safety grade?

3 A (WITNESS CAPODANNO) No.

4 Q But in the long term you are going to make it
5 safety grade?

6 A (WITNESS CAPODANNO) Yes.

7 Q In what way is it now not safety grade?

8 A (WITNESS CAPODANNO) The current design for
9 restart incorporates a common power supply and also it is
10 not redundant in the sense that the final indicating
11 element, the annunciator is a common device for both
12 condensate storage tanks.

13 Q Now, we are in the section of your exhibit which
14 talks about those modifications which will be completed
15 prior to restart, and when you introduced this exhibit, as I
16 understood it, you changed the second sentence of Item 6 to
17 read, "A common annunciator window will be provided for the
18 CSP 10-10 level alarms."

19 You are saying at the time of restart that is what
20 is wrong with it. It will still have the common annunciator.

21 A (WITNESS LANESE) Did you say that is what is
22 wrong with it?

23 Q Excuse me. That is why it is not safety grade.

24 A (WITNESS CAPODANNO) Yes, that is correct.

25 Q I did not mean to imply there was anything wrong

1 with it.

2 Now, if you are eventually going to change this so
3 that this alarm is essentially made safety grade, what is
4 your basis for saying that it is safe to restart the plant
5 with the common annunciator?

6 A (WITNESS CAPODANNO) I believe that this alarm is
7 useful in the sense that it will provide a minimum 20-minute
8 warning. However, there are other alarms currently on the
9 tanks designated as the tech spec or level limit alarms that
10 are redundant, and I would look upon this in the short term
11 as an adequate modification since it will be a conservative
12 design and if all the parts are operated, you will get a
13 20-minute warning. If less than all three are operating,
14 you will get more than a 20-minute warning.

15 It is a backup to an existing alarm and for those
16 reasons the operator will be aware of changes in tank level
17 from both alarms.

18 Q Are these other alarms, are they safety grade
19 prior to restart?

20 A (WITNESS CAPODANNO) I believe they are.

21 Q If the other alarms which now exist at least are
22 safety grade, why in the last half of Item 6 on Page 7 do
23 you say a qualified level transmitter, one per tank, and
24 associated alarm hardware will be added as a part of the
25 long-term modifications?

1 A (WITNESS CAPODANNO) In the long term, the plan is
2 to provide this 20-minute level alarm on a per tank basis,
3 and to do that with components that are qualified to satisfy
4 the definition of safety grade equipment.

5 Q Okay. The existing alarms, I assume, have
6 associated with them some type of level transmitter or
7 switch. Is that correct?

8 A Yes, they do. You are talking about the tech spec
9 alarm, I assume.

10 Q Yes.

11 A (WITNESS CAPODANNO) Yes.

12 Q Are those level transmitters fully qualified in
13 the sense that you say a qualified level transmitter will be
14 added?

15 A (WITNESS CAPODANNO) I would say I am not certain,
16 and the reason I am not certain is that they were most
17 certainly purchased and installed prior to the time of
18 issuance of the current criteria. That is the current IEEE
19 standard which is being used for the new equipment.

20 Q So then it would be fair to say that you do not
21 know whether the level transmitters which will be there at
22 the time of restart are safety grade or not.

23 A (WITNESS CAPODANNO) I believe they will be safety
24 grade from the standpoint that the environment that they are
25 in, they are designed to work. In terms of the current IEEE

1 standard -- I believe it is 1974 edition of IEEE 232 --
2 there are some aging requirements for components that we are
3 trying to comply with. We make several utilites -- the
4 equipment manufacturers are trying to comply with them, and
5 from that standpoint, we think that definition, those
6 components will be safety grade in the context of the
7 standard I just mentioned.

8 In the context of what has been in the plant, to
9 my understanding, it was designed to survive in the
10 environment it will be in, I think it will be adequate, and
11 the medium then for providing a reliable indication.

12

15
16
17
18
19
20
21
22
23
24
25

1 (Pause.)

2 Q Wouldn't it be reasonable to conclude from your
3 exhibit that the reason you are adding a qualified level
4 transmitter is that the existing level transmitters either
5 are not qualified or you are unable to demonstrate that they
6 are qualified?

7 A (WITNESS CAPODANNO) First of all, I think we have
8 to make a distinction. There are level transmitters on the
9 tank, and there are level switches. I believe the tech spec
10 alarm comes off the switch. The normal tank indication
11 comes off a transmitter. The transmitter is informational
12 input. I don't think there is any attempt to make that
13 safety grade as I define the conditions for the switch. I
14 believe the switch is safety grade.

15 Q So then with respect to your review for I&E
16 Bulletin 7901B, are you saying you completed your
17 investigations required by that bulletin for the existing
18 switches?

19 A (WITNESS CAPODANNO) I am really not sure if those
20 switches are covered in that bulletin.

21 Q But it is your testimony that you are relying on
22 these switches as a basis for restart without a fully
23 qualified level transmitter?

24 A (WITNESS CAPODANNO) Again, the tech spec level
25 switches is what we are discussing?

1 Q Yes, sir.

2 A (WITNESS CAPODANNO) I said that the -- they
3 provide an indication along with this 20-minute warning
4 alarm, and have been there for use all along.

5 Q Okay. Let me see if I can review for you the line
6 of questioning and as I understood your answers. I asked
7 you, eventually, you are going to install a qualified level
8 transmitter and the associated alarm hardware, but that
9 would not be done prior to restart, and then I asked you, if
10 that is not going to be done prior to restart, what is your
11 basis for assuming the plant is safe enough to restart? And
12 your answer to me to that question was to point to these
13 tech spec switches.

14 Then we explored the condition, are the tech spec
15 switches qualified, and I further asked you whether you had
16 completed your review required by Bulletin 7901B for those
17 switches, and you did not know whether the Bulletin covered
18 those switches. So, that brought us full circle to where my
19 question now is, if you are going to use the tech spec
20 switches as your basis for restart, wouldn't you agree that
21 they should be reviewed under I&E Bulletin 7901B?

22 A (WITNESS CAPODANNO) Well, again, a terminology
23 problem. I do not believe I said that the tech spec
24 switches were an absolute substitute for the 20-minute
25 alarm. I said I felt they worked in parallel with the alarm,

1 and provide an additional means of indication, and that was
2 my justification for saying that in the short term, I did
3 not feel we needed a higher qualified 20-minute alarm. That
4 is planned for the long term.

5 Q Is it your general proposition, then, that two
6 alarms, neither of which is safety grade, can compensate for
7 the absense of an alarm of a single transmitter which is
8 safety grade?

9 A (WITNESS CAPODANNO) Again, we said some time ago
10 that safety grade we define in terms of the function it was
11 trying to provide. I believe that the tech spec alarm in
12 the environment it is in and the function it is trying to
13 provide is safety grade. a

14 Q What criteria do these tech spec level switches
15 meet as a basis for you stating your belief that they are
16 environmentally qualified?

17 A (WITNESS CAPODANNO) There is one per tank, so
18 they provide redundancy. I believe the wiring for them is
19 run separately.

20 Q Excuse me. I asked specifically what criteria do
21 they meet as the basis for your conclusion that you think
22 they are environmentally qualified.

23 A (WITNESS CAPODANNO) Okay. My understanding is
24 that they are qualified for the outdoor environment where
25 they are located.

1 Q And what standard or criteria did you use as a
2 basis for deciding that they are qualified?

3 A (WITNESS CAPODANNO) My criteria or standard is
4 that they are designed to survive in the environment in
5 which they are located.

6 Q Were they tested to see if they would?

7 A (WITNESS CAPODANNO) They were purchased some time
8 ago. I really could not tell you under what particular
9 tests they were tested.

10 (Pause.)

11 Q Am I correct that what your testimony means is
12 that you are aware that when these tech spec level switches
13 were purchased, the purchase order specified that they
14 should operate in their environment satisfactorily, but that
15 you do not really know whether any testing was done or any
16 particular IEEE standard was applied to determine whether or
17 not that purchase specification requirement was adequately
18 fulfilled?

19 A (WITNESS CAPODANNO) I have not reviewed any such
20 test results. That is correct.

21 BY MS. WEISS: (Resuming)

22 Q And in fact, you don't know whether such testing
23 was done?

24 A (WITNESS CAPODANNO) Again, I think the same
25 answer I gave earlier. I have not specifically reviewed

1 test reports.

2 Q And in fact you do not know whether such reports
3 exist. Is that correct?

4 A (WITNESS CAPODANNO) I could not swear that they
5 exist. That is correct.

6 BY MR. POLLARD: (Resuming)

7 Q If I could direct your attention now to Item 3 on
8 Page 9 of Licensee Exhibit 15, entitled Reduction of The
9 Possibility of OTSG, Overcooling and Overfill Condition,
10 please explain why overcooling and overfill conditions are
11 of concern.

12 A (WITNESS LANESE) Overcooling is considered an
13 item of design concern because it ultimately can result in a
14 loss of pressurizer level and or initiation of high pressure
15 injection on a 1,600 pound reactor coolant system pressure
16 and subsequent to that the operator is required to then
17 verify that he has an adequate subcooling method and
18 throttle high pressure injection.

19 As far as overfilling, I think the concern has to
20 be evaluated on a plant by plant basis. Generically, the
21 concern is putting water in the steam lines could have an
22 effect on the steam lines. The lines may not be designed
23 without additional blocking to tolerate the dead weight of
24 the water in the lines, or there may be water hammer effects
25 resulting from the steam-water mixture.

1 Q So the ultimate concern might be rupture of the
2 steam line?

3 A (WITNESS LANESE) That is the generic concern.
4 That is right.

5 Q Do these generic concerns apply to Three Mile
6 Island Unit 1 with respect to overfilling?

7 A (WITNESS LANESE) My understanding is, we have
8 completed our -- our stress group has completed an
9 evaluation of the steam lines and concluded overfilling of
10 the lines would not result in any failures.

11 Q Then why are you engaged in reducing the
12 possibility of overfill conditions?

13 A (WITNESS LANESE) It is a plant operational
14 concern at a minimum. SMUD had such a situation, and they
15 required three or four day shutdown at least while they
16 re-analyzed the event and reported it and verified that,
17 yes, indeed, they were suitable -- the plant was in a
18 suitable condition to restart.

19 Q You are using this as an example of why you are
20 pursuing reductions of overfill conditions at Three Mile
21 Island Unit 1, that you would not want to have to go through
22 such analyses?

23 A (WITNESS LANESE) That is at least one example,
24 certainly.

25 Q Are there other examples?

1 A (WITNESS LANESE) Well, in general, in an overfill
2 situation, it is something that is not supposed to happen in
3 the plant. You are -- I guess it is really the same example.

4 Q Have you made any changes at Three Mile Island
5 Unit 1 to reduce the instances of overcooling caused by main
6 feedwater?

7 A (WITNESS LANESE) We have spent a reasonable
8 amount of time now with B&W re-evaluating plant data with
9 respect to looking at overcooling events from main
10 feedwater. We have revised our procedures, and our
11 conclusions along with B&W are that for feedwater
12 temperatures over approximately 300 degrees, that
13 overcooling as a result of addition of main feedwater is not
14 a concern.

15 While you may overfill, you will not see a
16 substantial overcooling of the reactor coolant system.
17 Again, as a result of some of those studies, the technical
18 functions group of GPU has made recommendations to the plant
19 regarding revision of procedures. I do not believe those
20 procedures have been fully implemented yet.

21 Q Have there been any changes made to hardware to
22 reduce the instances of overcooling caused by main feedwater?

23 A (WITNESS LANESE) In the long term, we have the
24 commitment to isolate main feedwater on steam generator
25 level of 82 and a half percent in the operating range.

1 Q Have there been any changes -- Let me ask a first
2 question. Is it possible for failures in the integrated
3 control system to cause overcooling?

4 (Pause.)

5 A (WITNESS LANESE) As I said with respect to main
6 feedwater, we have determined that main feedwater really is
7 not a source of overcooling.

8 Q What about with respect to emergency feedwater?

9 A (WITNESS LANESE) Emergency feedwater? If there
10 were a failure to throttle emergency feedwater after it
11 reached its desired level set point, you would overcool the
12 plant. That is correct.

13 CHAIRMAN SMITH: Overfill the what?

14 WITNESS LANESE: Overcool the reactor coolant
15 system.

16 BY MR. POLLARD: (Resuming)

17 Q Do you know of any changes that have been made to
18 prevent ICS failures which can cause these kinds of
19 overcooling events?

20 A (WITNESS LANESE) I think those changes would be
21 in the availability of power supplies, both the hand and
22 auto power supplies, and ultimately the independent
23 controller for NSS and emergency feedwater. In the long
24 term, of course, we will be independent of the ICS and the
25 cavitating venturis will also limit the potential for

1 overcooling.

2 Q Is there any schedule now for how long the long
3 term is?

4 A (WITNESS LANESE) I believe long term means the
5 first refueling outage following restart.

6 CHAIRMAN SMITH: And that would be, inasmuch as
7 you were down for a refueling, that would be a four-year --
8 or how long would that be?

9 WITNESS LANESE: Approximately a 12-month fuel
10 cycle. Twelve months from the time we restarted the plant.

11 BY MR. POLLARD: (Resuming)

12 Q On Page 10 of Licensee Exhibit 15, and continuing
13 on Page 11, how many of the items identified as 1 through 8
14 will be done prior to restart, and which ones?

15 A (WITNESS CAPODANNO) Item 1, safety grade
16 automatic system start, will be achieved prior to restart.
17 Item 2, system flow indication in the control room, the
18 parenthetical note indicates that it will be done as a
19 restart modification.

20 Your question was, which ones will be done prior
21 to restart?

22 Q Yes.

23 A (WITNESS CAPODANNO) Items 1 and 2, prior to
24 restart as safety grade.

25 Q Oh. Are you done? All the rest will not be done

1 prior to restart?

2 A (WITNESS CAPODANNO) They are not being done as we
3 have identified previously prior to restart as fully safety
4 grade in every instance, or some of these are identified as
5 solely long-term modifications.

6 Q When you said that Number 1 would be done prior to
7 restart, were you referring there solely to the automatic
8 initiation from loss of reactor coolant pumps and loss of
9 main feedwater pumps, but you were not referring to the
10 other automatic initiation functions of low steam generator
11 level, and --

12 A (WITNESS CAPODANNO) The other signal would be
13 feed steam delta p.

14 A (WITNESS LANESE) The answer is, yes, I was
15 referring to the former two, not the latter two.

16 Q Now, the other items, 3 through 8, will those be
17 done also at the first refueling outage following restart?

18 A (WITNESS CAPODANNO) Yes.

19 CHAIRMAN SMITH: Do some of these -- do any of
20 these modifications require operating -- plant operation for
21 their design or some type of assessment? You don't know
22 when that plant is going to restart. How did you happen to
23 pick -- how is it -- these modifications have to be done at
24 shutdown?

25 WITNESS CAPODANNO: Some of them do, most

1 definitely, yes. I am not sure I understand what you are
2 getting at.

3 CHAIRMAN SMITH: I guess I gave you three
4 questions and two observations. How does it happen that 3
5 through 8 are all scheduled for shutdown for fuel reloading?

6 WITNESS CAPODANNO: Some of these, such as Item 3,
7 have been constrained by the availability of equipment from
8 equipment manufacturers. Others, such as Item 4, would
9 require disabling of the emergency feedwater system plus the
10 problems of obtaining equipment from manufacturers, and I
11 believe that is typical of these Items 3 through 8.

12 CHAIRMAN SMITH: Are these items that were
13 required in other B&W plants, too -- I don't mean, too, but
14 were they also -- Were they required in other B&W plants?

15 WITNESS CAPODANNO: Some were. Some, I am not
16 sure. For example, the condensate storage tank alarms I am
17 certain were required of all the owners. I think the
18 addition of cavitating venturis, perhaps not.

19 WITNESS LANESE: I think it would be more correct
20 to characterize the items as ones which will be required of
21 other B&W plants.

22 CHAIRMAN SMITH: None of them require observations
23 during operation before they can be designed, or other
24 calculations made?

25 WITNESS LANESE: We are not dependent upon plant

1 operating data in the future in order to design these
2 systems, no.

3 DR. JORDAN: Three, now, is one of the items that
4 is called for in the lessons learned. That was the item we
5 referred to earlier, wasn't it?

6 WITNESS CAPODANNO: Yes.

7 DR. JORDAN: And it does mean automatic emergency
8 feedwater control?

9 WITNESS CAPODANNO: I am sorry. I think I was
10 incorrect there. I believe the lessons learned addressed
11 auto start and flow indication. Item 3 is addressing flow
12 control.

13 CHAIRMAN SMITH: These items we have been
14 discussing all day are in the June 28, 1979, letter from the
15 licensee, and were incorporated into a notice of hearing,
16 and thus made short-term requirements under that order. I
17 mean, some of them, this is the pattern, and as a matter of
18 fact, the restart report seems to be in the same sequence as
19 set forth in that letter.

20 DR. JORDAN: I guess, as you said, the restart
21 report did not require safety grade emergency feedwater flow
22 control.

23 WITNESS CAPODANNO: I believe the restart report
24 does. The item I was referring to was NUREG-0578. I
25 thought that was your question.

1 DR. JORDAN: Yes. I am sorry. I was referring to
2 0578. I used the wrong term, namely, the lessons learned.
3 And you say under lessons learned Item 3 is not required.

4 WITNESS CAPODANNO: That is correct. Items 217A
5 and 217B in NUREG-0578 address respectively auto initiation
6 and feedwater flow indication.

7 DR. JORDAN: Item 3, is that required in one of
8 the orders then?

9 WITNESS CAPODANNO: Yes, it is.

10 DR. JORDAN: All right.

11 CHAIRMAN SMITH: That is required in the letter of
12 June 28, 1979.

13 WITNESS CAPODANNO: Yes.

14 BY MR. POLLARD: (Resuming)

15 Q Mr. Lanese or Mr. Capodanno, did you have the
16 opportunity to check on the question of the recirculation
17 valve status at the time of restart, the recirculation
18 valves for the emergency feedwater pumps? Will they still
19 fail open on loss of control air?

20 A (WITNESS CAPODANNO) Yes, they will.

21 MS. WEISS: At this time, I would like to move
22 into evidence UCS Exhibit 9, the two-page table entitled
23 Acceptance Criteria for Instrumentation and Control Systems
24 - Table 7-1, from Section 7.1 of the NRC standard review
25 plan.

1 CHAIRMAN SMITH: Any objections?

2 MR. BAXTER: Yes. At the very least, I would like
3 the Board to defer ruling until I have the opportunity to
4 review Section 7.1 of the standard review plan. My concern
5 is whether it is meaningful out of context.

6 CHAIRMAN SMITH: Okay. So we will defer the
7 ruling. Somebody has to have the responsibility, however,
8 of bringing it back to our attention. It will be your
9 responsibility, Mr. Baxter.

10 MS. WEISS: Thank you very much.

11 At this time, we have no further questions of
12 these witnesses.

13 CHAIRMAN SMITH: Okay. I guess we will go to Mr.
14 Adler.

15 Are you prepared, Mr. Adler?

16 MR. ROBERT ADLER: Yes. I think most of our
17 questions were aired already, but we still have a few left.
18 It should not take very long.

19 BY MR. ROBERT ADLER:

20 Q I have a couple of questions concerning the
21 strainers. They relate to the questions that Dr. Little
22 raised on Friday. Can I refer you to Page 10 of Exhibit 15?

23 You indicate that the strainers were removed, and
24 I believe you testified to Dr. Little that the strainers are
25 no longer required. Is that correct?

1 A (WITNESS CAPODANNO) Yes.

2 Q In the case where you are using emergency river
3 water as a source of feedwater, please refer to Figure 2 of
4 that exhibit. You indicate the presence there of large mesh
5 strainers. My question is whether it is possible that there
6 is debris that would pass through the large mesh strainers
7 that previously would have been caught by the strainers that
8 are being removed and that might adversely affect the
9 operation of the pumps.

10 A (WITNESS CAPODANNO) I do not believe so. There
11 is debris that could come from river water that would be
12 small. I am not certain of the size of those large mesh
13 strainers. They are usually on the order of an eighth to a
14 sixteenth of an inch in size. Something more like sand or
15 silt that might pass through those strainers. As long as it
16 is in suspension, which I think it would be at that point, I
17 do not believe it could have an immediate detrimental effect
18 on emergency feedwater pumps.

19 Q Can you indicate what type of debris might affect
20 the operation of the pumps?

21 A (WITNESS CAPODANNO) When the startup strainers
22 are installed, they are really intended to prevent entry
23 into the pump of most any kind of material that you could
24 expect, and typically you could expect pieces of metal,
25 pieces of wood, pieces of welding dams, which are devices

1 inserted inside the piping system to allow inert gas to be
2 installed while welding a piping systems is done, those
3 kinds of things, some of which are hard metallic objects.

4 Q Relatively large objects?

5 A (WITNESS CAPODANNO) Relatively what?

6 Q Large?

7 A (WITNESS CAPODANNO) Yes, and or in the case of
8 metal pieces hard.

9 Q On Page 10, you list three major component values
10 which can contribute to system unavailability, and the third
11 is potential plugging of EFW Pump Section Strainers. So, I
12 presume when you removed the strainers, that type of debris
13 that would plug the strainers would pass through the pumps.

14 A (WITNESS CAPODANNO) As we mentioned, I think,
15 again, this needs some explanation. B&W in the reference
16 report on Page 9 indicated that plugging of strainers could
17 be a problem, and that is a probabilistic assessment based
18 on some NRC supplied data. In making draft modifications,
19 we identified that as one problem they had identified and
20 removed the strainers.

21 That does not necessarily mean that we agree that
22 there would be debris in the system now that could either
23 plug strainers if they were there or do damage to the pumps.

24 Q On Page 4 of your direct testimony, in the last
25 paragraph there, you refer to your analysis of operational

1 errors, and the procedures that have been instituted to take
2 care of those potential errors. Can you specify the errors
3 that you are referring to?

4 A (WITNESS CAPODANNO) I was referring to
5 operational errors such as closing of valves that should be
6 open. That was the primary reference. I believe I also
7 mentioned the other day that having switches in a defeat
8 mode that should not be in a defeat mode is another possible
9 operating error.

10 Q Are you familiar with the procedures that have
11 been instituted to prevent that type of occurrence?

12 A (WITNESS CAPODANNO) I believe I have looked at
13 some in a summary fashion.

14 Q Can you explain the potential consequences, the
15 worst potential consequence of, let's say, closing a valve?

16 A (WITNESS CAPODANNO) If it was a single valve in a
17 system, you would still have emergency feedwater available
18 -- excuse me. In a loop, you would have emergency feedwater
19 available from the other loop. I don't see an automatic
20 worst potential consequence therefore --

21 (Pause.)

22 Q Can you tell me what the analyzed basis is for
23 your determination that two hours is an adequate period for
24 the EFW train being able to perform its functions
25 independent of off-site AC Power?

1 A (WITNESS LANESE) We have performed some of our
2 own analysis of the loss of off-site power, actually,
3 station black ut, in which there is no AC power available
4 either on-site or off-site. In that period of time, you
5 would still have a steam bubble in the pressurizer. You
6 would not have begun to draw steam into the reactor coolant
7 system. And so for at least two hours you have a very
8 stable plant condition.

9 Beyond two hours, as you begin to draw steam into
10 the loop, it is going to become more difficult to predict
11 what happens subsequent to that, although the consequences
12 are not automatically severe.

13 MR. ROBERT ADLER: Mr. Dornsife has some
14 additional questions.

15 BY MR. DORNSIFE:

16 Q If I understood your testimony correctly, you said
17 that prior to restart there will be two safety grade
18 initiation signals for the emergency feedwater system. Is
19 that correct?

20 A (WITNESS CAPODANNO) Yes.

21 Q They were the main feedwater differential pressure
22 and the reactor coolant pump trip, correct?

23 A (WITNESS CAPODANNO) Inoperability of four reactor
24 coolant pumps or loss of main feedwater flow.

25 Q In light of the fact that the main feedwater pump

1 delta p pressure across the pump is sensed in the turbine
2 building, does that affect the safety grade of that signal?

3 A (WITNESS CAPODANNO) No, I do not believe it does,
4 for the reason that the electrical design does several
5 things. It first of all uses qualified components, and
6 although they are in the turbine building, the electrical
7 design also includes therefore some isolation device to
8 protect the electrical system that is not in the turbine
9 building from any failures within the turbine building, and
10 the system is further designed to fail safe so that if for
11 some reason something in the turbine building should affect
12 these components, it would indicate a loss of feedwater.

13 Q So, in other words, if you lost the signal from
14 the transmitter, it would indicate a loss of feedwater?

15 A (WITNESS CAPODANNO) That is correct.

16 Q Wouldn't, however, the same considerations being
17 in a non-seismic building apply to the signals that are
18 going to these main feedwater valves for main steam
19 isolation rupture? I mean, wouldn't they not be safety
20 grade because of their seismic qualifications?

21 A (WITNESS LANESE) The way the plant is laid out,
22 one feedwater loop has valves in the turbine building and
23 the other loop has all the valves in the intermediate
24 building which are seismic, so there is only one loop which
25 has valves in a non-seismic area.

1 Q But those particular valves would be subject to,
2 say, a common mode failure, because of seismic --

3 A (WITNESS LANESE) That would be correct.

4 Q The other automatic initiation signal is the
5 reactor coolant pump -- unavailability of --

6 A (WITNESS LANESE) Maybe I should also add while
7 that is true, that is also an analyzed event, and we have
8 demonstrated acceptable consequences for a single steam
9 generator blowdown with a failure to mitigate feedwater flow
10 to that generator.

11 Q So it would take both main feedwater systems
12 operating and feeding both generators blowing through their
13 common line to cause a beyond design basis accident?

14 A (WITNESS LANESE) No, it would not be both
15 feedwater systems. You would isolate one steam generator.

16 Q Okay. The other automatic initiation signal, the
17 reactor coolant pump trips, is it not true that that system
18 is safety grade in that maybe the initiation or the
19 transmitters or the signals that it is receiving are safety
20 grade, but in fact prior to restart on many events the pumps
21 will require a manual trip, so from that standpoint they are
22 not safety grade?

23 Let me go back and try to rephrase it. Is it not
24 true that in some events, as was previously stated in the
25 testimony on other contentions, that for some loss of

1 coolant accidents, the operator prior to restart would
2 manually require tripping the reactor coolant pumps?

3 A (WITNESS LANESE) He would manually trip the
4 reactor coolant pumps when he reaches 1600 pounds initiation
5 and there are other loss of coolant events in which he does
6 that when he losses the subcooling margin.

7 Q So therefore prior to restart it would not
8 necessarily -- the signal that would require starting the
9 emergency feed pump, the emergency feedwater system would
10 not necessarily be a signal but an operator action of
11 tripping those pumps?

12 A (WITNESS LANESE) Yes. I think we have already
13 indicated that there are some situations in which we are
14 depending on the operator to initiate emergency feedwater
15 within 20 minutes. That is correct.

16 Q Based on that statement that you just made about
17 operators initiating emergency feedwater in 20 minutes, is
18 there any isolation valve on the TMI 1 emergency feedwater
19 system that are similar to the valves that were on the TMI 2
20 system that were isolated by the operator preventing the
21 block valves were isolated -- preventing emergency feedwater
22 flow? Is there similar layout here, that that could be a
23 common failure?

24 A (WITNESS CAPODANNO) There is a discharge gate
25 valve at the pumps. Is that what you are referring to?

1 Q No, motor operated valve, that during testing both
2 valves could be closed, as was postulated, that cause the
3 unavailability of emergency feedwater during the TMI 2
4 accident. Is there a similar type of arrangement here that
5 would be vulnerable to that type of a failure?

6 A (WITNESS CAPODANNO) I am not sure I understand
7 you, but there is -- I said there is a manual valve that can
8 obviously be closed or open.

9 Q I am not speaking manual valves. The TMI 2 system
10 in order to test the emergency feedwater system, there were
11 block valves that were closed in order to recirc back to the
12 condensate storage tanks, and my understanding is, they were
13 in addition to the regulating valves. They were not the
14 regulating valves.

15 Now, apparently, from my review of this system,
16 those valves are not on the system. Is that correct?

17 A (WITNESS CAPODANNO) That is correct. There is no
18 power operated block valve.

19 Q But you could still close the regulating valve and
20 perform the same type of function. In fact, that is
21 probably the way you test the system, right?

22 A (WITNESS CAPODANNO) I believe the gate valve is
23 the one that is closed, and then the pump is tested by
24 pumping through the recirc path.

25 Q Based on what you said about operators initiating

1 emergency feedwater for certain transients, would it not be
2 possible that the steam generators could blow dry by the
3 time the operator would have initiated emergency feedwater?

4 A (WITNESS LANESE) Yes, it would be possible.

5 Q Would it also not be possible with the steam
6 generators blown dry that the main steam isolation -- main
7 steam rupture detection system would sense there would be a
8 break in the steam generator?

9 A (WITNESS LANESE) Yes, that is possible.

10 Q Would that be possible to occur in both steam
11 generators, if both were to blow dry?

12 A (WITNESS LANESE) If emergency feedwater and main
13 feedwater were interrupted, both steam generators in a way
14 in which no initiating signal was generated, then it would
15 be possible for both generators to blow down below 600
16 pounds.

17 Q Would that then cause initiation of the main steam
18 rupture system -- detection system for both trains?

19 A (WITNESS LANESE) Yes, it would.

20 Q How then would the operators when they decided --
21 when they finally got the emergency feedwater system, start
22 emergency feedwater flowing to that particular steam
23 generator that they would choose?

24 A (WITNESS LANESE) He would have to bypass the
25 rupture detection signal.

1 Q And is that something that is fairly easy to do?
2 I mean, how would the operators know that indeed that was
3 the case? Is there any -- Is there easy indication to
4 indicate that that is indeed the case, and how difficult is
5 it to bypass that signal and open the regulating valves?

6 A (WITNESS LANESE) I do not recall the location of
7 those indicators on the TMI 1 control room panels.

8 Q But it would probably be something similar to
9 bypassing, probably to the high pressure injection.

10 A (WITNESS LANESE) That is my understanding --

11 Q Something of that nature.

12 A (WITNESS LANESE) That is my understanding of the
13 design, yes.

14 Q Do you think there would be adequate indication
15 that indeed the operator should bypass that system?

16 A (WITNESS LANESE) I do not see any basic conflicts
17 in his recognizing that he can bypass the system.

18 Q Would you repeat that?

19 A (WITNESS LANESE) I do not see any conflicts that
20 would prevent him from bypassing the system under those
21 circumstances. He recognizes he has lost or is losing
22 subcooling margin, and then he needs to restore the heat
23 sync.

24 Q The last question I have then is, is this
25 particular instance covered by procedures?

1 A (WITNESS LANESE) There is a procedure for loss of
2 flow to one or two steam generators.

3 Q Does it indeed tell him to look for blowdown of
4 steam generators and in fact the rupture detection system
5 actuating causing this particular problem, that he would
6 need to bypass this safety system?

7 A (WITNESS LANESE) I have not read the procedure in
8 a long time, so I cannot address that question.

9 Q Do you think it should be covered by procedure?

10 A (WITNESS LANESE) Yes, it certainly should.

11 MR. DORNSIFE: Thank you. I have no further
12 questions.

13 CHAIRMAN SMITH: Mr. Cutchin?

14 MR. CUTCHIN: Thank you, Mr. Chairman. I have a
15 very few questions. I will be referring to Licensee's
16 Exhibit 15, and starting at Page 6 of the text.

17 BY MR. CUTCHIN:

18 Q Gentlemen, either of you may answer these
19 questions.

20 On Page 6, in Item Number 2, in the second
21 sentence, you use the term "safety grade redundant
22 indication." On Page 7, in the last sentence on the page,
23 you use the term "safety grade" when referring to hardware.
24 And on Page 10, you use the term in the second line of
25 Section F, "single failure proof safety grade design," and I

1 guess this causes me some confusion, and I am not sure what
2 it does for the record.

3 Does not the term "safety grade" when applied to a
4 system design include considerations of redundancy, single
5 failure proof, environmentally qualified, seismically
6 qualified?

7 The problem I am having is, when you use the term
8 "safety grade" as you apply it to these different things,
9 and you use modifying words like "single failure proof,"
10 "safety grade redundant indication," so, could you help me,
11 and let me ask the questions one by one?

12 As you use the term "safety grade redundant
13 indication" on Page 6, why do you need the term "redundant,"
14 and what does the term "safety grade" mean to you when
15 applied to indication?

16 A (WITNESS CAPODANNO) I think you are correct in
17 that the word "redundant" is in itself redundant. Again,
18 what we meant was -- and as you mentioned, environmental
19 qualification, separation, components that are redundant.
20 There is an A and B loop component. That is what we meant.
21 And perhaps we got a little wordy there by saying "safety
22 grade redundant."

23 Q Can I assume that the words on Page 10 as applied
24 to design, the term "single failure proof safety grade
25 design," is the term there redundant also?

1 A (WITNESS CAPODANNO) Yes, sir.

2 Q One more question. On Page 9, you use the term
3 "Class 1E powered." Can you, if it is possible, relate the
4 two terms "Class 1E" and "safety grade?" Is there any
5 correspondence at all between those two terms, or do they
6 mean something entirely different?

7 A (WITNESS CAPODANNO) No, they are basically the
8 same in that again we are talking about redundancy. In this
9 case, power supply. In the other case, redundancy of
10 mechanical components. We are addressing physical
11 separation of power supplies. We are addressing certain
12 levels of quality as identified in electrical hardware
13 standards, some of which in fact use the term 1E.

14 The "safety grade" - "1E" correlation is one for
15 one, keeping in mind you may be talking about mechanical
16 versus electrical in some instances.

17 MR. CUTCHIN: Thank you. No further questions.

18 (Whereupon, the Board conferred.)

19 EXAMINATION BY THE BOARD

20 BY DR. JORDAN:

21 Q There has been a large number of questions, and
22 probably in view of the hour I am going to ask just a few,
23 one or two questions tonight, and then reserve -- you will
24 have time for thinking about it overnight, the possibility
25 of a few questions tomorrow.

1 Can you recap for me a little bit? Prior to
2 restart there will be some occasions when operator action or
3 operator control -- I mean -- I did not say it properly.

4 As a short-term action for restart, are there
5 still some instances where an operator control will be
6 required, and does that in itself mean that safety grade has
7 not been achieved?

8 A (WITNESS CAPODANNO) As we have mentioned, the
9 regulating valves under certain circumstances could be
10 operated by the operator from the control room. I also
11 mentioned the other day that under some other circumstances
12 it might be necessary for the operator to line up the river
13 water source for cooling water for emergency feedwater.

14 I do not believe in either instance that that
15 means it is automatically not safety grade. I take safety
16 grade to apply to components, pieces of hardware.

17 Q I see. If an operator is controlling a safety --
18 engineered safety system, doesn't the -- isn't there a
19 single failure built in in that the operator himself can be
20 the failure, and is that indeed not a likely single failure
21 event?

22 A (WITNESS LANESE) I do not believe that it is a
23 likely single failure event, given the additional training,
24 the additional analyses, the additional control room panel
25 layouts that have been implemented since the TMI 2 accident.

1 I think he has a very basic goal in that he knows
2 -- one operator is responsible for this, that he is
3 responsible for establishing a secondary system heat sync,
4 and he has the indication available that tells him whether
5 he has it or not, especially with respect to emergency
6 feedwater flow level indication, pressure, and primary
7 system saturation margin.

8 I think the first part of that question was,
9 aren't we susceptible to operator errors.

10 Q You surely must be.

11 A (WITNESS LANESE) Certainly we are, yes.

12 Q I am just wondering how reliable you are placing
13 -- what degree of reliability you are placing on the
14 operator himself, and it seems to me to say that an operator
15 is more reliable, for example, than a control grade piece of
16 equipment is maybe subject to some doubt. And certainly a
17 control grade piece of equipment which was controlling and
18 important engineered safety feature would not be an
19 acceptable practice.

20 But you say an operator is an acceptable practice,
21 and it means therefore you are assuming he is much more
22 reliable.

23 A (WITNESS LANESE) If we talk not in terms of
24 single failure but talk in terms of the availability of this
25 system, the operator is only going to have to take manual

1 control if first the ICS has failed to perform its function.

2 Q But this is something that we know we have to plan
3 on, because it has happened so many times before. This is
4 an event that must be planned for.

5 A (WITNESS LANESE) You have to consider it will
6 happen again, certainly.

7 Q Yes.

8 A (WITNESS LANESE) Nevertheless, I do not think
9 that the operator's goal is all that complex. The operator
10 is responsible for the secondary system, is responsible for
11 maintaining a secondary side heat sync.

12 Q Secondary side what?

13 A (WITNESS LANESE) Heat sync.

14 Q Yes.

15 A (WITNESS LANESE) And it really is that
16 straightforward. He should not have to dry steam
17 generators, dry depressurized steam generators. He should
18 be maintaining level at the proper set point, and even in
19 the TMI 2 accident what did him in, I think, was that he had
20 an indication that emergency feedwater flow had been
21 initiated. He had pressure instead of flow. And even in
22 that situation within eight minutes he recognized that was
23 not correct. Then he reinitiated emergency feedwater flow.

24 There are distinctions between some of these
25 actions which are hard to figure out or not very obvious and

1 some which he is used to performing on a daily basis.

2 Providing a heat sync through the steam generator is one of
3 the most basic functions that the operator has. And I think
4 he is highly reliable in those situations.

5 Q Other than the operator, have you carefully looked
6 at the system to see how many single failures from outside
7 the system could result in a common mode failure of the
8 system itself. How extensive has been your analysis of
9 common mode failures defeating the emergency feedwater
10 system?

11 A (WITNESS LANESE) Did you say aside from the ICS?

12 Q Yes.

13 A (WITNESS LANESE) Aside from the operator?

14 Q Aside from the operator and ICS, are there not a
15 number of other common mode failures that might lead to
16 defeat of the entire emergency feedwater system? I think
17 you have mentioned, in fact, in your testimony that there
18 were other common mode failures.

19 A (WITNESS LANESE) I think we referred to the high
20 energy line breaks in the intermediate building. Beyond
21 those, I would characterize it as a relatively simple system
22 that has diverse sources of control power and of mode of
23 power. And I cannot think of any other common mode failures.

24 Q Is this system almost unique ther in that its
25 reliability -- aren't most protection systems subject to

1 common mode failures? Haven't, in fact, indeed, have not
2 most protection system failures been common mode?

3 A (WITNESS LANESE) I think the difference with this
4 system is, you have a turbine driven pump and two motor
5 driven pumps and that turbine driven pump is working on
6 independent principles, independent design from the motor
7 driven, so you are not dependent on the same
8 instrumentation, say, to control that pump as controls the
9 others, again, other than the ICS commonality.

10 Q Can you not conceive of a system or an instance
11 where an operator is recalibrating the level instruments and
12 calibrates every one of them wrong? Has this not happened
13 in the past?

14 A (WITNESS LANESE) Certainly. That would have the
15 potential for eliminating one of the initiating signals.

16 Q How is that?

17 A (WITNESS LANESE) It would have the potential for
18 eliminating one of the initiating signals.

19 Q Not all? If he uses a meter on the wrong scale,
20 calibrates them all with the same meter?

21 A (WITNESS LANESE) For example, the loss of main
22 feedwater signal is dependent on a differential pressure
23 signal. The loss of water reactor coolant pumps is not.

24 Q Yes.

25 A (WITNESS LANESE) So there would not be that sort

1 of common mode failure introduced. He could not calibrate
2 both systems using the same meter and have both of them
3 fail. They work on different principles.

4 Q If the operator works on the meters or the
5 switches or whatever, can't he mess them both up at the same
6 time? Isn't that -- in fact, if he messes up one, isn't he
7 most likely to mess up the other one at the same time? If
8 he does one of them wrong, he is likely to do both of them
9 wrong?

10 A (WITNESS LANESE) There is the maintenance type
11 error that would result in the loss of one of the initiating
12 signals.

13 Q Both of the initiating signals?

14 A (WITNESS LANESE) I would not think that would be
15 very likely in this situation, again, because they are
16 diverse forms of initiation. One is measuring differential
17 pressure. Another is measuring the power to the pumps and
18 indicating that the pumps are either running or not running.

19 Q Yes. But upon loss of the main feedwater, you do
20 not wait until the pumps stop before you initiate emergency
21 feedwater. It is just enough to have lost either one, isn't
22 it?

23 A (WITNESS LANESE) No.

24 A (WITNESS CAPODANNO) Either main feedwater pump?

25 Q If you lose your main feedwater --

1 A (WITNESS CAPODANNO) If you lose both main
2 feedwater pumps -- if there was only one --

3 Q No, that is right, but if you lose both of them,
4 surely they must have similar type gauges or signals on each
5 feedwater pump, main feedwater pump. The loss of both of
6 them does start, of course, the emergency feedwater. Is
7 that right?

8 A (WITNESS CAPODANNO) Yes.

9 Q Now, can you not conceive of a system where both
10 of them are lost but you fail to get the signal to start
11 emergency feedwater because, as I say, the operator has
12 messed up one? He can mess up both.

13 A (WITNESS CAPODANNO) I think there are a couple of
14 things that are going to have to happen.

15 Q I don't see why -- I don't see any diversity in
16 that case.

17 A (WITNESS CAPODANNO) What I am getting to is that
18 if you are checking an initiating instrument like a pressure
19 switch, normally test instruments are calibrated, so you
20 would have to assume, first of all, that the calibration of
21 that instrument was in error. The second thing, which I do
22 not know is or is not true, but you would also have to
23 assume that the testing sequence for instruments told the
24 operator to go test all the initiating instruments for loss
25 of main feedwater at the same time, and presumably with the

1 same device.

2 If the situation were such that he was not
3 procedurally doing it that way, then you would not
4 recalibrate all four pressure switches at the same time, and
5 I really do not know right now which way it works.

6 Q Well, I guess all I am perhaps doing is arguing a
7 philosophy of my own, and I believe that a common mode
8 failure is the most likely failure, but the question we of
9 course are here to deal with is what is the reliability,
10 whether it is common mode failure, failure of components,
11 and I believe you said that that was in your opinion more
12 likely a simultaneous failure of components than common mode
13 failure.

14 A. (WITNESS CAPODANNO) I think what I said was that
15 I thought at this point with the changes to the system, you
16 would expect some component error to occur more frequently
17 than some operator error that would defeat the system.

18 Q I will return to some of this tomorrow, but I have
19 one or two clarifying questions. Do you know whether the
20 loss of saturation meter proposed for the TMI 1 will trigger
21 any of the emergency safety features? Will it be used in
22 itself as a trigger?

23 A (WITNESS LANESE) Not before restart. At present
24 our plans would be that saturation either by itself or in
25 combination with 1600 pounds in the reactor coolant system

1 in the long term would trip the reactor coolant pumps.

2 Q But there are many cases -- occasions, I believe
3 it was said, when the operator observes whether he has
4 adequate saturation before taking some action. And if that
5 is the case, wouldn't it be better to have the action either
6 be automatically taken or automatically prohibited if that
7 is the proper direction, by the lack of saturation rather
8 than having an operator observe and then taking the action?
9 Is it because you do not have adequate trust in the
10 saturation meter? That is what I am getting at.

11 A (WITNESS LANESE) I think in general we at least
12 within the control and safety analysis group of GPU believe
13 it is a good signal, and we are continuing to evaluate the
14 application of that signal as an initiation signal. It is
15 not likely that anything would be complete before restart.

16 Q I see. You are considering the possibility of
17 connecting it into the control and safety system?

18 A (WITNESS LANESE) I am certain it would not be
19 installed before restart. I doubt we would finish our
20 review before restart. We are predisposed to use a signal
21 like that, yes.

22 (Whereupon, the Board conferred.)

23 BY MR. JORDAN: (Resuming)

24 Q One of the documents I read recently said that
25 they had observed that the PORV operates about 50 percent of

1 the time in a gagged condition in the B&W plants. Is that
2 the case at TMI 1, or will that be the case?

3 A (WITNESS LANESE) No, it has not been in the
4 past. I would not expect it to be in the future.

5 Q Under what circumstances is it operated in a
6 gagged condition, and why? Do you know why it is that this
7 particular member of ACRS staff determined that it was in a
8 gagged condition in 50 percent of the cases? What is the
9 reason why it should be gagged?

10 A (WITNESS LANESE) It is a test of my memory, but I
11 believe the problems were with valve leakage at other
12 plants. And we have in fact changed the valve out for that
13 reason.

14 Q What?

15 A (WITNESS LANESE) We have changed the valves
16 sometimes out to prevent leakage, to prevent problems with
17 leakage during operation. We were aware that it would
18 become a problem and the valve was changed. That is my
19 recollection, at least.

20 Q But it was not changed in TMI 2 before the
21 accident?

22 A (WITNESS LANESE) That I cannot remember.

23 DR. JORDAN: The Chairman has observed the time is
24 running on, and I would like to review over the evening, and
25 I will have a few questions tomorrow morning.

1 CHAIRMAN SMITH: All right. Nine a. m., everybody.

2 (Whereupon, at 6:04 p. m., the hearing was

3 recessed, to recovene at 9:00 a. m. of the following day.)
