EXECUTIVE SUMMARY

Aquatic

Fall-winter 1980 sampling was performed in November 1980 and January 1981. November 1980 results for phytoplankton, periphyton, benthos, fish, and water quality were presented in the Fall 1980 Quarterly Report (Texas Instruments, 1981). This winter quarterly contains the results for zooplankton, ichthyoplankton, and trace-elements in nearshore pond sediments.

Zooplankton collections in Lake Michigan during November 1980 yielded generally similar taxa and densities as were found in November 1979. Samples from Pond C and Cowles Bog showed slightly higher densities and numbers of taxa compared to those of November 1979. Dominant organisms were similar between the two periods except that in Cowles Bog ostracods were replaced by copepods as the dominant organism group.

No ichthyoplankton were collected during November 1980 sampling.

Sediment samples were collected at ash-settling pond stations 13 through 16 and from Pond C (stations 19 and 20). Stations 17 and 18 (Pond B) were dry. The sealing of the ash ponds associated with stations 14 and 15 was complete and samples were taken at these locations. Pond B was dry, possibly a result of ash pond sealing.

Summary of Construction Activities, Bailly Generating Station, November 1980 - January 1981

Construction of Bailly N-1 has been suspended pending completion of review and concurrence by the Nuclear Regulatory Commission of the pile design. The new precipitators and Balance Draft Conversion for Unit 8 has been completed as well as construction on the Coal Dust Elimination System for the Crusher House. The sealing of the ash ponds by stations 14 and 15 has been completed, returning the ponds to operation. The remaining ash ponds will be sealed in spring, 1981.

SECTION 1
AQUATIC ECOLOGY

1.1 STATUS

Samples were collected in November 1980 and January 1981 by a Texas Instruments field crew under the direction of Joe Strube and Joe Saga, respectively. Samples were collected both in Lake Michigan and the interdunal and ash-settling ponds (Figure 1.1).

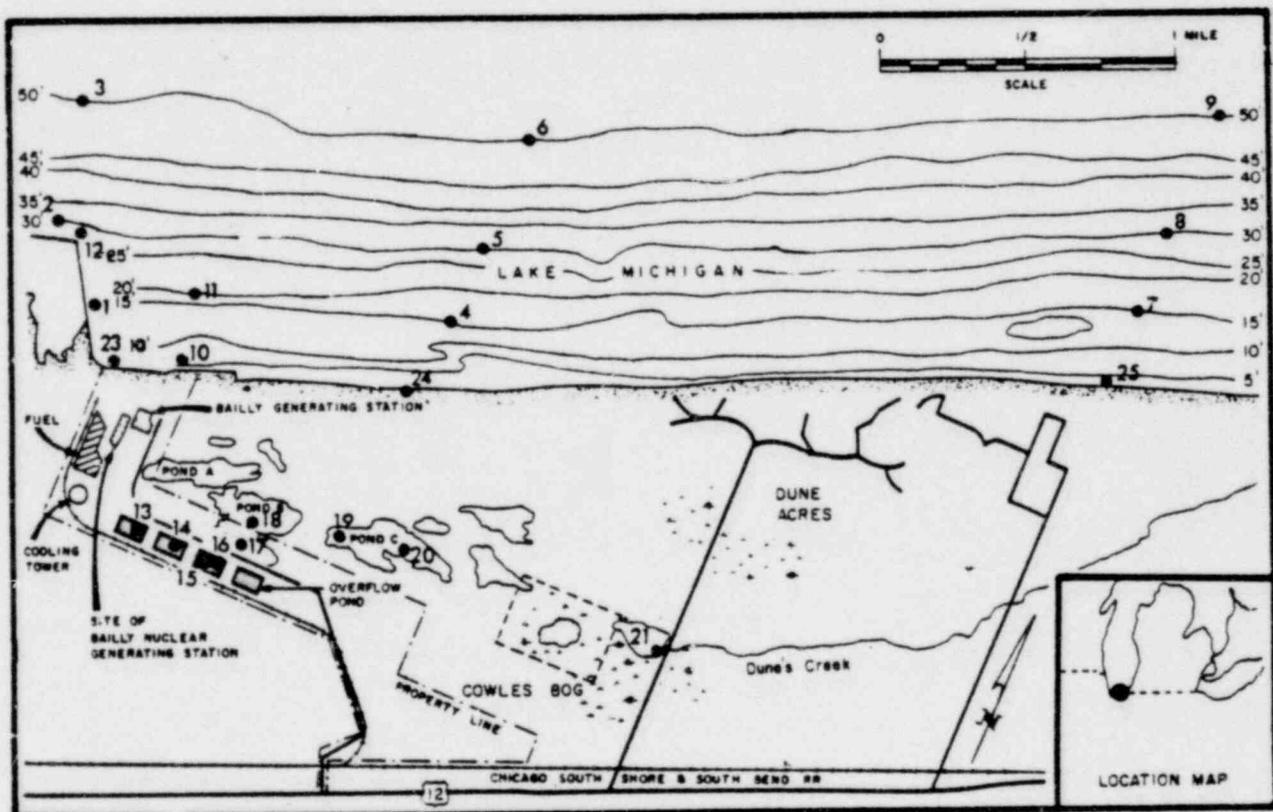

Figure 1.1. Aquatic Sampling Stations in Baily Study Area

Dredging activities in Lake Michigan noted during previous months had been concluded prior to sampling. No samples were taken at pond stations 17 and 18 as Pond B was dry. Sediment samples collected from stations 15 and 16 in the ash-settling ponds contained only large rocks and could not be appropriately analyzed. The dates and purposes of field trips and the status of collected samples are presented in Tables 1.1 and 1.2.

*Since the objective of the food-habits study is to collect 50 specimens each of six taxa over the course of a year, analyses cannot be performed until all fish are collected. Results will be in the annual report.

**Sediment samples also collected in January 1981.

1.2

ZOOPLANKTON

Summary data for November 1980 zooplankton are presented in Tables 1.3, 1.4, and 1.5 while replicate data by station are contained in Appendix A.

17*				
18*				
Pond B (17, 18)*				
19	27	2,210	3.11	0.71
20	23	5,302	2.80	0.68
Pond C (19, 20)	29	3,756	2.96	0.70
Cowles Bog (21)	24	120	2.26	0.65
All Pond Samples	35	1,938	2.61	0.67

*Pond was dry.

November 1980 samples yielded 23 taxa of zooplankton in Lake Michigan with an average density of 20,519 per cubic meter. These numbers represent slight increases from November 1979 (21 taxa and 19,562 organisms per cubic meter). Cyclopoid copepods were the dominant organisms present in 1980 as was the case in November 1979 samples. Cladocerans were the second most numerous group encountered. Nearfield densities (stations 1 through 6 and 10) were slightly lower than farfield densities (stations 7, 8, and 9) with 20,519 and 29,347 organisms per cubic meter, respectively. Cladocerans comprised a greater percentage of the total population at the nearfield stations.

Densities within Pond C and Cowles Bog were slightly higher than noted in November 1979. Pond C averaged 3756 organisms per liter with 29 taxa represented, while Cowles Bog had 120 organisms per liter and 24 taxa (Table 1.5). Cladocerans dominated the zooplankton in Pond C with copepods dominant in Cowles Bog. Dominance in Pond C was similar to that noted in 1979; however, ostracods had been dominant in Cowles Bog during the previous November. The ostracod dominance was unusual and its nonrecurrence alludes to its rare occurrence.

1.3 ICHTHYOPLANKTON

Ichthyoplankton collections with the zooplankton net at stations 1 through 10 and the epibenthic pump at stations 4 and 7 yielded no fish eggs or larvae as usually has been the case during prior years of November sampling (Texas Instruments, 1980).

1.4 TRACE-ELEMENTS IN SEDIMENTS

Sediment trace-element concentrations were measured from samples collected in January from the ash-settling ponds and Pond C. Ash-settling pond station 15 and 16 samples contained only rock substrate, inappropriate for analysis. Because Pond B was dry, no samples were collected there. Results for the January 1981 samples are provided in Table 1.6.

Lead, mercury, selenium, and vanadium were undetectable in sediment samples from the ash-settling ponds as was the case in January 1980 samples (Texas Instruments,

1980). Detectable concentrations (although relatively low) were noted for cadmium, chromium, copper, and nickel in January, 1981; these had been below detection in January 1980.

Table 1.6

Trace-Element Concentrations (mg/kg Dry Weight) in Sediment Samples from Nearshore Pond Stations, Bailly Study Area, January 1981

* Variable minimum detection limits based on concentration necessary for analysis.

** Rock substrate; samples inappropriate for analysis.

*** Pond dry.

† Unusually high levels.

In natural Pond C, lead, mercury, and selenium generally were below levels of detection (a single selenium value was above the detection limit). However, increases in the concentrations of cadmium, chromium, copper, iron (unusually high level), manganese, nickel, vanadium, and zinc were observed when compared to the previous January samples. The increase in iron is notable; its source presently cannot be identified. Other value changes are within the range observed during past years of study. None of the trace-element concentrations observed appear to be exerting additional stress on the aquatic ecosystem in Pond C.

January 1981 sediment concentrations of percent solids were higher in the ash-settling ponds and lower in Pond C than during January 1980. Phosphorus levels were generally similar in the ash-settling ponds during January of the 2 years while concentrations in Pond C in January 1981 were elevated over those of the same month in 1980. The types of variations observed are typical of past years' comparisons.
