USDOE/Japan PNC Technology Exchange

Zan Hollander, DP-323.1

Under the subject exchange, Department of Energy (DOE) has supplied on loan to the Power Reactor and Nuclear Fuel Development Corporation (PNC) of Japan three 4-stage banks of centrifugal contactors for testing in a research and development (R&D) facility in Japan. The units are, as stated in the Agreement, considered to be scientific, not having a commercial character. The units were designed as one of a series of experimental units, the test data from which will ultimately be used, along with other data, to design prototype centrifugal contactors for a demonstration in the mid-1990s in the Recycle Equipment Test Facility (RETF), now under design in Japan and at Oak Ridge. The tests in the research and development facility of the experimental units will include hydraulic tests, mass transfer evaluations, limited remote maintenance evaluations, and performance during continuous operation. The units will be used for cold tests only with natural or depleted uranium. Other design data for the contactors for use in the RETF will come from rack-mounted contactors to be cold tested at the Oak Ridge National Laboratory; these units have not yet been fabricated.

The objective of the demonstration in the mid-1990s in the RETF will be the testing of specially designed, rack mounted contactors under prototypical hot test conditions. Such conditions are not available in the United States. The RETF is being designed and will be constructed especially for an integrated equipment test. In scale and function, the RETF could be considered pre-pilot plant.

The experimental centrifugal contactor units that have been shipped were not designed for and will not and cannot be used for the reprocessing of spent nuclear fuel. These units are several stages of development from the prototype units that are planned to be used in the RETF. The Agreement provides for the return of the contactors after the test program in the RED facility is completed in the early 1990s.
