## INTRODUCTION

This Semiannual Radioactive Effluent Release Report, submitted in accordance with Technical Specification 6.9.1.7, covers the periods from July 1, 1989, through September 30, 1989, and October 1, 1989, through December 31, 1989. Meteorological data summaries for the whole of 1989 are included as is an assessment of offsite doses due to liquid and gaseous effluents for the whole year. By contractual agreement with New York State the Long Island Lighting Company (LILCO) will transfer the Shoreham Nuclear Power Station to the Long Island Power Authority. LILCO cannot operate the plant in the interim. In order to protect plant systems and ready the plant for decommissioning, the fuel was transferred to the spent fuel pool in August, 1989 and plant layup activities began. Prior to defueling, the plant was in a cold shutdown condition for almost two years.

### A. SUPPLEMENTAL INFORMATION

#### 1. Regulatory Limits

Shoreham's effluent regulatory limits are defined in Facility Operating License NPF-82, Shoreham Nuclear Power Station, Appendix A, Technical Specifications.

- a) Limits for gaseous effluents and noble gases are covered by Technical Specifications 3.11.2.1 and 3.11.2.2.
- b&c) Iodines and particulates with half-lives greater than 8 days in gaseous effluents are addressed in Technical Specification 3.11.2.3.
- d) Liquid effluent limits are described in Technical Specifications 3.11.1.1 and 3.11.1.2
- e) In addition, with Shoreham's sampling and analysis program the following typical minimum detectable activities (MDA's) were achieved. These MDA's are less than the required lower limits of detection (LLD's)

#### Liquid:

Ce-141	3.3 E-8	uCi/ml
Co-58	3.3 E-8	uCi/ml
Cs-137	3.2 E-8	uCi/ml
Mn-54	2.9 E-8	uCi/ml
Mo-99	1.8 E-8	uCi/ml
Zn-65	7.3 E-8	uCi/ml

#### Gaseous:

Cs-137	1.1 E-13	uCi/cc
I-131	1.2 E-13	uCi/cc
I-133	7.5 E-13	uCi/cc
Mn-54	2.0 E-13	uCi/cc
Xe-133	2.5 E-13	uCi/cc
Zn-65	3.0 E-13	uCi/cc

## 2. Maximum Permissible Concentrations

a-d) Maximum permissible concentrations (MPC's) are those specified in 10 CFR 20, Appendix B, Table II, Column 2. If an isotope is listed with values for SOLUBLE and INSOLUBLE states, the more conservative value is utilized. For gaseous effluents, MPC's were not used. Direct calculations of dose were utilized to satisfy the dose rate limitations of Technical Specification 3.11.2.1.

## 3. Average Energy

No isotopes above minimum detectable activities were measured in gaseous effluents. Therefore, there is no reportable average energy for this time period.

## 4. Measurements and Approximations of Total Radioactivity

a-d) Samples were collected in the manner and with the frequency prescribed in Technical Specifications Surveillance Requirements 4.11.1.1.1 and 4.11.2.1.2. Samples were analyzed in accordance with Technical Specification Tables 4.11.1.1.1-1 and 4.11.2.1.2-1 regarding both type of analysis and level of sensitivity. Most samples were analyzed by gamma spectroscopy with a Germanium detector. A liquid scintillation counter was used to analyze for H-3 and Fe-55 while Sr-89,90 analyses were done by proportional counter. Samples analyzed for iron and strontium underwent a chemical separation prior to counting. Approved sample collection and analysis procedures were followed.

Analytical results are examined to ensure that the minimum sensitivity levels required by Technical Specifications lower limits of detection (LLD's) have been met. Any identifiable peaks above background are quantified.

The methods above were used for batch releases. The same methods were used for continuous discharges, but were combined with gross activity measurements on process streams and total flow for these streams.

No estimate of percent total error is provided in Table 1A because all values for gaseous effluents were determined to be less than required LLD's. For liquid measurements, the overall error is estimated from the tank sampling error and from counting error at values close to minimum detectable activities. This overall error is estimated to be approximately 50%.

5. Batch Releases

a) Liquid	3rd quarter	4th Quarter
1. Number of batches	5.20 E+1	7.00 E+1
2. Total Time (minutes)	8.06 E+3	1.15 E+4
3. Maximum Time (minutes)	1.82 E+2	2.25 E+2
4. Average Time (minutes)	1.55 E+2	1.64 E+2
5. Minimum Time (minutes)	2.00 E+1	3.40 E+1
6. Average Flow (gpm) (Dilution)	7.04 E+4	1.48 E+5

b) Gaseous - None

6. Abnormal Releases

a) Liquid - None

b) Gaseous - None

SEMIANNUAL RADIOACTIVE EFFLUENT  
RELEASE REPORT

B - GASEOUS EFFLUENTS

3rd and 4th Quarters of 1989

All samples of gaseous effluents were analyzed and determined to be at or below minimum detectable activities (MDA's) for all radionuclides listed in Shoreham's Technical Specifications. These MDA's were below the lower limits of detection required in Technical Specification Table 4.11.2.1.2-1. In addition, no other radionuclides were identified. Therefore, no entries were made in Tables 1A, 1B or 1C that follow.

Composite sample results for the fourth quarter of this reporting period are not available at this time. Third quarter composite results were used for the fourth quarter. When the actual results are available, any significant differences will be noted in supplements to this report. However, as stated previously, all results are at or below MDA's. No significant differences have been noted between previously reported composite results and actual results. All results have been at or below MDA's.

SEMIANNUAL RADIOACTIVE EFFLUENT  
RELEASE REPORT

C - LIQUID EFFLUENT

3rd and 4th Quarters of 1989

Tables 2A and 2B contain information on the liquid batch releases for the fourth quarter of 1989. There were no radionuclides above MDA in third and fourth quarter continuous liquid releases or third quarter batch releases, therefore, liquid discharge data for these releases are not included in the Table. Radionuclides that were at or below MDA, which were below the LLD's required in Technical Specification Table 4.11.1.1.1-1, are not included in the Tables.

Composite sample results for the fourth quarter are not available at this time. Third quarter composite results were used for the fourth quarter. When actual results are available, any significant differences will be noted in supplements to this report. No significant differences have been noted between 1989 first and second quarter reported composite results and actual results. All results have been at or below MDA's.

SEMIANNUAL RADIOACTIVE EFFLUENT  
RELEASE REPORT

D - SOLID WASTE

3rd and 4th Quarters of 1989

Table 3 provides information on shipments of solid waste for the third and fourth quarters of 1989. All shipments consisted of dewatered Class A Resins, Filters and Evaporator Bottoms. There were no irradiated fuel shipments. Waste was shipped in 158.1 ft<sup>3</sup> DOT Spec 7A High Integrity Containers (HIC's), approved by the South Carolina Department of Health and Environmental Conservation.

SEMIANNUAL RADIOACTIVE EFFLUENT  
RELEASE REPORT

E - RADIOLOGICAL IMPACT ON MAN

1989

During 1989 two liquid batch releases contained small quantities of Co-60. In April, a batch containing 6.01 uCi's was released and in December a batch containing 11.83 uCi's was released. There were no other radioactive effluent releases from Shoreham during 1989. Monthly dose calculations, performed in accordance with the ODCM, showed that the maximum whole body dose due to the April batch discharge was  $4.4E-8$  mrem for a child, and the maximum organ dose was  $3.4E-7$  mrem to the GI tract of an adult. The doses resulting from the December batch release were similarly low:  $1.30 E-5$  mrem whole body for a child and  $1.04 E-4$  mrem, GI tract, for an adult. Due to the insignificant doses involved, detailed annual doses due to swimming, boating, etc. were not calculated. Radiation doses to individuals and the population due to radioactive effluents from Shoreham were negligible.

Direct radiation (as measured on quarterly TLD's) made no contribution to offsite doses based on a comparison of 1989 dose rates with 1984 (preoperational) dose rates. The highest dose measured was 4.8 mrem/standard month (30.4 days) at indicator location 6A1 compared to the 1984 dose at the same maximum location of 5.1 mrem/standard month. Similarly, the average for all indicator locations was 3.6 mrem/standard month compared to a 1984 value of 3.9 mrem/ standard month.

SEMIANNUAL RADIOACTIVE EFFLUENT  
RELEASE REPORT

F - METEOROLOGICAL DATA

1989

Tables of cumulative joint frequency distribution of wind speed, wind direction, and atmospheric stability are given by quarter for release heights of 33 feet and 150 feet. The joint frequency distributions reflect all data that was determined to be valid by a meteorological consultant.

The percent recovery for joint wind speed, wind direction and delta temperature was 94% for the year.

SEMIANNUAL RADIOACTIVE EFFLUENT  
RELEASE REPORT

G - PCP & ODCM REVISIONS, REMP NON COMPLIANCES AND  
MAJOR CHANGES TO RADIOACTIVE WASTE TREATMENT SYSTEMS

According to Technical Specification 6.9.1.7, the Semiannual Radioactive Effluent Release Report shall include any changes to the Process Control Program (PCP) and to the Offsite Dose Calculation Manual (ODCM) made during the reporting period.

A. & B. There were no changes made to the PCP or ODCM during this reporting period.

Action Statement c of Technical Specification 3.12.1 and a and b of Technical Specification 3.12.2 require certain items of REMP noncompliance to be reported in the Semiannual Radioactive Effluent Release Report.

C. There were no such REMP noncompliances during this reporting period.

Technical Specification 6.15 states that the Semiannual Radioactive Effluent Release Report shall include major changes to radioactive waste treatment systems.

D. There were no major changes to radioactive waste treatment systems during this reporting period.

SEMIANNUAL RADIOACTIVE EFFLUENT  
RELEASE REPORT

H - MISCELLANEOUS SPECIAL REPORTS

3rd and 4th Quarters of 1989

Action Statement b. of Technical Specifications 3.3.7.10 requires that when certain liquid effluent monitoring instrumentation remains inoperable beyond a specified period time, the reason why the inoperability was not corrected within that time should be explained in this report.

On September 15, 1989 the RHR Heat exchanger service water radiation monitors, 1D11PNL-23A and B, were declared inoperable. The RHR Heat Exchangers were out of service at the time and they will remain out of service as part of the effort to protect the plant in its defueled condition. There is, therefore, no potential release path and the monitors will continue to be inoperable.
