

NOV 30 1981

Docket Nos.: STN 50-454
and STN 50-455

APPLICANT: Commonwealth Edison Company

FACILITY: Byron Station

SUBJECT: SUMMARY OF EQB MEETING

A meeting was held November 10, 1981 in Bethesda, Maryland with representatives from Commonwealth Edison Company and its consultants to discuss environmental qualification of equipment for the Byron Station. A list of attendees is given in Enclosure 1.

The applicant made a brief presentation regarding the radiological source term used in the environmental qualification program. In response, the staff indicated that the applicant should use a time-dependent plate-out of radioiodine in the containment as given in NUREG-0588 or justify the use of the assumption of an instantaneous 50% plate-out, of the airborn release. The applicant should also justify: (1) the use of 30 days as the length of time assumed for radiation exposure; (2) the fraction of beta dose considered based on shielding; and (3) the assumption that the center of the containment is the high dose point. Also the applicant should address the relative contribution from each source of radiation in the containment-the sump water, plate-out, airborn, etc.

The applicant brought a number of examples of EQ packages for the staff's review and comments. From this initial review, the staff commented that the format of the central files was good and that the review check list was thorough, covering all necessary areas. The staff also made specific recommendations to improve the EQ packages presented. The applicant stated that the complete EQ submittal would be ready by June 1982.
