		Creek ing St				

No. 1)

Docket No. 50-466

STATEMENT OF MATERIAL FACTS AS TO WHICH THERE IS NO GENUINE ISSUE TO BE HEARD FOR DOHERTY CONTENTION 44

(1) Virtually all of the piping in the feedwater, steam supply, residual heat removal, ECCS, containment spray and service water systems will be made of low carbon stainless steel or plain carbon steel, both of which are not susceptible to integranular stress corrosion cracking. Small segments of open-ended piping in direct contact with the Supression Pool will be made of stainless steel with a slightly higher carbon content. However, this piping will not be subject to the same stress levels as the pressurized piping in which IGSCC has been observed. (Affidavit, pp. 2-3).

(2) The ACNGS will use conservative design practices in accounting for water hammer forces, and will incorporate applicable NRC guidance into fluid system designs as it becomes available. (Affidavit, pp. 3-4).

(3) The ACNGS fluid systems will be designed to eliminate or minimize water hammer. Those systems which have a potential for water hammer will be designed to accommodate the associated loadings. These additional design measures all address areas of concern identified by the NRC Staff in NUREG-0582. (Affidavit, pp. 4-7).

Doherty Contention No. 44/ IGSCC and Water Hammer

COST \$ __ PAID BY PLF. DEF.

UNITED STATES OF AMERICA

NUCLEAR REGULATORY COMMISSION

BEFORE THE ATOMIC SAFETY AND LICENSING BOARD

IN THE MATTER OF: HOUSTON LIGHTING AND POWER COMPANY, (ALLENS Docket No. 50-466 CREEK NUCLEAR GENERATING STATION, UNIT 1)

DEPOSITION JOHN F. DOHERTY

International : 327 Court Reporters, Inc.

'917 Bank of the Southwest Building • Houston, Texas 77002 • (713) 652-5911

General Electric took to reg. guide 1.54? 1 Yes, and that was stated in the earlier A . 2 reference that I gave you. 3 MR. NEWMAN: If it were to be 4 established that none of the compounds identified 5 in your contention 43 are used to clean or coat 6 stainless steel components at Allens Creek, would 7 that then moot your contention? 8 A. Well, the contention lists some elements 9 and some, I've forgotten the term for that, some 10 salts, I guess, but Mr. Newman, if those were 11 removed, yes, that would remove the basis. 12 Q. (BY MR. BIDDLE): Would you turn to your 13 contention 44? 14 A. Incidentally, I'm not an expert on 15 cleaning compounds. 44? 16 Q. Yes. What is water hammer? 17 A. My understanding of it is that it's a 18 force that emerges when steam condenses in piping 19 that normally carries steam and then in some way 20 is moved. In other words, water sitting in a 21 pipe and the pipe is meant to carry steam and it 22 can move as water in the event the system starts 23 operating, that pipe starts in use. 24 If the pipe were sitting idle, for 25 328

INTERNATIONAL COURT REPORTERS, INC.

example, it would then cause this water to move 1 and it strikes a part causing a noise and it's 2 called water hammer. 3 Q. So water hammer is a nuisance as to 4 noise? 5 A. It can hit with enough force that in the 6 contention, what I've said that is in the event 7 the pipes are cracked, the force might be 8 sufficient to break them open. 9 Q. Well, what is the force imparted to the 10 water that's lying in these pipes? 11 A. Well, it might be an additional -- it 12 might be a force of air moving behind it, pushing 13 it forward. That would be one very common one. 14 The moving air is behind the water, so what 15 actually strikes at the weakened place is water 16 which hits with appreciably harder force than 17 steam. 13 Q. So is it your contention that there are 19 pipes at Allens Creek that contain a small amount 20 of water so that they are for practical purposes, 21 empty and that this water can somehow be 22 motivated by the introduction of air with 23 sufficient force to cause problems? 24 A. Yes, broadly, that sounds about right. 25

]

]

]

t -- 1

+ +

1

]

And prove state over the local tests and the state and

329

Q. What causes the air to be in motion? 1 A. There might be any number of reasons in 2 which that system might have some material such 3 as steam or air driven through it or some 4 emergency purpose or some testing purpose or --5 Q. Would you identify the systems in Allens 6 Creek where these motive forces will be 7 introduced into partially filled pipes? 8 A. Well, NUREG 0582, pages 2.2 and 2.3 9 state and I believe this is a summary statement, 10 on the basis of reactor operating experience, the 11 most serious water hammer concerned are pump 12 start-ups with inadvertently avoided lines in the 13 emergency core cooling system and residual heat 14 removal system. 15 Q. So those are the two systems of concern 16 in your contention? 17 A. No, there is an additional one. And 18 main feed water line transients caused by flow 19 control valves. 20 Q. So the three systems of concern in your 21 contention for Allens Creek are --22 A. Those are the three major concern. 23 Q. ECCS, RHR and main feed water? 24 Yes. A . 25

. 18

A are

INTERNATIONAL COURT REPORTERS. INC.

- T		processing and the second
1		
	1	experienced cracking, also.
	2	Q. More specifically, the fact that there
-	3	were cracks at Dwayne Arnold?
T	4	A. Cracks at Dwayne Arnold or are the
-	5	outstanding exampls.
I	6	Q. What similarities exist between the
T	7	materials that cracked at Dwayne Arnold and the
de la	8	materials used in the design of Allens Creek?
I	9	A. Well, I don't know that.
11	10	Q. So you have no real basis for making a
	11	correlation between the cracks at Dwayne Arnold
1	12	and the cracks at Allens Creek?
-1	13	A. At this time, I don't have the specific
ä k	14	information to tell you precisely the material
1	15	that has cracked at Dwayne Arnold, so that if I
11	16	go to the record of Allens Creek, I can't tell
41	17	you, this is exactly the same material.
1	18	Therefore, I cannot tell you.
-1	19	Q. If they were of much different materials
4	20	than the the fact that there were cracks at
1	21	Dwayne Arnold would say nothing about the ability
7	2 2	of the material used for Allens Creek to resist
	23	cracks, would it?
1	24	A. Yes. well, that would depend on what 'much
7	25	difference" would have been.
4		. 334

INTERNATIONAL COURT REPORTERS. INC.

No.	
1	Q. But you don't know what the design is
2	for either of those plants, so you're not in a
3	position to make any judgment as to whether they
4	are similar or different?
5	A. I'm in a reasonable position to judge
5	they are similar, because the pipes have to do
7	similar tasks.
8	Q. Is susceptibility to cracking solely a
9	function of the TASC they have to perform or is
10	it a function of the metal from which they are
11	composed?
12	A. It's not solely a function of the TASC
13	that is performed.
14	Q. Is it a function they are to perform?
13	A. Somewhat.
16	Q. And to what degree?
17	A. If the temperature and pressure that the
18	pipes are subjected to are similar and the flow.
19	the amount of material that must move through
20	them, then they are similar.
21	Q. So you're contending that because Allens
2 2	Creek has pipes which will experience the same
2 3	pressure and temperature environments as those
2.4	that cracked at Dwayne Arnold, Allens Creek's
/2.5	pipes will crack?

THTERRATIONAL COURT REPORTERS, INC.

Allens Creek's pipes have the same Α. 1 difficulties to overcome. In fact, Allens 2 Creek's may even be greater in view of the larger 3 capacity of Allens Creek's than Dwayne Arnold. 4 Allens Creek's pipes will carry more flow, more 5 6 material. Q. So you are contending that the reason 7 you assert that Allens Creek pipes will crack is 8 because they will experience the same or greater 9 or more adverse temperature, pressure and flow 10 7 environments; is that correct? 11 A. As far as I know, they will not 12 experience greater temperature. I think they 13 II will experience a greater amount of water flow, 14 many of them for the component that they are and 15 that would mean that some pipes will carry more 16 Post of than any pipe at Dwayne Arnold. 17 1 Q. So you have put together the fact that 18 there was a crack at Dwayne Arnold and the fact 19 T that flow rates at Allens Creek will be greater 20 Ter. than that experienced at Dwayne Arnold and 21 conclude that the cracks at Dwayne Arnold will 22 Part and also occur at Allens Creek? 23 -----A. There would be similar cracks, it's my 24 belief. 25 -----

1111

338

1	Q. Similar cracks will occur because of the
2	greater flow rates at Allens Creek, is that your
3	contention?
4	A. No, not entirely, because the materials
5	are similar, also.
б	Q. The materials between Dwayne Arnold and
7	Allens Creek are similar?
8	A. Uh-huh.
9	Q. What is the basis for that statement?
10	A. Because the materials have to be have
11	to do the same job that there is an effort made
12	to put the least susceptible to crack materials
13	to work in the nuclear power plants.
14	Q. What was the material used at Dwayne
15	Arnold?
16	A. Specifically, I don't know.
17	Q. What will be the material used at Allens
18	Creek?
19	A. Specifically as I said previously, I
2 0	don't know.
21	Q. Then how can you make any statement as
2.2	to their similarities?
23	A. Because of the reasons I gave you
2 4	earlier.
2 5	Q. You really believe that?

1	A. Yes.
2	MR. NEWMAN: Is there a
3	relationship between the rate of flow and
4	intergranular stress corrosion, cracking?
5	A. I'm not certain there is.
6	MR. NEWMAN: Are you asserting that
7	the intergranular stress corrosion cracking at
8	Dwayne Arnold could occur at the Allens Creek
9	plant?
10	A. It could, yes.
11	MR. NEWMAN: That's the basis of
12	this contention?
13	A. Well, cracking is all I think the
14	contention says. Let me see. It it just says
15	large deep cracks.
16	MR. NEWMAN: What do you mean by
17	that? Your example refers to the intergranular
18	stress corrosion cracking.
19	A. Well, the example was an example not
2.0	meant to include all possibilities.
21	MR. NEWMAN: What, if any other
22	types of cracking do you postulate?
23	A. None other at this time.
24	MR. NEWMAN: Okay.
25	Q. (BY MR. BIDDLE): Have you consulted

1	with any experts on the subject matter of this
2	contention?
3	A. No, sir.
4	Q. Do you hold yourself out as an expert on
5	intergranular stress corrosion cracking or the
6	phenomena of water hammer?
7	A. Not at this time.
8	MR. NEWMAN: Can you identify any
9	instance in which there has been a coincidence of
10	intergranular stress corrosion cracking and water
11	hammer, the result of which has been the cracking,
12	breaking of the pipe.
13	A. Not at this time, no.
14	MR. NEWMAN: Again, that's
15	something you will inform us of as soon as you're
16	able to?
17	A. Yes, I will.
18	MR. NEWMAN: If there were none
19	such, what would the basis of your contention be?
20	A. The ACRS concern.
21	MR. NEWMAN: It would not be based
2 2	on any imperical data?
2 3	A. That's right.
24	Q. Would you turn to contention 30? Let's
25	take about a five minute break first.
