Re: Semiannual Quality Assurance Report  
Ground Water Monitoring - First Half 1990

Dear Mr. McCoy:

In accordance with Section V.A. 15 of the Administrative Order for the Churchrock site, I have enclosed a report regarding performance of ground water monitoring quality assurance procedures during the first half of 1990.

Two sampling episodes occurred in the first half of 1990 - in January and April.

Sincerely yours,

*Edward M. Morales*

Edward M. Morales  
General Manager and  
Radiation Safety Officer

Semiannual Quality Assurance Report  
Church Rock Site  
First Half of 1990  
January and April Events

August 1990

## Table of Contents

- 1.0 Requirements
- 2.0 Field Sampling Procedures
- 3.0 Chain of Custody
- 4.0 Laboratory Quality Control
- 5.0 Data Validation

Appendix A

Field Data Sheets

Appendix B

Chain of Custody Forms

Appendix C

Laboratory Quality Control and Performance Reports

Appendix D

Laboratory Comparison

## 1.0 Requirements

The quality assurance and control procedures are contained in Section 3.0 of the Remedial Action Plan for the Church Rock site dated April 1989. The procedures address sampling, chain of custody, laboratory quality control and data validation.

These requirements became effective on July 3, 1989 when United Nuclear received the Administrative Order on the Church Rock site from the Environmental Protection Agency (EPA).

## 2.0 Field Sampling Procedures

Copies of the field sampling report sheets for the first and second quarters of 1990 are included as Appendix A. These sheets indicate the estimated volume of water purged from the well prior to sampling and the field parameters of pH, temperature and conductivity. The field blank and rinsate analysis reports are also included in Appendix A.

## 3.0 Chain of Custody

Copies of the Chain of Custody forms are included as Appendix B. Energy Laboratories, Inc., our contract laboratory, is located in Casper, WY. Energy Labs inspects the sample shipments upon arrival to verify the information on the Chain of Custody form and to determine if samples arrive at the appropriate temperature.

## 4.0 Laboratory Quality Control

Copies of the Internal Quality Control report prepared by Energy Laboratories and the associated EPA performance evaluations are included in Appendix C. Also included are the results for a spiked GW-1 well sample submitted under fictitious Well #704. This sample was spiked and submitted by UNC.

## 5.0 Data Validation

Analytical reports are reviewed by the Church Rock General Manager/Radiation Safety Officer after receipt from Energy Labs. The reported values are compared to previous reports for each well. Significant increases or decreases and out of range values are identified and the laboratory is requested to recheck the suspect values. The laboratory responds by checking the transcription for these items and, where necessary, repeats the analysis. A revised report is then issued for that sample if an error is discovered.

As a result of this screening process, 25 errors out of 3,410 laboratory determinations were discovered and corrected in the first half of 1990.

A laboratory comparison was performed as part of the second sampling event. A split of GW-1 sample was submitted to Data Chem Laboratories for analysis of cyanide and selenium using the same method used by Energy Laboratories. This was proposed for the first half of 1990 in our last Quality Assurance Report.

The Comparison Data is included in Appendix D.

**Appendix A**

**Field Data Sheets**

| Well No.  | Time  | Date Blown | Water Depth | Field pH | Date Sampled | T.O.P.   | Water Level | 1990                  |                            |
|-----------|-------|------------|-------------|----------|--------------|----------|-------------|-----------------------|----------------------------|

**Appendix C**

**Laboratory Quality Control  
and  
Performance Reports**

**Energy Laboratories, Inc.  
Internal Quality Control Audit  
First Quarter Report for 1990**

**Introduction:**

This report is the first internal quality control audit of 1990. The purpose of this report, therefore, is to assure the continued precision and accuracy of data reported by Energy Laboratories', Casper Wyoming Branch.

This report also functions as the documentation for several areas. First, that the data reported lie within a certain confidence range (usually 95%). Second, that the system is checked periodically to assess the effectiveness of the program. Third, that the staff is in fact following the guidelines of the program. And, lastly, for the updates and modifications that the quality assurance guidelines may have required when it was necessary to adapt to the ever changing conditions of the laboratory.

To satisfy the above stated purpose this report will also discuss such things as continuing performance (certification) study status, equipment and/or personnel changes, and overall laboratory environments. Certain specific data relating to each area can be found in this report. The time frame for this report is the first quarter of 1990.

**Performance (Certification) Status:**

The Radiochemistry Department continued in the first quarter of 1990 with no data outside the acceptance limits of the EMSL at La Vegas. The Trace Organics Department has become independently listed by the USEPA to receive the next rounds of performance and study samples, the first step in becoming independently certified by the agency. The Inorganics Department noted a generally acceptable report on the last two studies (one WP and one WS). The marginal parameters have resulted in several modifications in sample logging, preservation, chain of custody, data transfer and SOP requirements.

**Instrumentation:**

New instrumentation obtained by the laboratory during the first quarter of 1990 included a Perkin-Elmer P-40 Inductively Coupled Argon Plasma (ICAP) spectrometer with an AS-51 autosampler, and a Tekmar 2016 autosampler addition to the gas chromatography equipment. This new instrumentation further increases the laboratory's capabilities in trace inorganic analysis as well as trace organic analysis. The decrease in turnaround time for these types of samples has already proven to be an asset to clients.

The software for the P-40 allows different methods for differing sample matrices as well as it allows for the analysis of up to 88 metallic elements, this makes it more versatile than the 20 to 30 element fixed wavelength ICAP. The software for the PE Nelson system (GC data handling) has been upgraded to level 5.1.2 with many "bugs" fixed. Any remaining "bugs" should be removed when version 5.1.5 arrives in the second quarter. This added instrumentation demonstrates a continuing commitment by the laboratory and the laboratory's suppliers to the analytical community and will enhance the laboratory's analytical capabilities. Projected for future acquisition are auto-analyzers for  $\text{NO}_3^-$ ,  $\text{NO}_2^-$ ,  $\text{NH}_4^+$ .

#### Quality Control Practices:

Overall the quality control practices employed by the laboratory have been quite effective during the first quarter of 1990. Few parameters have been determined to be out of control. The methods accepted for analytical use by the certifying agencies are being followed with no method changes made by any member of the staff. The internal audit showed that the standard operating procedures have been followed effectively and that the general data quality from the laboratory has been acceptable. For the quarter (Jan-Mar 1990), duplication of samples occurred at 11.9 % and spiking occurred at 7.1 % for the entire sample load. Control charts for duplicate and spike samples have been used routinely (attached) and instrument performance tracking has been documented (filed).

#### Personnel and Training:

As demonstration of our commitment to continuing education, David Blaida was sent to the Canberra class in Radiochemical Techniques and Alpha Spectroscopy. This allows the Casper Branch to remain current in new techniques in the ever growing Radioanalysis area. It is also planned to send Steven Dobos to the class required for hazardous waste identification, safety, sampling, and testing.

There were several changes in personnel during the first quarter of 1990. One was the addition of Connie Tucker to our radiochemistry group. She comes from an extensive analytical chemistry background which includes experience at a Radiochemical laboratory in the Casper market. Also Casper experienced the loss of it's past QC Coordinator, Kurt Sletz, to a promotion to the post of Branch Manager of the newly opened Rapid City, South Dakota Division. This change has necessitated the restructuring of QC data collection process with Steven Carlton responsible for the coordination of QC/QA as well as record keeping. The laboratory has also undertaken the groundwork (please pardon the pun) necessary to put both it's TLD program and it's soil lab into full service operation through the addition of Dan Rea to the staff. Shirley Morava has continued to remain an asset to the Casper Branch since Permitting is still in progress at the Crow Butte Mine.

### RE: First Quarter 1990 Analytical Results

ATTN: E.M. Morales  
C.G. Johnson

Gentlemen;

The following information is intended to answer questions raised by Ed Morales and others concerning specific data points generated by Energy Laboratories, Inc. during UNC's first quarter 1990 environmental sampling period. It should be noted that the Casper Branch of ELI maintains records of specific well historical data, and all data generated during first quarter was checked against this record prior to submitting data to UNC. As a result, a number of data rechecks were performed before UNC received any analytical data, this being performed in addition to the stringent quality assurance crosschecks that are necessary to maintain ELI-Casper's EPA certification (information concerning the present status of ELI certification and USEPA reviews was submitted to your organization within first quarter 1990). The attached tables and specific information are provided in order to acquaint UNC personnel with acceptable analytical variation (per USEPA) at or near detection limits for radionuclides and trace metals. It should also be noted that this information is only valid for low solids drinking water (TDS <500 mg/l) and that greater variation should be expected for complex, high solids matrices.

The questioned quarterly data was subjected to the following tests and results of these comparisons are available on the attached table (#1). Where analytical rechecks were warranted by the statistical tests, they were logged for analysis if the sample had not passed the holding time for the analyte required. If significant changes are noted on the rechecks, replacement reports will be forwarded. The statistical tests which were performed include;

### COMPARISON TO 1989 ANALYTICAL VALUES AND VARIATION

Table 1 reviews four quarters of analytical data on each requested analyte and generates a statistical mean and standard deviation. Generally, a 2 sigma error +/- (95% confidence interval) is accepted as good analytical or statistical data quality. Each questioned analyte was subjected to this test, and any which fell outside this range or the range of test 2 (below) was logged for recheck, if possible.

PAGE II

COMPARISON TO USEPA DATA ACCEPTANCE RANGES FOR DRINKING WATER ANALYTICAL DATA  
(USEPA-THIRD QUARTER 1989)

Table #2 identifies the true values and acceptance limits for laboratories participating in the USEPA Clean Drinking Water Act Certification Program. Again, it should be noted that these samples are ideally suited for precise work at or near detection limits, as opposed to mine waters which often contain significant concentrations of species which provide a variety of analytical interferences. This table demonstrates that normal, acceptable, variation under USEPA regulations may exceed +/-80% of the true analyte value at or near the analyte detection limit. This, for instance, should help eliminate questions about analytes that previously were below required detection limits, and at first quarter equalled the LLD. An example of this is found on some questioned cadmium and cobalt analyses which equalled their appropriate LLDs during first quarter. With an LLD of 0.01mg/l (10ppb), a result of <0.01mg/l could, in reality, equal 0.0099mg/l (9.9ppb). With usual EPA acceptance ranges of +/-5 to 10 ppb for trace metals at detection limits, analytical data should be expected to vary from <0.01 to 0.02mg/l on any particular analyte with an LLD of 0.01 (assuming drinking water quality sample was being analyzed).

Other questions on data quality which cannot be addressed by the analytical facility include such things as;

- o Well installation techniques, materials of construction, and development
- o Presampling decontamination and volume of water production from each sampled well or location (preferably 2+ casing displacements and pH and conductance stability)
- o Sample filtration and preservation techniques and methods employed to prevent sample contamination
- o Quality of preservatives used

UNC MINING AND MILLING  
03/30/90  
PAGE III

Energy Laboratories, Inc. appreciates your careful review of our data and we continue to pledge our best efforts in providing as reliable data as can be achieved with advanced analytical equipment. Due to the nature of UNC samples (high TDS and complex matrices), a certain amount of natural variation in the data must be expected. I realize that very minor changes in analytical values can have a profound effect on certain regulators and sympathize with your positions. ELI will continue to review all analytical data presented to your organization, and will attempt to eliminate any errors or identify confirmed trends prior to submitting reports. I hope you find the following data analysis acceptable and usable and hope delays caused by the noted rechecks do not create uncomfortable delays in your schedule.

Very truly yours;

*R.A. Garling*  
Roger A. Garling

Sampling Site 81W1

Industrial Process \_\_\_\_\_

Date of Collection 4/17/90 Time Collected 1339 Date of Shipment 4/10/90

Q.C. REQUIRED \_\_\_\_\_

## **Request for Analyses**

\*Spec#: Solid sorbent tube, e.g. Charcoal, Filter type, Impinger solution; Bulk Sample; Blood; Urine; Tissue; Soil; Water; Other

Comments: Please used Method CN 335.3 EPA  
58 270-3 EPA

#### Possible Interfering Compounds

Requested by Ed March

960 West LeVoy Drive / Salt Lake City, Utah 84123 / 1-800-356-9135 or 801-266-7700 / FAX: 801-268-9992
