REPORT DATE	⑨

EVENT DESCRIPTION AND PROBABLE CONSEQUENCES ⑩

02 During cold shutdown, while reviewing Environmental Radiation fish analysis sample data, it was determined that the lower limit of detection sensitivity (L.L.D.) was not met for several radionuclides during analysis of June 1982 fish samples (Environmental Tech. Spec. table 3.2-1 applies). This has no environmental concerns because this is a matter of specific testing sensitivity and results do fall within applicable Regulatory Guide 4.8 specifications. LER's 81-10, 81-51 and 82-07 reported similar occurrences.

CAUSE DESCRIPTION AND CORRECTIVE ACTIONS ㉗

10 The Station Tech. Specs. specify radiological fish analysis L.L.D. to be 80 pCi/kg dry weight. When laboratory test data is converted from wet weight units to dry weight units, higher L.L.D. values result. A Tech. Spec. proposal is in the process of being submitted to update this parameter to the current Regulatory Guide values; meanwhile, recurrence of this problem is expected until the Tech. Spec. change is approved.
