Introduction

The radiological emergency plan (REP) for the Sequoyah Nuclear Plant (SQN) requires input of the following meteorological data:

- A. A measure of atmospheric stability in the layer between the potential vent heights and about 10 meters.
- B. Wind direction at about 46 meters.
- C. Wind speed at about 46 and 10 meters.

For the REP, the atmospheric stability class is derived from the temperature difference between sensors at 45.99 and 9.25 meters, the wind direction from a sensor at 45.65 meters, and the wind speed from sensors at 45.65 and 9.73 meters on the Sequoyah tower. For convenience, the heights for stability values are given as 46 and 9 meters, and for wind velocity values as 46 and 10 meters.

If one or more of the input data are missing or invalid, "reasonably representative" values may be estimated from selected "reference parameters," with varying degrees of success. These reference parameters include: stability class derived from the temperature difference between simultaneous measurements at 90.79 and 45.99 m, or 90.79 and 9.25 m; and wind velocity measurements at 91.40 m on the Sequoyah tower. (The 90.79 and 91.40 m sensor heights are given as 91 m in the manual). Other reference parameters from the meteorological facility at the Watts Bar Nuclear Plant (WBN) (about 52 km north-northeast of Sequoyah) include: stability class derived from simultaneous temperature differences between 45.63 and 9.51 m, 91.20 and 45.63 m, or 91.20 and 9.51 m; and wind velocity at 9.72, 46.36, or 93.33 m. In the manual, the heights for WBN stability values are given as 10, 46 and 91 m, and for wind velocity values as 10, 46, and 93 meters. Time of day and month are also used as reference parameters.

In general, dose estimators have indicated that they would like limits assigned to estimated values which support a 90 percent confidence factor. An attempt has been made to provide this degree of confidence. Where such confidence was not attainable, the actual confidence factor (in percent) is provided.

The manual is in two parts. The first part provides parameter-specific procedures. The second part provides backup material on which the selection of procedures was based. In general, during a radiological emergency, only the first part will be used.

There is also a fruitless file, which is not included in the manual. This includes procedures investigated which showed little promise and were considered to be unusable.

Table of Contents

<u>Specific Procedures</u>	<u>Section</u>
General Directions	1
Stability Class (46-9 m ΔT)	2
46 m Wind Direction	3
46 m Wind Speed	4
10 m Wind Speed	5
<u>Backup Material</u>	
General Directions	A.1
Stability Class (46-9 m ΔT)	A.2
46 m Wind Direction	A.3
46 m Wind Speed	A.4
10 m Wind Speed	A.5

General Directions

This manual provides procedures for estimating missing values of:

9 to 46 meter stability class
46 meter wind direction
46 meter wind speed
10 meter wind speed

There is a separate section for each of these parameters. The first page of each section is a table of contents for that section. This table lists the reference parameters on which each procedure is based. Also listed, to the right, are the table numbers of the procedures for estimating the missing parameter, based on the reference parameters available. The procedures are arranged in the order of effectiveness, with the most effective listed first.

To estimate a missing parameter, turn to the table of contents of the appropriate section. Read down the list to the first parameter(s) that is (are) available. Turn to the procedure using the available parameter(s) as indicated in the right-hand column. Follow the given procedure to obtain an estimated value of the missing parameter. Note: The procedures are based on hourly reference parameter values given for the end of the hour. For example, the 1200 value is for the hour ending at 1200. Missing 15-minute values should be estimated from the reference parameter values for the hour immediately following. For example, the missing 1114 value should be estimated from the reference parameter value for 1200.

The procedures include the precision limits (as \pm values) that must be assigned in order to reach a 90 percent confidence level, if this level of confidence has been attained. If not, the expected percent of success (the confidence level) is also given. These confidence factors (\pm values and confidence levels) must be provided to the dose estimators with the estimated (nowcast) value.

Missing Parameter - Stability Class 46-9 m ΔT

Read down the table to locate the first reference parameter(s) for which data are available. Read across to locate the appropriate procedure to use.

Reference Parameter	Table No.	Column No.
1. Sequoyah 91-9 m ΔT	2-1	1
2. Watts Bar 46-10 m ΔT	2-1	2
3. Sequoyah 10 m wind speed (WS), Time of day, Month . . .	2-2	
WS \leq 2.2 m/s (5 mi/h)	Block 1	
2.2 m/s < WS \leq 4.5 m/s (10 mi/h)	Block 2	
WS > 4.5 m/s	Block 3	
4. Watts Bar 91-10 m ΔT	2-1	3
5. Sequoyah 91-46 m ΔT	2-1	4
6. Watts Bar 91-46 m ΔT	2-1	5
7. Time of Day	2-3	

Table 2-1 Estimated Sequoyah Stability Class (46-9 m ΔT)^{*}

Reference Parameter	Sequoyah 91-9 m ΔT	Watts Bar 46-10 m ΔT	Watts Bar 91-10 m ΔT	Sequoyah 91-46 m ΔT	Watts Bar 91-46 m ΔT
Reference Parameter Stability Class	A	B \pm 1	A \pm 1	B \pm 1/80%	A \pm 0
A	A \pm 0	B \pm 1	A \pm 1	B \pm 1/80%	A \pm 0
B	A \pm 0	B \pm 1	B \pm 1	B \pm 1	C \pm 1/70%
C	B \pm 1	B \pm 1/85%	B \pm 1	B \pm 1	B \pm 1/65%
D	D \pm 1	D \pm 1/85%	D \pm 1/75%	D \pm 1/75%	D \pm 1/70%
E	E \pm 1	E \pm 1	E \pm 1	E \pm 1	E \pm 1
F	F \pm 1	F \pm 1	F \pm 1	F \pm 1	F \pm 1
G	G \pm 1	F \pm 1	G \pm 1	F \pm 1	F \pm 1

*Following the estimated stability class is the number of stability classes on either side of the estimated class needed to give a confidence level of 90 percent, if that level of confidence was attained. If not, the actual confidence level is indicated. A maximum limit of \pm one stability class was imposed.

WS = Wind Speed

*Use column with heading "All."

Table 4-1 Estimated Sequoyah 46 m Wind Speed*
 Reference Parameters - Current 10 m Wind Speed
 Last Available 10 m and 46 m Wind Speeds

1. Extract the last available concurrent values of wind speed at 46 m (U_1) and 10 m (U_2), and the current wind speed at 10 m (U_0).
2. Calculate the first estimate of the 46 m wind speed (U_e) using the following equation, with wind speed in m/s:

$$U_e = U_0 (4.79)^{0.64} \ln (U_1/U_2) \quad (\text{m/s})$$

3. If $U_e \geq 22$ m/s, STOP. DO NOT USE THIS TECHNIQUE.
4. If $U_e < 22$ m/s, apply the regression equation from the following set which corresponds to the time elapsed since the observation in Step 1. If the last available observation does not fall on the hour, use the regression equation for the next hour. For example, if the time elapsed is 1 hour and 30 minutes, use the second hour regression equation.

1st hour: $U_p = 0.09 + 0.94 U_e$ (± 0.5 m/s)

2nd hour: $U_p = 0.18 + 0.89 U_e$ (± 0.6 m/s)

3rd hour: $U_p = 0.25 + 0.85 U_e$ (± 0.8 m/s)

4th hour: $U_p = 0.31 + 0.82 U_e$ (± 0.9 m/s)

*Following the equations for the estimated wind speed (U_p) is the number of meters per second on either side of the estimated wind speed needed to give a confidence level of 90 percent.

Table 4-2 Estimated Sequoyah 46 m Wind Speed^{*}
 Reference Parameters - Current 91 m Wind Speed
 Last Available 46 m and 91 m Wind Speeds

1. Extract the last available concurrent values of wind speed at 46 m (U_1) and 91 m (U_2), and the current wind speed at 91 m (U_0).
2. Calculate the first estimate of the 46 m Wind Speed (U_e) using the following equation, with wind speeds in m/s:

$$U_e = U_0 (0.51)^{-1.48 \ln (U_1/U_2)} \quad (\text{m/s})$$

3. If $U_e \geq 22$ m/s, STOP. DO NOT USE THIS TECHNIQUE.
4. If $U_e < 22$ m/s, apply the regression equation from the following set which corresponds to the time elapsed since the observation in Step 1. If the last available observation does not fall on the hour, use the regression equation for the next hour. For example, if the time elapsed is 1 hour and 30 minutes, use the second hour regression equation.

$$\text{1st hour: } U_p = 0.11 + 0.93 U_e \quad (\pm 0.6 \text{ m/s})$$

$$\text{2nd hour: } U_p = 0.23 + 0.87 U_e \quad (\pm 0.8 \text{ m/s})$$

$$\text{3rd hour: } U_p = 0.34 + 0.81 U_e \quad (\pm 0.9 \text{ m/s})$$

$$\text{4th hour: } U_p = 0.42 + 0.77 U_e \quad (\pm 1.0 \text{ m/s})$$

*Following the equations for the estimated wind speed (U_p) the number of meters per second on either side of the estimated wind speed needed to give a confidence level of 90 percent.

Table 4-3 Estimated Sequoyah 46 m Wind Speed (m/s)^{*}
 Reference Parameters-Sequoyah 91 m Wind Speed and
 Sequoyah Stability Class (46-9 m ΔT)

Note: For reference parameter wind speeds which fall between the indicated values, "eyeball" interpolation should be used to obtain the estimated wind speed value.

Table 5-3 Estimated Sequoyah 10 m Wind Speed^{*}
 Reference Parameters - Current 46 m Wind Speed
 Last Available 10 m and 46 m Wind Speeds

1. Extract the last available concurrent values of wind speed at 10 m (U_1) and 46 m (U_2), and the current wind speed at 46 m (U_0).
2. Calculate the first estimate of the 10 m wind speed (U_e) using the following equation, with wind speeds in m/s:

$$U_e = U_0 (0.21)^{-0.64} \ln (U_1/U_2) \quad (\text{m/s})$$
3. If $U_e \geq 22 \text{ m/s}$, STOP. DO NOT USE THIS TECHNIQUE.
4. If $U_e < 22 \text{ m/s}$, apply the regression equation from the following set which corresponds to the time elapsed since the observation in Step 1. If the last available observation does not fall on the hour, use the regression equation for the next hour. For example, if the time elapsed is 1 hour and 30 minutes, use the second hour regression equation.

1st hour: $U_p = 0.17 + 0.95 U_e \quad (+ 0.8 \text{ m/s})$

2nd hour: $U_p = 0.31 + 0.91 U_e \quad (+ 1.0 \text{ m/s})$

3rd hour: $U_p = 0.44 + 0.87 U_e \quad (+ 1.2 \text{ m/s})$

4th hour: $U_p = 0.56 + 0.83 U_e \quad (+ 1.3 \text{ m/s})$

*Following the equations for the estimated wind speed (U_p) is a figure to indicate the number of meters per second on either side of the estimated wind speed needed to give a confidence level of 90 percent.

Table 5-4 Estimated Sequoyah 10 m Wind Speed (m/s)^{*}
 Reference Parameters-Watts Bar 93 m Wind Speed and
 Sequoyah Stability Class (46-9 m ΔT)

Note: For reference parameter wind speeds which fall between the indicated values, "eyeball" interpolation should be used to obtain the estimated wind speed value.

*At the bottom of each column is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.

General Directions

Sections A.2 through A.5 contain background materials for Sections 2 through 5. This includes the more detailed material from which the procedures were developed as well as historical data comparisons used to develop some of the procedures.

The first page of each section is a table of contents for that section. The backup material is arranged with corresponding table numbers (e.g., table A.2-1 contains backup material for the procedures given in table 2-1.)

On several of the tables, the Sequoyah stability class (46-9 m ΔT) is given as I-L, which stands for intermediate minus lower. Also, the headings on some of the computer products incorrectly list the Sequoyah 9 m and Watts Bar 91 m temperature sensor heights as 10 and 93 meters, respectively (Tables A.2-1a through A.2-1e). In Table A.2-3, the Sequoyah 9.73 m wind speed sensor height is incorrectly given as 9.25 m (which is the temperature sensor height). These values will be corrected when the manual is revised.

Sequoyah Stability Class (46-9 m ΔT)

This section contains background material for the procedures in section 2, with corresponding table numbers.

Reference Parameter	Table No.
1. Sequoyah 91-9 m ΔT	A.2-1a
2. Watts Bar 46-10 m ΔT	A.2-1b
3. Sequoyah 10 m wind speed (WS), Time of day, Month	A.2-2
WS \leq 2.2 m/s (5 mi/h)	Block 1
2.2 m/s < WS \leq 4.5 m/s (10 mi/h)	Block 2
WS > 4.5 m/s	Block 3
4. Watts Bar 91-10 m ΔT	A.2-1c
5. Sequoyah 91-46 m ΔT	A.2-1d
6. Watts Bar 91-46 m ΔT	A.2-1e
7. Time of Day	A.2-3

- A: The first column is the estimated stability class.
- B: The second column is the percentage of time that the estimated stability class was the same as the actual stability class.
- C: The third column is the percentage of time that the estimated value was within ± 1 stability class.

March

A: The first column is the estimated stability class.

B: The second column is the percentage of time that the estimated stability class was the same as the actual stability class.

C: The third column is the percentage of time that the estimated value was within ± 1 stability class.

Note: A "-" in columns A-C indicates that there were no data values in the data set for this wind speed category for this hour.

Sequoyah 46 m Wind Direction

This section contains background material for the procedures in section 3, with corresponding table numbers.

Reference Parameter	Table No.
All Wind Speeds	
1. SQN 91 m WD	A.3-1a
2. SQN 10 m WD	A.3-1b
3. WBN 93 m WD	A.3-1c
4. WBN 46 m WD	A.3-1d
5. WBN 10 m WD	A.3-1e
Reference Parameter WS \leq 2.2 m/s	
6. SQN 10 m WD and WS	A.3-2b
7. SQN 91 m WD and WS	A.3-2a
8. WBN 46 m WD and WS	A.3-2d
9. WBN 93 m WD and WS	A.3-2c
10. WBN 10 m WD and WS	A.3-2e
Reference Parameter WS > 2.2 m/s (5 mi/h)	
11. SQN 10 m WD and WS	A.3-3b
12. SQN 91 m WD and WS	A.3-3a
13. WBN 10 m WD and WS	A.3-3e
14. WBN 46 m WD and WS	A.3-3d
15. WBN 93 m WD and WS	A.3-3c
16. Time of Day	A.3-4

WD = Wind Direction

WS = Wind Speed

Sequoyah 46 m Wind Speed

This section contains background material for the procedures in Section 4, with corresponding table numbers.

Reference Parameter	Table No. [*]
1. SQN 91 m WS & 46-9 ΔT	A.4-3
2. SQN 91 m WS	A.4-3
3. SQN 10 m WS & 46-9 m ΔT	A.4-4
4. SQN 10 m WS	A.4-4
5. WBN 93 m WS & SQN 46-9 m ΔT	A.4-5
6. WBN 46 m WS & SQN 46-9 m ΔT	A.4-6
7. WBN 46 m WS	A.4-6
8. WBN 93 m WS	A.4-5
9. WBN 10 m WS & SQN 46-9 m ΔT	A.4-7
10. WBN 10 m WS	A.4-7

WS = Wind Speed

*No background material is provided for tables A.4-1 and A.4-2.

Table A.4-3 Estimated Sequoyah 46 m Wind Speed Using Sequoyah
91 m Wind Speed and Sequoyah I-L Stability Class

This procedure uses the following linear regression equations to estimate the Sequoyah 46 m wind speed (U_e) in m/s, using the Sequoyah 91 m wind speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class	Equation *
A	$U_e = 0.243 + 0.854 U_o$ (± 0.5 m/s)
B	$U_e = 0.201 + 0.853 U_o$ (± 0.5 m/s)
C	$U_e = 0.145 + 0.852 U_o$ (± 0.5 m/s)
D	$U_e = 0.021 + 0.847 U_o$ (± 0.5 m/s)
E	$U_e = -0.099 + 0.802 U_o$ (± 0.7 m/s)
F	$U_e = 0.235 + 0.650 U_o$ (± 0.9 m/s)
G	$U_e = 0.212 + 0.610 U_o$ (± 1.0 m/s)
All Classes	$U_e = -0.045 + 0.826 U_o$ (± 0.8 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.

Table A.4-4 Estimated Sequoyah 46 m Wind Speed Using Sequoyah 10 m Wind Speed and Sequoyah I-L Stability Class

This procedure uses the following linear regression equations to estimate the Sequoyah 46 m wind speed (U_e) in m/s, using the Sequoyah 10 m wind speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class	Equation*
A	$U_e = -0.353 + 1.585 U_o$ (+ 0.8 m/s)
B	$U_e = -0.468 + 1.596 U_o$ (+ 0.8 m/s)
C	$U_e = -0.545 + 1.624 U_o$ (+ 0.8 m/s)
D	$U_e = -0.062 + 1.612 U_o$ (+ 0.8 m/s)
E	$U_e = 0.335 + 1.703 U_o$ (+ 0.8 m/s)
F	$U_e = -0.005 + 2.115 U_o$ (+ 0.9 m/s)
G	$U_e = 0.204 + 1.970 U_o$ (+ 1.2 m/s)
All Classes	$U_e = 0.398 + 1.487 U_o$ (+ 1.1 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated values needed to give a confidence level of 90 percent.

Table A.4-5 Estimated Sequoyah 46 m Wind Speed Using Watts Bar
93 m Wind Speed and Sequoyah I-L Stability Class

This procedure uses the following linear regression equations to estimate the Sequoyah 46 m Wind Speed (U_e) in m/s, using the Watts Bar 93 m Wind Speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class	Equation*
A	$U_e = 1.218 + 0.741 U_o$ (+ 1.6 m/s)
B	$U_e = 0.975 + 0.744 U_o$ (+ 1.7 m/s)
C	$U_e = 0.860 + 0.740 U_o$ (+ 1.7 m/s)
D	$U_e = 1.042 + 0.720 U_o$ (+ 1.9 m/s)
E	$U_e = 0.997 + 0.637 U_o$ (+ 1.8 m/s)
F	$U_e = 1.134 + 0.496 U_o$ (+ 1.4 m/s)
G	$U_e = 1.088 + 0.482 U_o$ (+ 1.4 m/s)
All Classes	$U_e = 0.940 + 0.695 U_o$ (+ 1.8 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.

Table A.4-6 Estimated Sequoyah 46 m Wind Speed Using Watts Bar
46 m Wind Speed and Sequoyah I-L Stability Class

This procedure uses the following linear regression equations to estimate the Sequoyah 46 m Wind Speed (U_e) in m/s, using the Watts Bar 46 m Wind Speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class		Equation*
A	$U_e = 1.083 + 0.844 U_o$	(\pm 1.6 m/s)
B	$U_e = 0.823 + 0.865 U_o$	(\pm 1.7 m/s)
C	$U_e = 0.746 + 0.860 U_o$	(\pm 1.7 m/s)
D	$U_e = 1.173 + 0.831 U_o$	(\pm 1.9 m/s)
E	$U_e = 1.333 + 0.760 U_o$	(\pm 1.8 m/s)
F	$U_e = 1.514 + 0.615 U_o$	(\pm 1.5 m/s)
G	$U_e = 1.460 + 0.628 U_o$	(\pm 1.5 m/s)
All Classes	$U_e = 1.234 + 0.794 U_o$	(\pm 1.8 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.

Table A.4-7 Estimated Sequoyah 46 m Wind Speed Using Watts Bar 10 m Wind Speed and Sequoyah I-L Stability Class

This procedure uses the following linear regression equations to estimate the Sequoyah 46 m Wind Speed (U_e) in m/s, using the Watts Bar 10 m Wind Speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class	Equation*
A	$U_e = 0.587 + 1.161 U_o$ (+ 1.6 m/s)
B	$U_e = 0.396 + 1.181 U_o$ (+ 1.7 m/s)
C	$U_e = 0.346 + 1.186 U_o$ (+ 1.7 m/s)
D	$U_e = 1.176 + 1.079 U_o$ (+ 2.0 m/s)
E	$U_e = 1.605 + 0.995 U_o$ (+ 2.0 m/s)
F	$U_e = 1.676 + 0.882 U_o$ (+ 1.7 m/s)
G	$U_e = 1.581 + 1.003 U_o$ (+ 1.6 m/s)
All Classes	$U_e = 1.439 + 0.978 U_o$ (+ 1.9 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.

Sequoyah 10 m Wind Speed

This section contains background material for the procedures in section 5, with corresponding table numbers.

<u>Reference Parameter</u>	<u>Table No.</u> [*]
1. SQN 46 m WS & SQN 46-9 m ΔT	A.5-1
2. SQN 91 m WS & SQN 46-9 m ΔT	A.5-2

9. WBN 46 m WS	A.5-5
10. WBN 93 m WS	A.5-4

WS = Wind Speed

*No background material is provided for table 5-3.

Table A.5-1 Estimated Sequoyah 10 m Wind Speed Using Sequoyah 46 m Wind Speed and Sequoyah I-L Stability Class.

This procedure uses the following linear regression equations to estimate the Sequoyah 10 m Wind Speed (U_e) in m/s, using the Sequoyah 46 m Wind Speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class	Equation *
A	$U_e = 0.482 + 0.568 U_o$ (+ 0.5 m/s)
B	$U_e = 0.504 + 0.568 U_o$ (+ 0.5 m/s)
C	$U_e = 0.515 + 0.564 U_o$ (+ 0.5 m/s)
D	$U_e = 0.210 + 0.576 U_o$ (+ 0.5 m/s)
E	$U_e = -0.058 + 0.545 U_o$ (+ 0.5 m/s)
F	$U_e = 0.272 + 0.365 U_o$ (+ 0.4 m/s)
G	$U_e = 0.356 + 0.308 U_o$ (+ 0.5 m/s)
All Classes	$U_e = 0.033 + 0.583 U_o$ (+ 0.7 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.

Table A.5-2 Estimated Sequoyah 10 m Wind Speed Using Sequoyah
91 m Wind Speed and Sequoyah I-L Stability Class

This procedure uses the following linear regression equations to estimate the Sequoyah 10 m Wind Speed (U_e) in m/s, using the Sequoyah 91 m Wind Speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class		Equation*
A	$U_e = 0.598 + 0.490 U_o$	(± 0.5 m/s)
B	$U_e = 0.612 + 0.487 U_o$	(± 0.6 m/s)
C	$U_e = 0.594 + 0.482 U_o$	(± 0.6 m/s)
D	$U_e = 0.234 + 0.485 U_o$	(± 0.6 m/s)
E	$U_e = -0.080 + 0.429 U_o$	(± 0.7 m/s)
F	$U_e = 0.399 + 0.224 U_o$	(± 0.5 m/s)
G	$U_e = 0.475 + 0.172 U_o$	(± 0.6 m/s)
All Classes	$U_e = 0.098 + 0.460 U_o$	(± 1.0 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.

Table A.5-4 Estimated Sequoyah 10 m Wind Speed Using Watts Bar
93 m Wind Speed and Sequoyah I-L Stability Class

This procedure uses the following linear regression equations to estimate the Sequoyah 10 m Wind Speed (U_e) in m/s, using the Watts Bar 93 m Wind Speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class	Equation*
A	$U_e = 1.103 + 0.438 U_o$ (± 1.0 m/s)
B	$U_e = 0.984 + 0.444 U_o$ (± 1.0 m/s)
C	$U_e = 0.968 + 0.427 U_o$ (± 1.0 m/s)
D	$U_e = 0.790 + 0.420 U_o$ (± 1.2 m/s)
E	$U_e = 0.485 + 0.357 U_o$ (± 1.1 m/s)
F	$U_e = 0.686 + 0.181 U_o$ (± 0.6 m/s)
G	$U_e = 0.663 + 0.160 U_o$ (± 0.6 m/s)
All Classes	$U_e = 0.581 + 0.406 U_o$ (± 1.3 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.

Table A.5-5 Estimated Sequoyah 10 m Wind Speed Using Watts Bar
46 m Wind Speed and Sequoyah I-L Stability Class

This procedure uses the following linear regression equations to estimate the Sequoyah 10 m wind speed (U_e) in m/s, using the Watts Bar 46 m wind speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class	Equation*
A	$U_e = 1.022 + 0.500 U_o$ (± 1.0 m/s)
B	$U_e = 0.893 + 0.516 U_o$ (± 1.0 m/s)
C	$U_e = 0.881 + 0.502 U_o$ (± 1.1 m/s)
D	$U_e = 0.838 + 0.494 U_o$ (± 1.2 m/s)
E	$U_e = 0.645 + 0.424 U_o$ (± 1.0 m/s)
F	$U_e = 0.798 + 0.241 U_o$ (± 0.6 m/s)
G	$U_e = 0.751 + 0.235 U_o$ (± 0.6 m/s)
All Classes	$U_e = 0.651 + 0.501 U_o$ (± 1.1 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.

Table A.5-6 Estimated Sequoyah 10 m Wind Speed Using Watts Bar
10 m Wind Speed and Sequoyah I-L Stability Class

This procedure uses the following linear regression equations to estimate the Sequoyah 10 m wind speed (U_e) in m/s, using the Watts Bar 10 m wind speed (U_o) in m/s, and the Sequoyah I-L Stability Class.

SQN I-L Stability Class	Equation*
A	$U_e = 0.737 + 0.683 U_o$ (± 1.0 m/s)
B	$U_e = 0.634 + 0.705 U_o$ (± 1.0 m/s)
C	$U_e = 0.647 + 0.692 U_o$ (± 1.1 m/s)
D	$U_e = 0.809 + 0.652 U_o$ (± 1.2 m/s)
E	$U_e = 0.766 + 0.572 U_o$ (± 1.1 m/s)
F	$U_e = 0.837 + 0.372 U_o$ (± 0.7 m/s)
G	$U_e = 0.764 + 0.419 U_o$ (± 0.7 m/s)
All Classes	$U_e = 0.691 + 0.662 U_o$ (± 1.1 m/s)

Period of Record: January 1, 1977-December 31, 1980

*To the right of each equation is a figure to indicate the number of meters per second on either side of the estimated value needed to give a confidence level of 90 percent.
