**Subject: Beaver Valley Power Station, Unit No. 2
Docket No. 50-412, License No. NPF-73
IST (Inservice Test) Program; Proposed Revision 2C**

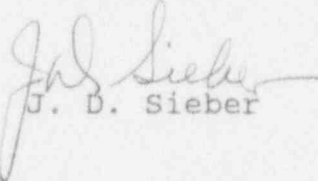

The purpose of this submittal is to request NRC review and approval of Proposed Revision 2C to the Unit No. 2 IST Program.

Six isolation valves located between the demineralized water header and the recirculation spray system are going to be added to the IST Program and leak tested during the fifth refueling outage. However, four of these valves are in parallel configurations and cannot be individually leak tested. Therefore, we have prepared and attached two relief requests that would permit assigning a maximum permissible leakage rate for the parallel valves as a unit.

It is requested that the NRC complete the review of these proposed relief requests in time to support testing during the fifth refueling outage. Approval before January 31, 1995, will provide sufficient preparation time for the refueling outage tentatively scheduled to begin March 24, 1995.

If you have any questions on this matter, please contact Mr. Steve Sovick at (412) 393-5211.

Sincerely,

J. D. Sieber
