## AVAILABILITY NOTICE

### Availability of Reference Materials Cited in NRC Publications

Most documents cited in NRC publications can be available from one of the following sources:

1. The NRC Public Document Room, 2120 L Street NW, Lower Level, Washington, DC 20555
2. The Superintendent of Documents, U.S. Government Printing Office, P.O. Box 37082, Washington, DC 20013-7082
3. The National Technical Information Service, Springfield, VA 22161

Although the listing that follows represents the majority of documents cited in NRC publications, it is not intended to be exhaustive.

Referenced documents available for inspection and copying for a fee from the NRC Public Document Room include NRC correspondence and internal NRC memoranda; NRC Office of Inspection and Enforcement bulletins, circulars, information notices, inspection and investigation notices; Licensee Event Reports; vendor reports and correspondence; Commission papers; and applicant and licensee documents and correspondence.

The following documents in the NUREG series are available for purchase from the GPO Sales Program: formal NRC staff and contractor reports; NRC-sponsored conference proceedings, and NRC booklets and brochures. Also available are Regulatory Guides, NRC regulations in the Code of Federal Regulations, and Nuclear Regulatory Commission Issuances.

Documents available from the National Technical Information Service include NUREG series reports and technical reports prepared by other federal agencies and reports prepared by the Atomic Energy Commission, forerunner agency to the Nuclear Regulatory Commission.

Documents available from public and special technical libraries include all open literature items, such as books, journal and periodical articles, and transactions. Federal Register notices, federal and state legislation, and congressional reports can usually be obtained from these libraries.

Documents such as theses, dissertations, foreign reports and translations, and non-NRC conference proceedings are available for purchase from the organization sponsoring the publication cited.

Single copies of NRC draft reports are available free, to the extent of supply, upon written request to the Office of Information Resources Management, Distribution Section, U.S. Nuclear Regulatory Commission, Washington, DC 20555.

Copies of industry codes and standards used in a substantive manner in the NRC regulatory process are maintained at the NRC Library, 7920 Norfolk Avenue, Bethesda, Maryland, and are available there for reference use by the public. Codes and standards are usually copyrighted and may be purchased from the originating organization or, if they are American National Standards, from the American National Standards Institute, 1430 Broadway, New York, NY 10018.

## ABSTRACT

This report presents the volume, activity, and radionuclide distributions in low-level radioactive waste (LLW) disposed during 1987 through 1989 at the commercial disposal facilities located near Barnwell, SC, Richland, WA, and Beatty, NV. The report has been entirely assembled from descriptions of waste provided in LLW shipment manifests. Individual radionuclide distributions are listed as a function of waste class, of general industry, and of waste stream. In addition, information is presented about disposal of wastes containing chelating agents, about use of solidification media, about the distribution of radiation levels at the surfaces of waste containers, and about the distribution of waste container sizes. Considerably more information is presented about waste disposed at the Richland and Beatty disposal facilities than at the Barnwell disposal facility.

## ACKNOWLEDGMENTS

The author would like to thank the following individuals for their assistance in assembling the data included in this report: Jimmy Still and Sybil Horton of Chem-Nuclear Systems, Inc.; Caroline Martinson, Paul Olliges, and Jay Stovall of U.S. Ecology, Inc.; and Melinda Renner and Jean Hawes of the Utility Data Institute. The author would also like to thank Sharlene McCubbin of the Nuclear Regulatory Commission's (NRC) Division of Contracts and Property Management, Office of Administration; Veta Everett of NRC's Program Implementation Branch, Office of Nuclear Material Safety and Safeguards (NMSS); and Ellen Kraus, the NMSS editor.

## 1. INTRODUCTION

This report presents the volume, activity, and radionuclide distributions in low-level waste (LLW) disposed during 1987 through 1989 at the commercial disposal facilities located near Barnwell, SC, Richland, WA, and Beatty, NV. The report has been prepared as a source of general LLW data for use by regulatory agencies, disposal facility developers, consultants, and others.

The report begins with a section discussing the derivation of the assembled data. The report then presents the following sections:

- Basic volume and activity distributions
- Volume and activity distributions per general industry
- Volumes and gross activities per waste stream
- Radionuclides in LLW in significant quantities
- Distribution of long-lived radionuclides
- Other information
- References

The report includes a glossary and six appendices. The glossary summarizes the elemental abbreviations used in the report. Appendices A through C list individual radionuclide distributions as a respective function of waste class, general industry, and waste stream. Although the first of these three appendices provides data for all three disposal facilities, the last two appendices provide data for only the Richland and Beatty facilities. Appendix D provides additional information about waste disposed during 1989 at the Richland facility; it lists radionuclide distributions as a function of waste stream and general industry. Appendix E provides general information about use of sorbent and solidification media at the Richland and Beatty facilities. Appendix F expands the information in Appendix E by listing radionuclide distributions as a function of sorbent and solidification media for the Richland facility. All appendices except Appendices D and F consider the years 1987 through 1989; Appendices D and F consider 1989 only.

## 2. DERIVATION OF REPORT INFORMATION

This report has been entirely assembled from descriptions of waste provided in manifests accompanying LLW shipments to LLW disposal facilities.

Each shipment to a LLW disposal facility is accompanied by manifests and other documentation that describe the shipment contents. Manifests are large, detailed documents containing information required by Nuclear Regulatory Commission (NRC) regulations in Title 10, Code of Federal Regulations, Part 20 (10 CFR Part 20), Department of Transportation Regulations in 49 CFR Part 172, and State regulations and requirements. A manifest consists of a title page, which presents information applicable to the shipment as a whole, plus one or

more continuation sheets, which describe individual containers of waste. A bill of lading must also be included as required by the Interstate Commerce Commission in 49 CFR Part 1054. Additional documentation is usually required by disposal facility license condition.

Three LLW disposal facilities currently operate: the Barnwell, SC disposal facility operated by Chem-Nuclear Systems, Inc. (CNSI), and the Richland, WA, and Beatty, NV, facilities operated by U.S. Ecology, Inc. (USE). Upon receipt of a shipment of LLW, disposal facility operators perform quality control checks on the shipment and the information in the manifest, and transcribe portions of the manifest information into computer recordkeeping systems. The disposal facility operators have independently developed these computer systems to assist them in business activities and in making reports as required by NRC and State regulations and disposal facility license conditions. The computer systems are necessary to store and process the manifest information, which is voluminous. Each year the operators receive thousands of shipment manifests, and each manifest consists of several sheets of paper filled with detailed information about the waste.

Both disposal facility operators carry out quality control procedures to check the accuracy of the information transcription process. USE transcribes any radionuclide having an activity of one microcurie or less as one microcurie. CNSI transcribes the most significant radionuclides, either in terms of quantity or radiological hazard. Some adjustment is performed on very short-lived radionuclides to avoid round-off errors when summing over the individual radionuclides in the shipment.

Over the past several years, NRC has purchased microfiche copies of shipment manifests from the disposal facility operators, as well as computer printouts of the LLW data sorted in different ways. In addition, NRC has contracted with the Utility Data Institute (UDI) to access USE's WASTENET computer system for the Richland and Beatty disposal facilities. (UDI markets a limited number of programs for the WASTENET system based on an agreement with USE.)

These computer systems were created and are owned by the disposal facility operators. Some of the computer printouts, as well as many of the microfiched shipment manifests, contain information that the operators consider copyrighted or business proprietary information. Such information has been excluded from this report.

In assembling the data for this report, the author did not attempt to verify the accuracy of the information reported by waste generators on shipment manifests. In general, therefore, the author presents information as it was provided by the disposal facility operators. But the author did review the results of different printouts to ensure that the information in the printouts was consistent. As part of this process, a few matters came to light that bear mentioning.

First, this report contains considerably more information about waste delivered to the USE disposal facilities than to the CNSI disposal facility. This is mainly because the operators' computer systems store different information in different formats. CNSI was the first operator to develop a computer system to

store manifest information, whereas USE followed a number of years later. The CNSI system stores less information than does the USE system. Furthermore, the CNSI system stores manifest information as summarized across the entire shipment, which makes it difficult to consistently associate a particular type or class of waste with a given container in a shipment. (And has apparently contributed to a few minor discrepancies which may be observed in this report.) Without laboriously reviewing shipment manifests, one cannot precisely determine the radionuclide distributions in different waste streams if more than one waste stream is included in a particular shipment. The newer USE system stores information on a waste container basis. The USE manifest contains features such as index codes that ease computer storage and information processing.

In addition, the wastes are described differently depending on the manifest form. Each operator specifies use of a particular manifest form, and although the manifests used by the two operators are similar, they are not identical (more on this later).

Another consideration is the mutable nature of the data stored in the operators' computer systems. Changes may occur, for example, because subsequent to waste disposal, a waste generator sends a modified shipment manifest to a disposal facility operator. These modifications might reflect an improved estimate of the radionuclide distribution in waste. Consequently, the results of computer programs run today may differ slightly from those run tomorrow, and the data used to prepare this report were assembled over 3 years.

Furthermore, the information provided in LLW shipment manifests is imprecise, reflecting uncertainties in measurements. Although a radioactive isotope is not necessarily absent merely because one hasn't looked for it, the author believes that the radionuclide inventories listed in shipment manifests tend to be conservative. This conservatism can be extreme for radionuclides such as I-129 that are contained in trace quantities in waste and cannot be readily measured using nondestructive measurement techniques. Generators usually estimate the concentrations of these radionuclides in waste by scaling to other, easy-to-measure radionuclides such as Cs-137. Scaling factors are determined by obtaining waste samples and by measuring for the radionuclides of interest using complex radiochemical techniques. The results of the analyses are often below the lower limit of detection (LLD) for the analysis technique. By basing scaling factors on LLD values, generators can exaggerate the reported quantities of these radionuclides by factors considerably greater than 10. (See References 1 and 2.)

Because of these uncertainties, the information in the main body of this report is usually presented in exponential notation using a limited number of significant figures. But this leads to a quandary: too many significant figures implies an inflated accuracy; too few leads to round-off errors. As a compromise, four significant figures are normally used.

All volumes are in units of cubic feet rather than cubic meters, because a cubic foot is the volume unit used on shipment manifests. These volumes all refer to the envelope volume of the container in which the waste is shipped, rather than the volume of the waste within the container. For most wastes, the

volume of the waste will not differ dramatically from that of the container, although activated metal wastes are a notable exception. (These wastes are typically materials such as tubing that contain large voids. The ratio of the waste "full-density" volume -- the volume represented by the elimination of all voids -- to the volume of the waste container seldom exceeds 15 percent.)

All radionuclide activities in the main report are in units of curies (Ci), as are activities in Appendix A. Activities in Appendices B through F are in units of millicuries (mCi). The older curie and millicurie units are used in this report, rather than the newer Becquerel units, because the older units are still customarily used on shipment manifests.

### 3. BASIC VOLUME AND ACTIVITY DISTRIBUTIONS

Tables 1 through 3 summarize gross volume and activity distributions for the three disposal facilities for the years 1987 through 1989. For these three years, the total waste volume varied over a range of about 420,000 ft<sup>3</sup>, from a low of 1,430,000 ft<sup>3</sup> to a high of 1,850,000 ft<sup>3</sup>. The activity, however, experienced a more dramatic change. Although the total waste activity reported during 1987 was 270,000 Ci, and during 1988 was 260,000 Ci, the total waste activity reported during 1989 was 870,000 Ci. That is, the total waste activity for 1989 was three times that for either 1987 or 1988. Using 1988 as a comparison, the total 1989 activity rose by a factor of nearly five for the Beatty facility, a factor of 3.1 for the Richland facility, and a factor of 3.3 for the Barnwell facility. Of note is the 476,000-curie increase in Class C waste activity at the Barnwell facility, which resulted generally from disposal of activated metals dominated by isotopes having short half-lives.

The fractional distribution of the waste volume among the three waste classes is similar for all three years. Class A waste comprises 96-97 percent of the volume, Class B waste 2-3 percent, and Class C waste 0.5-1 percent. However, the fractional distribution of the waste activity differs. In 1987 and 1988, Class A waste comprised 10-11 percent of the activity, Class B waste 23-25 percent, and Class C waste 65-66 percent. In 1989, more activity shifted to Class C waste. Seventy-eight percent of the activity was in Class C waste, whereas only 19 percent was in Class B waste and 3 percent in Class A waste.

Tables 4 through 6 present the same data as do Tables 1 through 3, but the focus is different. That is, Tables 4 through 6 emphasize the comparison of one disposal facility with another. The Barnwell facility consistently received over half the waste volume and over three-quarters of the waste activity.

(Information about isotopic distributions in LLW is provided in Appendix A. This appendix lists inventories of all reported radionuclides as a function of year, disposal facility, and waste class.)

Table 7 provides additional information about the volume and activity distribution in Class A waste. In 10 CFR 61.56, NRC regulations require disposal of Class B and C wastes in a manner that provides structural stability, where structural stability can be provided by the waste form itself,

by processing the waste to a stable form, or by placing the waste in a disposal container or structure that provides stability after disposal.

Waste generators usually provide structural stability by either processing the waste into a stable form or by placing the waste into a high-integrity container (HIC). Although not required by Part 61, Class A wastes are also frequently disposed in a stable form. Over the three years considered, from 43 to 70 percent of the total Class A activity was disposed in a stable form. This is sometimes because of disposal facility license conditions that are more restrictive than Part 61, and sometimes because of operational convenience to a generator.

#### 4. VOLUME AND ACTIVITY DISTRIBUTIONS PER GENERAL INDUSTRY

For each of the three disposal facilities, Tables 8 through 16 summarize the distribution of waste volume and activity as a function of waste class and general category of waste generator. Five categories of waste generators are listed for each table. CNSI denotes these categories as: nuclear utilities, hospitals, colleges, government, and industry (Tables 8 through 10). USE denotes these categories in a similar manner (Tables 11 through 16). For all tables, waste volumes and activities are tracked through any waste brokers and processors back to the original generator. For example, if a nuclear utility sends waste to a processor for compaction, and then the processor sends the waste to a disposal facility, the waste is considered utility waste, rather than industry waste. (Tracking wastes through processors increases the difficulty of minimizing round-off errors during data entry, which can lead to minor computational discrepancies.)

Assuming that the categories denoted by the two operators correspond, the distribution across all disposed waste is estimated by combining the information in the nine tables. The results are in Tables 17 and 18.

Table 17 compares volumes and activities as a function of general industry and waste class. Utilities consistently generated the bulk of the waste volume and activity. For each year from 1987 through 1989, utilities generated from 52 to 57 percent of the volume and from 82 to 84 percent of the activity. Most of this activity was short-lived and was contained in Class C waste. Much of the remaining volume and activity was generated by industrial generators.

Table 18 compares volumes and gross activities as a function of general industry and disposal facility. Waste from different industries are distributed unequally among the three disposal facilities. For example, most of the waste volume and activity generated by nuclear utilities was delivered to the Barnwell facility. Depending on the year, Barnwell received from 65 to 78 percent of the utility waste volume and from 91 to 95 percent of the utility waste activity. Most of this activity was from short-lived isotopes such as Co-60. The Barnwell facility also received most of the activity generated by government generators, although not necessarily most of the volume. On the other hand, Barnwell received a small fraction of the waste generated by hospitals. Depending on the year, Barnwell received only 3 to 6 percent of the hospital waste volume and from 0.1 to 2 percent of the hospital waste activity. Most of the hospital waste volume was delivered to the Richland facility, and,

a. B: Barnwell; R: Richland; Be: Beatty.

except for 1989, most of the hospital waste activity as well. The Richland facility received most of the activity delivered by industrial generators, but not most of the volume.

Appendix B provides an isotopic distribution as a function of waste class and general industry for the two USE disposal facilities. Unfortunately, a similar distribution is not available for the Barnwell facility. If it were available, an instructive exercise would be to sum the isotopic distribution for each radionuclide and industry category and perform decay calculations. Eventually, most LLW activity will probably reside in waste delivered from industrial generators.

## 5. VOLUMES AND GROSS ACTIVITIES PER WASTE STREAM

This section presents the distribution of waste volume and gross activity as a function of waste stream for each of the three disposal facilities. Descriptions of the waste streams are provided in Table 19.

Waste descriptions for the Richland and Beatty facilities differ from those for the Barnwell facility. The shipment manifest for the USE facilities incorporates an index system whereby the shipper selects the description most appropriate to the waste from a short list printed on the manifest form. This list includes filter media, dewatered resin, compacted dry active waste, and so forth. Starting in 1988, this list was augmented by several waste descriptions. The CNSI manifest merely provides a space for the waste description. When the shipment manifest arrives at the Barnwell facility, CNSI staff assigns the waste to one of a short list of waste categories based on the shipper's description. These waste categories are the same for all 3 years considered in this report.

Tables 20 through 25 present data for the Barnwell facility in two ways. Tables 20, 22, and 24 present volumes and activities for each waste stream as a function of waste class. Tables 21, 23 and 25 are limited to waste volumes but provide more information about the physical form of the waste. For example, information is provided about any solidification medium used. In addition, a distinction is made between fuel cycle and non-fuel cycle waste, where fuel cycle waste consists of waste from nuclear utilities and uranium fuel fabrication plants.

Tables 26 through 31 present waste volume and activity data for the Richland facility, whereas Tables 32 through 37 present waste volume and activity data for the Beatty facility. For Tables 26 through 37, additional information about the radionuclide distributions in individual waste streams is provided in Appendix C. For waste disposed during 1989 at the Richland facility, Appendix D lists radionuclide distributions as a function of waste stream and general industry. Additional information about the use of solidification and absorbent media at the Richland and Beatty facilities is provided in Appendices E and F.

The tables indicate that activated metals consistently account for most of the activity in LLW. In 1987, activated metals comprised at least 56 percent of all LLW activity. In 1988, activated metals accounted for 58 percent of all LLW activity and only 0.1 percent of the volume. In 1989, activated metals

accounted for 74 percent of all LLW activity and only 0.3 percent of the volume. Most of this activity consists of short-lived radionuclides such as Co-60 or Fe-55. (For 1987, activated metal information is readily available only for the Barnwell facility. During this year, "equipment and components" comprised 72 percent of the activity delivered to Barnwell and only 0.2 percent of the volume. Activated metals were not specifically identified on USE's 1987 manifests, although in its computer system USE tracked the activity of Ni-63 in activated metals. This activity totaled only 167.6 curies, all delivered in Class C waste to Richland.)

The tables also indicate that wastes accounting for much of the volume and activity are described in only general terms. For such wastes, it is more difficult to estimate the propensity for release of radioactivity to the environment through mechanisms such as leaching by water. During 1987, for example, 75 percent of the waste volume and 41 percent of the waste activity delivered to the Richland facility was described as a "dry solid." During this year, 85 percent of the volume delivered to Beatty waste was described as a dry solid, as was 86 percent of the activity. During 1989, 37 percent of the volume and 58 percent of the activity delivered to Richland was described as a dry solid, as was 47 percent of the volume and 86 percent of the activity delivered to Beatty.

## 6. RADIONUCLIDES IN LLW IN SIGNIFICANT QUANTITIES

Tables 38 through 40 list, in terms of activity, the most significant radionuclides in LLW, which for these tables is assumed to be those radionuclides in quantities of at least 100 curies. The tables represent the total activity disposed in all three disposal facilities. Depending on the year, the listed radionuclides represent from 99.6 to 99.9 percent of all LLW activity.

Each year, most of the activity in LLW is contributed by only a handful of radionuclides. Cobalt-60 and Fe-55 accounted for 55 to 76 percent of all activity. These two radionuclides, plus tritium and Mn-54, accounted for 77 to 90 percent of all LLW activity. Eight radionuclides consistently accounted for over 90 percent of the activity: Co-58, Co-60, Cs-137, Fe-55, H-3, Mn-54, Ni-63, and Zn-65. In fact, these radionuclides contributed 95 percent of the activity in 1987, 91 percent in 1988, and 97 percent in 1989.

## 7. DISTRIBUTION OF LONG-LIVED RADIONUCLIDES

Tables 41 through 43 present, by year, the distribution of long-lived radionuclides over the three Part 61 waste classes, where a long-lived radionuclide is taken to be one having a half-life of about 100 years.

The concept of a long-lived radionuclide may vary depending upon the context in which a radionuclide is considered. For example, one might use one definition for "long-lived" if one were storing waste from a medical diagnostic procedure for decay pending disposal as ordinary trash. One might use another definition if one were considering decay of LLW after it had been delivered to a disposal facility.

Table 38. 1987 Radionuclides in Quantities Exceeding 100 Curies

a. Th-NAT: natural thorium; TRU-NOS: unspecified trans-uranic isotopes; U-DEP: depleted uranium; U-NAT: natural uranium.

But for this report, the 100-year half-life criterion was chosen largely as a means of illustrating a few points. As indicated in Tables 41 through 43, with the exception of Ni-63, which has a 100-year half-life, most of the long-lived activity resides in Class A waste. Class C waste initially contains most of the LLW activity, followed by Class B waste and then Class A waste. But eventually, Class A waste will contain most of the activity, followed by Class C waste. Class B waste will contain the least activity.

It would be an instructive exercise to perform decay calculations to determine when the cross-over points occur. The results of a simple analysis, in which individual radionuclides were decayed without regard to decay chains, suggest that for all three years, Class B waste decays to the level of Class A waste after about 100 years. For waste disposed in 1987 and 1988, the Class C waste activity decays to the level of Class A waste activity after about 300 years. For waste disposed in 1989, the Class C waste activity decays to the level of the Class A waste activity after about 500 years.

The data also suggest that the principal reason that it takes so long for Class C waste to decay to Class A levels is Ni-63. Nickel-63 has a half-life of about 100 years and is principally found in Class C waste. (Over the three years considered, from 78 to 90 percent of the Ni-63 activity was delivered in Class C waste.) It is a weak beta-emitter (0.067 MeV maximum) and does not emit gamma radiation. It is principally generated by nuclear power plants, mostly in activated metal wastes but also in process and dry active wastes. In 1987, about 72 percent of all Ni-63 activity was found in activated metal wastes.

Absent Ni-63, most of the long-lived activity in LLW is contributed by Ni-59, C-14, and various uranium and thorium isotopes. Ni-59 is principally reported in activated metal wastes. The other isotopes are found in a number of waste streams. An indication of the distribution of these isotopes among different generators is provided in Table 44.

Table 44 was assembled from data in Appendices A and B, and indicates the percent distribution of a number of radionuclides among five categories of waste generators. The data are for waste delivered to the two USE disposal facilities during 1989. The table also indicates the percentage of each radionuclide that was disposed at these two USE facilities. This gives an indication of the representativeness of the distributions.

Sixty-three percent of the C-14 activity was disposed at the two USE facilities, and of this activity, nearly 90 percent was delivered in waste from industrial generators. For thorium and uranium, however, the distribution is not as clear-cut. Almost all of the long-lived thorium was disposed at the Barnwell disposal facility. But of the thorium activity that was delivered to the two USE facilities, most was contributed by industrial generators. (Thorium, of course, occurs naturally as Th-232. However, in the data obtained from USE, natural thorium was cited separately from Th-232. The separate citations have been retained in this report.)

a. Th-NAT: natural thorium; U-NAT: natural uranium; U-DEP: depleted uranium.

A somewhat similar situation exists for uranium. The bulk of the uranium activity during 1989 was contributed by depleted uranium and U-238. Little depleted uranium was reported for the USE facilities, but of the activity delivered to these facilities in 1989, 97 percent was generated by industrial generators. Only 8 percent of the U-238 activity was disposed at the USE facilities. Of this 26.2 Ci of U-238 activity, nearly 99 percent was generated by industrial generators. A similar distribution is probably applicable to U-238 disposed at the Barnwell facility.

Most of the uranium activity was probably contributed by waste generators outside of the nuclear fuel cycle. Only 3.4 curies of U-235 was disposed in 1989. If one assumes that all U-235 was generated by nuclear fuel cycle activities, then the activity of U-238 that would correspond to the U-235 activity can be estimated by considering typical enrichments. Assuming enrichment to 4 weight-percent U-235, only about 13 curies of U-238 would be disposed. Assuming no enrichment, about 76 curies of U-238 would be disposed. This implies that of the 317 curies of U-238 disposed in 1989, only about 4 to 24 percent of the activity would be generated by nuclear fuel cycle licensees.

#### 8. OTHER INFORMATION

Table 45 summarizes the presence of chelating agents in waste delivered during 1987 through 1989 to the two USE disposal facilities. The table lists volumes, activities, and other information for any waste that contains chelating agents in concentrations exceeding 0.1 percent by weight. One may note that although the current USE manifest contains a waste description specifically for solidified chelates, chelating agents can be delivered in other waste streams as well.

Information about the total number of LLW shipments made to the three disposal facilities is summarized below. Clearly, over the last few years the total number of shipments to the disposal facilities has been considerably reduced.

<u>Year</u>	<u>Barnwell</u>	<u>Richland</u>	<u>Beatty</u>	<u>Total</u>
1987	2,681	2,336	770	5,787
1988	2,734	770	239	3,743
1989	2,997	816	302	4,115

The number of individual waste containers delivered to the two USE disposal facilities is summarized below.

<u>Year</u>	<u>Richland</u>	<u>Beatty</u>	<u>Total</u>
1987	36,973	26,351	63,324
1988	29,634	7,778	37,412
1989	33,675	8,812	42,487

Table 46 summarizes the distribution of waste container volumes for waste delivered to the Richland and Beatty facilities during 1988 and 1989. Over

Table 46. U.S. Ecology 1988 and 1989 Distribution of Waste Container Volumes (ft<sup>3</sup>)

three-quarters of the containers had a volume of 7.5 ft<sup>3</sup>, an unsurprising situation.

Finally, Table 47 provides a distribution of the radiation levels at the surfaces of the waste containers delivered to the Richland and Beatty disposal facilities during 1988 and 1989. Radiation levels are in units of milliRoentgens per hour (mR/hr), and are separated into ten ranges. The table lists the percentage of all containers that had surface radiation levels within each range, as well as the average radiation level within each range. For both years, nearly 90 percent of the waste volume had surface radiation levels less than 100 mR/hr.

APPENDIX A

DISPOSAL FACILITY RADIONUCLIDE DISTRIBUTION BY WASTE CLASS

## APPENDIX A

### DISPOSAL FACILITY RADIONUCLIDE DISTRIBUTION BY WASTE CLASS

This appendix contains nine tables listing radionuclide distributions in low-level waste (LLW) disposed during 1987, 1988, and 1989 in each of the three operating LLW disposal facilities. These disposal facilities are, in tabulated order, the Barnwell, SC, disposal facility operated by Chem-Nuclear Systems, Inc. and the Richland, WA, and Beatty, NV, disposal facilities operated by U.S. Ecology, Inc. Each of the tables lists radionuclide activities in units of curies and as a function of waste class.

The tables were created from lists of radionuclide identities and activities obtained from the disposal facility operators. A few observations are in order.

On U.S. Ecology shipment manifests, shippers identify the physical and chemical characteristics of a container of waste using an index code list. Until 1988, this index code list did not include a waste stream description specifically for activated metal wastes. For these years, U.S. Ecology kept informal track of delivery of activated metal wastes by flagging Ni-63 activities contained in these wastes. Thus, for the Richland and Beatty disposal facilities during 1987, Ni-63 inventories within activated metal wastes are denoted Ni-63AM.

Anomalies in the data can be occasionally observed. Occasionally, for example, inventories of silicon and praseodymium were reported without the isotopic numbers. These nuclides are denoted in these tables with the suffix, -NOS. Also, stable isotopes are sometimes listed. These anomalies do not represent a significant activity

Otherwise, the following abbreviations are used: U-NAT means natural uranium, U-DEP means depleted uranium, Th-NAT means natural thorium (essentially Th-232), and TRU means an unspecified mixture of transuranic isotopes.

APPENDIX B

ISOTOPIC DISTRIBUTION BY WASTE CLASS AND GENERAL INDUSTRY

## APPENDIX B

### ISOTOPIC DISTRIBUTION BY WASTE CLASS AND GENERAL INDUSTRY

This appendix presents isotopic distributions as a function of waste class and general industry for low-level waste disposed at the Richland, WA, and Beatty, NV, disposal facilities during 1987, 1988, and 1989. Isotopic distributions for Class A wastes are divided into two subclasses: Class A wastes that have been disposed in a manner that meets the structural stability requirements of 10 CFR 61.56 (denoted Class AS waste), and Class A wastes that have not been disposed in manner that meets the structural stability requirements of 10 CFR 61.56 (denoted Class AU waste). All isotopic distributions are given in units of millicuries.

Five industry categories are considered: utilities, colleges or universities, hospitals, government, and private industry. For wastes delivered to the disposal facility via a waste broker or a waste processor, the distributions are tracked back to the original generator. For example, if a utility delivers waste to a waste processor who reduces the volume of the waste and ships the processed waste to a disposal facility, the isotopic distributions are herein listed under the utility category rather than the private industry category.

APPENDIX C

ISOTOPIC DISTRIBUTION BY WASTE STREAM FOR U.S. ECOLOGY DISPOSAL FACILITIES

## APPENDIX C

### ISOTOPIC DISTRIBUTION BY WASTE STREAM FOR U.S. ECOLOGY DISPOSAL FACILITIES

This appendix presents radionuclide identities and quantities by waste stream and waste class for low-level wastes disposed during 1987, 1988, and 1989 at the two U.S. Ecology low-level waste disposal facilities. Tables C-1 through C-3 present isotopic distributions, by year, for the Richland, WA, disposal facility. Tables C-4 through C-6 present isotopic distributions, by year, for the Beatty, NV, disposal facility. All isotopic distributions are given in units of millicuries.

In the tables, "Class AS" waste denotes Class A wastes that have been disposed in a manner that meets the structural stability requirements of 10 CFR 61.56. "Class AU" waste denotes Class A wastes that have not been disposed in a manner that meets these structural stability requirements.

On U.S. Ecology shipment manifests, shippers identify the physical and chemical characteristics of a container of waste using an index code list. For wastes disposed during 1987, this index code list included the following waste stream descriptions:

---

Vials	Absorbed aqueous liquid
Dry solid	Absorbed organic liquid
Solidified liquid	Aqueous liquid in vials
Biological waste	Animal carcasses on sorbent
Filter media	Compacted dry active waste
Dewatered resin	Noncompacted dry active waste
Solidified resin	Other
Gas	

---

But starting in 1988, U.S. Ecology changed its shipment manifest to describe the wastes somewhat differently and to include additional waste stream descriptions. Thus, for 1988 and 1989, waste streams are described as follows:

---

Vials	Aqueous liquid in vials in sorbent
Dry solid	Animal carcasses in lime and sorbent
Solidified liquids	Gas
Biological (non-carcass waste)	Evaporator bottoms
Absorbed liquid	Compacted dry active waste
Resin material	Non-compacted dry active waste
Filter media	Cartridge-type filter media
Dewatered resins	Non-cartridge filter media
Solidified resins	Activated reactor hardware
Sorbed aqueous liquid	Solidified chelates
Sorbed non-aqueous liquid	Solidified oil
Non-aqueous liquid in vials in sorbent	Other

---

In early manifests, the index code list did not include a waste description specifically for activated metal wastes. During this time, U.S. Ecology kept informal track of delivery of activated metal wastes by assigning the designation Ni-63AM to Ni-63 disposed in activated metals. Otherwise, the following abbreviations are used in this appendix: TH-NAT denotes natural thorium (essentially Th-232), U-NAT denotes natural uranium, and U-DEP denotes depleted uranium.

APPENDIX D

RICHLAND 1989 RADIONUCLIDE DISTRIBUTION BY WASTE STREAM AND INDUSTRY

## APPENDIX D

### RICHLAND 1989 RADIONUCLIDE DISTRIBUTION BY WASTE STREAM AND INDUSTRY

This appendix presents five tables, each of which lists radionuclide distributions as a function of waste stream and general industry for waste disposed at the Richland, WA, disposal facility during 1989. Waste streams considered in this appendix are identical to those considered for 1989 in Appendix C. The general industries considered are, in order: (1) colleges and universities, (2) government, (3) hospitals, (4) industry, and (5) nuclear utilities. All radionuclide distributions are in units of millicuries (mCi).

## APPENDIX E

### USE OF SOLIDIFICATION AND SORBENT MEDIA AT U.S. ECOLOGY DISPOSAL FACILITIES

This appendix summarizes the volumes and gross activities of low-level wastes disposed at the two U.S. Ecology disposal facilities as a function of year, waste class, waste stream, and solidification or sorbent media. Tables E-1 through E-3 summarize volumes and activities for the Richland, WA, disposal facility, whereas Tables E-4 through E-6 summarize volumes and activities for the Beatty, NV, disposal facility. All volumes are given in units of cubic feet; all activities are given in units of millicuries (mCi).

In U.S. Ecology shipment manifests, shippers signify use of particular waste streams, sorbents, and solidification media by using index code lists. A summary of the allowable waste stream descriptions, which are different for 1987 than for 1988 and 1989, is provided in Appendix C. Allowable descriptions for sorbents and solidification media have also changed during this time. For 1987 manifests, the index code list included the following descriptions:

---

#### Solidification or Absorbent Media:

2 Speedi-Dry	10 Zonolite, Grades 2, 3, 4
3 Celatom (MP-78)	11 Dow Media
4 Floor Dry/Super Fine	12 Cement
5 Hi Dri	13 Asphalt
6 Florco or Florco X	14 Delaware Custom Media
7 Instant-Dri	15 Envirostone
8 Safe-T-Sorb	16 Krolite
9 Oil-Dri (Safe n Dri)	99 Other

---

But for 1988 and 1989 shipments, the index code list was expanded. In addition, a distinction was made between solidification and stabilization media. A stabilization medium has been approved for demonstrating compliance with the structural stability requirements of 10 CFR 61.55. A solidification medium has not been so approved. The sorbents, solidification media, and stabilization media included in these later manifests are as follows:

---

Sorbents:

2 Speedi Dri	8 Safe-T-Sorb	51 Dicalite Dicasorb
3 Celetom	9 Safe-N-Dri	28 Dicaperl HP500
4 Floor Dry/Superfine	22 Opalex	29 Petroset
5 Hi Dri	23 Solid-A-Sorb	30 Petroset II
20 Florco	24 Chemsil 30	31 Aquaset
21 Florco X	25 Chemsil 50	32 Aquaset II
7 Instant Dri	26 Chemsil 3030	33 Safe-T-Set
	27 Dicaperl HP200	95 Other Sorbent

Solidification Media:

34 Aztech (General Electric)	12 Concrete (Structural)	38 Hittman Grout
35 Aquaset I and II	14 Delaware Custom Media	39 Petroset I and II
36 Bitumen (ATI & Waste Chem)	11 Dow Media	40 Safe-T-Set
37 Chem-Nuclear Cement	15 Envirostone	96 Other Solidification Media

Stabilization Media:

41 Aztech (General Electric)	45 Dow Media (Vinyl Ester Styrene)	48 Stock Equipment Cement
42 Oxidized Bitumen (ATI & Waste Chem)	46 Envirostone (U.S. Gypsum Cement)	49 Westinghouse-Hittman Cement
43 Chem-Nuclear Cement	47 LN Technologies Cement	97 Other Stabilization Media
44 Concrete (2500 psi)

APPENDIX F

RICHLAND 1989 RADIONUCLIDE DISTRIBUTION BY SOLIDIFICATION AND SORBENT MEDIA

## APPENDIX F

### RICHLAND 1989 RADIONUCLIDE DISTRIBUTION BY SOLIDIFICATION AND SORBENT MEDIA

This appendix presents two tables which provide radionuclide inventory data as a function of waste stream, waste class, and solidification, stabilization, and sorbent media for waste disposed at the Richland, WA disposal facility during 1989. Table F-1 provides this information as summed over the contribution from all generators who shipped waste to the disposal facility. Table F-2 provides this information for contributions by nuclear utilities. All radionuclide activities are given in units of millicuries (mCi).

A list of the waste streams that may be considered in these tables has been provided on page C-2 of Appendix C. Waste classes correspond to the waste classification system described in 10 CFR 61.55 (Class A, Class B, and Class C wastes), where Class A wastes are subdivided into Class AS wastes and Class AU wastes. Class AS wastes are wastes that have been disposed in a manner consistent with the structural stability requirements of 10 CFR 61.56. Class AU wastes have not been so disposed. A list of the solidification, stabilization, and sorbent media that may be considered in these tables has been provided on page E-2 of Appendix E.

9. SPONSORING ORGANIZATION - NAME AND ADDRESS (If NRC, type "Same as above"; if contractor, provide NRC Division, Office or Region, U.S. Nuclear Regulatory Commission, and mailing address.)

Same as above

10. SUPPLEMENTARY NOTES

11. ABSTRACT (200 words or less)

This report presents the volume, activity, and radionuclide distributions in low-level radioactive waste (LLW) disposed during 1987 through 1989 at the commercial disposal facilities located near Barnwell, SC, Richland, WA, and Beatty, NV. The report has been entirely assembled from descriptions of waste provided in LLW shipment manifests. Individual radionuclide distributions are listed as a function of waste class, of general industry, and of waste stream. In addition, information is presented about disposal of wastes containing chelating agents, about use of solidification media, about the distribution of radiation levels at the surfaces of waste containers, and about the distribution of waste container sizes. Considerably more information is presented about waste disposed at the Richland and Beatty disposal facilities than at the Barnwell disposal facility.

12. KEY WORDS/DESCRIPTORS (List words or phrases that will assist researchers in locating the report.)

Low-level waste	Solidification media
LLW	Radionuclide
Barnwell	Radiation
Richland
