Gentlemen:

Millstone Nuclear Power Station, Unit No. 2
Integrated Leak Rate Testing Schedule

This letter provides notification that NNECO intends to perform an Integrated Leak Rate Test (ILRT) at the end of the 1983 refueling outage in fulfillment of Technical Specification 4.6.1.2.

Millstone Unit No. 2 Technical Specification 4.6.1.2 states that an ILRT will be performed at 40±10 month intervals during shutdown. Our last ILRT was performed in April, 1979. Given a 50 month time frame, this allows operation in accordance with surveillance requirements until June, 1983. This date falls within the scheduled refueling period of April 15, 1983 to August 19, 1983. From a scheduling perspective, Integrated Leak Rate Testing is performed optimally at the end of the refueling outage, just prior to startup. Thus, we may exceed the 40±10 month interval for Technical Specification 4.6.1.2.

NNECO trusts you will find this schedule acceptable based on our efforts to optimize resource expenditures during the upcoming refueling outage and will proceed with scheduling the ILRT at Millstone Unit No. 2 for the end of the 1983 refueling outage unless contacted to the contrary.

Very truly yours,

NORTHEAST NUCLEAR ENERGY COMPANY

W. G. Council
