APPLICANT'S PROPOSED FINDINGS OF FACT  
AND CONCLUSIONS OF LAW IN THE FORM  
OF A PARTIAL INITIAL DECISION

Philadelphia Electric Company, Applicant in the captioned proceeding, in accordance with 10 C.F.R. §2.754 and the Atomic Safety and Licensing Board's Order of July 13, 1982, hereby submits the attached proposed findings of fact and conclusions of law in the form of a partial initial decision with respect to those contentions for which the hearing has been completed.

Pursuant to the instructions of the Licensing Board (Tr. 3892), Applicant has prepared its submission utilizing the format followed in the Susquehanna Initial Decision, dated April 12, 1982 and in accordance with the specific instructions outlined by the Board (Tr. 3892 et seq.).

Respectfully submitted,

CONNER & WETTERHAHN, P.C.

APPEARANCES

TROY B. CONNER, JR., Esq., MARK J. WETTERHAHN, Esq., ROBERT M. RADER, Esq., and INGRID M. OLSON, Esq., of Conner & Wetterhahn, P.C., Washington, D.C. for Philadelphia Electric Company.

JOSEPH RUTBERG, Esq., ANN P. HODGDON, Esq. and ELAINE I. CHAN, Esq., Office of the Executive Legal Director, U.S. Nuclear Regulatory Commission, Washington, D.C. for the NRC Staff.

ROBERT J. SUGARMAN, Esq., for Del-Aware Unlimited, Inc.

PARTIAL INITIAL DECISION  
(OPERATING LICENSE PROCEEDING)

OPINION

I. BACKGROUND

This partial initial decision concerns the application filed with the Nuclear Regulatory Commission (hereinafter "Commission" or "NRC") by the Philadelphia Electric Company (hereinafter "Applicant") for facility operating licenses which would authorize the operation of the Limerick Generating Station, Units 1 and 2 (hereinafter "Limerick" or "facility"). Applicant is responsible for operation of the facility, which utilizes two boiling water nuclear reactors, each designed to operate at a core power level of 3440 megawatts thermal, with an equivalent net electrical output of 1055 megawatts. The facility is located on the Applicant's site on the Schuylkill River, near Pottstown, in Limerick Township, Montgomery County, Pennsylvania.

The application for operating licenses was filed by Applicant on March 17, 1981 and docketed by the NRC on July 27, 1981. <sup>1/</sup> On August 21, 1981, the Commission published "Notice of Receipt of Application for Facility Operating Licenses; Notice of Consideration of Issuance of Facility Operating Licenses; Notice of Availability of Applicant's

---

1/ The application consists of its formal portion, the Final Safety Analysis Report ("hereinafter "FSAR") and the Environmental Report-Operating License Stage (hereinafter "EROL") and amendments thereto.

Environmental Report; and Notice of Opportunity for Hearing." <sup>2/</sup>

On September 8, 1981 this Atomic Safety and Licensing Board (hereinafter "Licensing Board" or "Board") was established to rule on the petitions and the requests for participation as interested governmental agencies. <sup>3/</sup>

Following a special prehearing conference held on January 6-8, 1982 to consider the petitions and requests, the Licensing Board issued a Special Prehearing Conference Order (hereinafter "SPCO") on June 1, 1982. As regards the instant decision, the only petitioner raising relevant contentions was Del-Aware Unlimited, Inc. (hereinafter "Del-Aware"), which the Board admitted as an intervenor.

The three admitted contentions litigated by Del-Aware and decided herein raise environmental issues pertaining to the supply of supplemental cooling water by way of the Point Pleasant diversion, which will furnish water to Limerick by way of an intake structure and pumping station located on the Delaware River in Point Pleasant, Pennsylvania. <sup>4/</sup> As described in greater detail below, this system will convey

---

<sup>2/</sup> 46 Fed. Reg. 42557 (August 21, 1981).

<sup>3/</sup> Establishment of Atomic Safety and Licensing Board to Preside in Proceeding, 46 Fed. Reg. 45715 (September 14, 1981).

<sup>4/</sup> Inasmuch as Del-Aware was the only intervenor to pursue these three particular contentions, the Board shall refer to the Applicant, the Staff and Del-Aware hereinafter as "the parties."

water to the Bradshaw Reservoir, which will then be pumped to the Limerick facility via the East Branch of the Perkiomen Creek.

The project includes various components, some of which will be operated solely by Applicant and others which will be utilized only by the Neshaminy Water Resources Authority (hereinafter "NWRA") to furnish water to Montgomery and Bucks Counties. The intake structure and pumping station will be operated by NWRA. For convenience, the Board will refer only to "Applicant" in describing the joint usage of this facility by both entities.

The hearing on the two remaining contentions was commenced in Norristown, Pennsylvania on October 4-8 1982 and completed in Bethesda, Maryland on October 18-26, 1982. <sup>5/</sup> At the hearing, the parties agreed to a stipulation, which the Board approved, withdrawing one of the three contentions (Contention V-16b), which related to alleged groundwater contamination and hydraulic saturation (Tr. 2371).

---

<sup>5/</sup> In its SPCO, the Licensing Board stated its intent to consider these contentions on an accelerated basis in order to decide them prior to the scheduled construction of the Point Pleasant intake structure and pumping station and the Bradshaw Reservoir as authorized by the Delaware River Basin Commission (hereinafter "DRBC") in DRBC Docket Nos. D-79-52 CP and D-65-76 CP(8), both issued on February 18, 1981. SPCO at 88-89. Accordingly, the Board adopted a schedule for the resolution of supplemental cooling water contentions prior to the scheduled commencement of construction at Point Pleasant on or about December 15, 1982.

The decisional record in this proceeding consists of the following:

- a. The Commission's Notice of Hearing;
- b. The pertinent pleadings filed herein, including the petitions and other pleadings filed by the parties, and the orders issued by the Licensing Board during the course of this proceeding;
- c. The transcripts of the special prehearing conference on January 6-8, 1982 (Tr. 1 to 737), and the transcript of testimony of the evidentiary hearings (Tr. 738 to 4038);
- d. All of the exhibits marked for identification, whether received into evidence, are listed in Appendix A to this partial initial decision.

This Board's jurisdiction is limited to a determination of findings of fact and conclusions of law on matters put into controversy by the parties to the proceeding or found by the Board to involve a serious safety, environmental or common defense and security question. <sup>6/</sup> The Board has made no such additional determinations in this case.

## II. CONTENTIONS

### Legal Background

The Point Pleasant project has been the subject of ongoing review by a number of concerned agencies. For

---

<sup>6/</sup> See 10 C.F.R. 2.760(a); 10 C.F.R. Part 2, Appendix A, Section VIII(b).

several years, proceedings on the project were conducted before the Delaware River Basin Commission ("DRBC") which, as noted below, granted final approvals to NWRA and to PECO for their respective components of the project on February 18, 1981. <sup>6/</sup> The DRBC docket decisions issued at that time authorized construction of the project and incorporate earlier decisions which set the terms and conditions for the allocation of Delaware River water to be withdrawn at Point Pleasant.

Separate permit activities were conducted by NWRA before the United States Army Corps of Engineers, which on October 25, 1982 issued dredge and fill permits to NWRA pursuant to Section 10 of the Rivers and Harbors Appropriations Act of 1899, 33 U.S.C. §403 and Section 404 of the Clean Water Act, 33 U.S.C. §1344. Such permits are necessary for construction of the intake structure for the Point Pleasant pumping station in the Delaware River. <sup>7/</sup>

Each of these respective agencies determined that environmental impacts associated with the project were minimal and, in the context of the undertaking, insignificant. Each agency issued an environmental

---

7/ On September 2, 1982, stream crossing and encroachment permits were issued to Applicant by the Pennsylvania Department of Environmental Resources ("PaDER"), as well as to NWRA.

assessment in which the agency's findings and conclusions were explained in detail. <sup>8/</sup>

Throughout the proceedings, the Applicant has taken the position that the review by DRBC pursuant to its statutory authority under its Compact precludes the NRC from reevaluating de novo environmental impacts associated with the operation of the pumping station as to Applicant and NWRA. It takes the position that the NRC has no jurisdiction over NWRA. Applicant also contends that the recently completed review by the Corps of Engineers in issuing dredge and fill permits precludes the NRC from altering the intake structure design or location. <sup>9/</sup> In Applicant's view, the NRC is precluded from considering anew potential environmental impacts as to which the DRBC and Corps of Engineers have made conclusive findings by (1) "lead agency" concept under the National Environmental Policy Act ("NEPA") of 1969, 42 U.S.C. §4321, et seq.; (2) the NRC Second Memorandum of Understanding, Federal Water Pollution Control Act, <sup>10/</sup> and (3) the decision at the

9/ These matters were reviewed by the Corps of Engineers and discussed in its Environmental Assessment issued in conjunction with the permits. The Board takes official notice of the Environmental Assessment prepared by DRBC, PaDER and the Corps of Engineers.

10/ 40 Fed. Reg. 60115 (December 31, 1975).

construction permit stage on the utilization of environmental findings by other agencies. <sup>11/</sup> Nonetheless, the Licensing Board has conducted a full evidentiary hearing on the two contentions involving the Point Pleasant project and has determined, for the reasons discussed in detail below, that construction of the project may proceed, regardless of what weight is given to the findings of other agencies.

1. Impacts Upon Fish Resources and Recreational Activities (Contention V-15 and V-16a in part).

Intervenor Del-Aware contends that the Point Pleasant intake will be relocated in the Delaware River so as to cause significant adverse impacts on fish in the area, particularly American shad and shortnose sturgeon. Del-Aware also claims that the intake structure will cause drawdown of the pool formed by the wing dam at Lumberville approximately one mile downriver, which will adversely affect boating and recreation in the area. A great number of subsidiary issues were raised at the hearing. Although the Board has decided all relevant issues in making particularized findings of fact, it has attempted to discuss in this opinion only the more vigorously contested matters.

The Board considered the location of the intake structure as now proposed, the design and configuration of the intake structure, flow characteristics of the Delaware

---

11/ Limerick, ALAB-262, 1 NRC 163 (1975).

River at this location and the physical and behavioral characteristics of shortnose sturgeon likely to be present in the intake structure area at all stages of their development.

Location of the Intake and  
Flow Characteristics of the  
Delaware River at Point Pleasant

Although a shoreline location utilizing vertical traveling screens was initially planned, it was later decided to use cylindrical wedge wire screens located in the river in order to maximize environmental protection for aquatic life. The finally selected location at Station 8+62 (approximately 245 feet from the shoreline) was selected over alternative locations in the river in order to minimize any adverse impact on aquatic life in the Delaware River. Both the Applicant's and Staff's witnesses, as well as the expert on shortnose sturgeon subpoenaed by Del-Aware, agreed that the selected location provides optimal protection of aquatic life in the area and that deployment of the intake further into the channel would yield no greater protection. (Board Findings 11-13, 114-21, 123).

Measurements of velocity were taken by Applicant at the location of the intake at flows of 3,000 cfs and 4,500 cfs. These measurements show that even at a low flow of 3,000 cfs, the velocity at the intake site will be 1 fps or greater. Applicant was able, by extrapolation from these values to show that even under the minimum low flow of 2,500 cfs anticipated under the most severe circumstances, bypass

velocity at the intake would be .8 fps. (Board Findings 36-51).

Del-Aware attempted to discredit Applicant's measurements and calculations. Del-Aware suggested that the locations where Applicant's measurements were taken were inaccurate. Applicant, however, was able to show that its depiction of station locations in the river was reasonably accurate. The Staff and even Del-Aware's own witness agreed to the accuracy of these locations. Further, the Applicant's evidence establishes that the instruments used to take the velocity measurements produced accurate results. Del-Aware's witness conceded that the measurements of the speed of the current were accurate within 5 percent. The Staff made independent calculations and agreed that Applicant's data were reasonably accurate. (Board Findings 36-41).

Applicant correlated elevations at Point Pleasant to flow levels on a rating curve. The curve shows measured elevations at flows as low as 2,700 cfs. From these measurements, Applicant extrapolated the values at lower levels of flow. Del-Aware attempted to discredit Applicant's data, asserting that the values on the rating curve at lower levels failed to take into account the hydraulic control of the downstream Lumberville wing dam. Applicant, however, was able to show that the effect of the dam on the extrapolated values was minimal and had in fact been considered. Thus, the Board finds that the Applicant's

data for flows and elevation are accurate. (Board Findings 37-39).

Del-Aware contended that Applicant's determination of the flow at Point Pleasant failed to consider the diversion via the Delaware-Raritan Canal. The Board finds that the probable discrepancy is approximately 100 cfs, which the Board finds is insignificant and does not substantially affect Applicant's velocity measurements at Point Pleasant and derived values. (Board Findings 49-51).

The flow characteristics of the Delaware River at Point Pleasant are significant in this proceeding to analyze potential impacts of the intake on the American shad and shortnose sturgeon. Specifically, one issue raised was whether the ratio of the river flow velocity past the intake to the intake velocity is sufficient to protect American shad and shortnose sturgeon from entrainment or impingement by the intake.

Basically, the evidence establishes that a ratio of 2:1 or greater will exist between the bypass velocity of the river as it flows past the intake as compared to the maximum intake velocity during periods in which the Delaware River flow will constitute 3,000 cfs or greater, which constitutes the conditions which will exist for 90 percent of the time the intake is in operation. Although a 2:1 or better ratio provides optimal protection to aquatic life which may be affected by the intake's operation, minor fluctuations below that ratio will make no discernible difference. Even a 1:1

ratio will assure adequate protection to aquatic life. In fact, wedge wire screens provide substantial protection from impingement and entrainment even where utilized in still water. From the evidence considered by the Board, the 2:1 or better ratio, even with minor variations, will adequately protect aquatic life. (Board Findings 34-36, 44-48, 52-58, 71-72, 114-121).

For its part, Del-Aware was unable to establish that greater flow velocities existed further into the channel, or that greater bypass velocities than those anticipated at the present location of the intake would provide any further protection to aquatic life in the area, specifically American shad and shortnose sturgeon. The Board is not persuaded by the apparent "more is better" philosophy which dominated the opinions of Del-Aware's witnesses. (Board Findings 117-120).

Del-Aware also asserted that cross currents created by a bar upstream from the intake which might affect the efficiency of the wedge wire screens had not been considered by Applicant. Del-Aware's witness could not support a proposition that a cross current would pass the screens at a 30° vector. The Del-Aware witness merely speculated that a current created by the bar could meet the intake at an angle of 5° to 25°. The Board is persuaded by the Applicant and Staff answers to cross-examination and Board questions that even a cross current at an angle of 30° would not adversely affect the effectiveness of the wedge wire screens in

minimizing impingement and entrainment. (Board Findings 65-66).

Del-Aware also attempted to establish that during periods of low flow, the eddy would expand such that its waters would be drawn into the intake. Del-Aware contended that this would have an adverse impact upon shad. However, the Board concluded that the evidence proffered by the Applicant and Staff demonstrates that the eddy's water will not reach the intake structure in the Delaware River channel, even during periods of low flow. Del-Aware's witness conceded that the main channel flow will push the eddy toward the shore and was unable to predict whether any of the eddy's water would be drawn in by the intake. Assuming that the eddy did not reach the intake, shad in the eddy would not be affected. Accordingly, Del-Aware failed to show that any adverse impact upon shad would result from the alleged drawing of water from the eddy. (Board Findings 14-16, 59-64).

Finally, Del-Aware purported to show that the rate of impingement or entrainment of eggs on the wedge wire screens would be higher than Applicant's predicted rate at Point Pleasant. However, the study relied upon by Del-Aware involved striped bass, whose eggs are smaller than those of fish within the scope of its contention. Further, the data cited by Del-Aware were obtained from laboratory studies in which conditions were created to maximize adverse environmental consequences, e.g. concentrated amounts of

eggs were introduced by means of a flow which was recirculated in the flume as much as 20 times. These studies were therefore not intended to yield meaningful data for circumstances at Point Pleasant. (Board Finding 103).

Design and Configuration  
of the Intake Structure

The Point Pleasant intake structure will utilize passive wedge wire screens, which constitute the state-of-the-art technology. Given their particular design, the wedge wire screens provide a substantial improvement in reducing impact on aquatic life over the conventional shoreline, traveling screens generally utilized. Further, this particular design is less susceptible to clogging and can be easily replaced or repaired. The Board concludes that the use of wedge wire screens on the intake will afford the greatest possible protection to aquatic life. (Board Findings 17-33, 56-58, 67-68, 71-76, 121).

Del-Aware contended that the slot orientation for the wedge wire screens might not provide optimal protection for aquatic life if changes in current direction occurred. The evidence, nonetheless, showed that such variances would not materially reduce the protection afforded by the wedge wire screens. (Board Findings 67-68).

Effect on Fish in General

The evidence demonstrated that at a flow of 3,000 cfs, the DRBC specified low flow value and the lowest rate of flow at which withdrawals at Point Pleasant will be permitted absent

upstream compensation, only a maximum of 5 percent of the fish eggs and larvae in the river flow would be susceptible to entrainment, assuming uniform distribution of these life stages in the withdrawn flow. Only a relatively small percentage of potentially affected larval fish would be impinged, most of which would escape from the wedge wire screen. Given the anticipated ratio between bypass and intake velocities, only a very small percentage of fish are likely to be impinged on the wedge wire screens. Further, fish generally react to physical contact with a burst swimming response. Contact with the wedge wire screens will therefore cause most fish to swim away. (Board Findings 52-58, 69-75).

Much of the testimony relating to aquatic impacts proffered by Del-Aware related to the characteristics of fishes other than American shad and shortnose sturgeon. The Board has accepted this evidence, e.g., the existence of a "pollution block" created by low levels of dissolved oxygen in the river, within the record for background purposes in understanding the general nature of the Point Pleasant vicinity as a recreational resource for fishing. (Tr. 780). However, the Board has made no findings with regard to possible impacts of the intake's operation upon other fishes since Del-Aware's contention encompasses only these two particular species.

American Shad

The Board found no evidence that shad spawn in the Delaware River at Point Pleasant, although the area is a

suitable spawning habitat. Juvenile shad do utilize Point Pleasant as a nursery area. Even if shad did spawn at Point Pleasant, the characteristics of shad eggs make it unlikely that they would be entrained by the intake. Most shad eggs are larger than the 2 mm. wedge wire screen slot. Moreover, shad eggs in a free river environment suffer a mortality rate on the order of 99.99 percent. The survivors are those which generally find appropriate lodging in interstices among the rocks on the bottom immediately after spawning. Accordingly, any eggs which might be entrained by the intake would be those more likely not to have otherwise survived. The larval stage for shad is relatively brief, and other members of the shad genus have shown behavior resistance to entrainment and impingement by wedge wire screens. Juvenile and adult shad have sufficient strength and swimming speed to avoid impingement on the wedge wire screens. (Board Findings 77-93, 103, 121).

It is contended by Del-Aware that insufficient consideration had been given to the possibility that shad spawn in the pool area which, as noted, is problematical. The intake's design assumes conservatively that shad may spawn at Point Pleasant. Also, if spawning occurs in the pool, the Board concludes that shad eggs, which are demersal and sink to the bottom soon after spawning, will not be drawn up into the water column. On the other hand, any shad eggs (only a small fraction of which survive) which are impinged against the intake screens or entrained are

unlikely to have been productive in any event. (Board Findings 82-87).

Del-Aware's witnesses conceded that their main concern was that young shad present in the eddy might be impinged or entrained by the intake. They stated that they would be "satisfied" if it could be shown that the eddy would not reach the intake. As discussed above, the Board has concluded that the eddy lies beyond the area of the intake's withdrawal, even at periods of low flow. (Board Findings 59-63, 120).

Shortnose Sturgeon

The Board has received no evidence that the shortnose sturgeon, which is on the Secretary of the Interior's list of endangered species, is present at Point Pleasant. The documented capture of shortnose sturgeon nearest the Point Pleasant vicinity occurred at Lambertville, New Jersey, eight miles downstream of Point Pleasant. A sampling program specifically designed to determine the presence of shortnose sturgeon in the Point Pleasant intake vicinity during the time of the year when construction would occur, conducted in 1981, yielded no shortnose sturgeon. Other upstream sampling programs have also produced no shortnose sturgeon. While Del-Aware challenged the validity of the sampling programs, it offered no evidence showing the presence of shortnose sturgeon in the area. (Board Findings 94-97).

Even if sturgeon were present in the vicinity, they would not be affected by the intake structure. Shortnose

sturgeon eggs are approximately 3.2 mm. and thus too large to pass through the 2 mm. slots. The witnesses agreed that it is very difficult to collect shortnose sturgeon eggs, larvae and adults due to their very strong association with the river bottom. This indicates a low likelihood that shortnose sturgeon at any life stage would be entrained or impinged by the intake, which is located more than two feet above the river bottom. Even relatively young larvae are able to outswim the intake velocity, thereby essentially eliminating the possibility of impingement. The National Marine Fisheries Service, which has jurisdiction over the shortnose sturgeon under the Endangered Species Act, 16 U.S.C. §1536, to provide formal opinions to federal agencies, has determined that the Point Pleasant project will cause no adverse impact upon the shortnose sturgeon. (Board Findings 98-113, 121).

Drawdown and Recreation Resources

The testimony of Del-Aware's witnesses regarding recreational impacts conflicted with their testimony regarding impacts on aquatic life. Basically, Del-Aware asserted that moving the intake further into the river channel would reduce potential aquatic impacts, but also contended that relocating the intake at the shoreline would be less likely to interfere with fishing in or along the Pennsylvania side of the river. Del-Aware's witnesses conceded that the recreational concerns were subordinate. Nonetheless, the Board is unpersuaded that the presence of

the intake in the river channel would, as those witnesses speculated, tend to divert fish migrating upstream past the intake toward the New Jersey shore. (Board Findings 122-23, 130).

The Board received uncontroverted testimony that the drawdown of the immediate river area at Point Pleasant, conservatively estimated, would be no more than 3/4 inch if all four pumps were started at the same time at the 3,000 cfs flow level. The Board believes that this minor fluctuation in water level is insignificant to aquatic life and would be overshadowed by other fluctuations unrelated to pumping operations. No difference in surface water current or other effects could be anticipated from such minor fluctuations. (Board Findings 124-27, 130).

Boating and other recreational activities would also be unaffected. Inasmuch as the intake structure will be covered by a minimum of four feet of water, the intake will not be a hazard to boaters, rafters or water skiers. The Board is unpersuaded by the data submitted by Del-Aware that river elevation would, under any flow conditions, change drastically enough to reduce significantly the four foot water buffer. (Board Findings 128-30).

#### Conclusion

Having considered all of the evidence, the Board concludes that the location of the intake structure and the use of passive wedge wire screens will provide optimal protection for fishes in the area, given the flow

characteristics of the Delaware River at Point Pleasant as well as the behavioral and physical characteristics of fishes at Point Pleasant. The Board finds that any potential environmental impacts upon such aquatic life have been eliminated or mitigated to the fullest extent reasonably possible. (Board Findings 1-130).

2. Potential Noise and Dredging Maintenance Impacts  
(Contention V-16a).

In this contention, Del-Aware asserted that noise and dredging maintenance connected with the operation of the intake structure and pump station would adversely affect the peace and tranquility of the Point Pleasant proposed historic district. Evidence was submitted by Del-Aware with regard to the cultural characteristics of the Point Pleasant area. The Board itself toured the site during the hearings in order to assist it in evaluating testimony as to the surrounding environs. The Board was therefore able to rely upon its own observations in determining what is essentially an issue of aesthetics. (Board Finding 132).

Noise Levels

A site noise survey conducted in 1981 determined that ambient daytime noise levels were not significantly different from nighttime levels. The equivalent A-weighted sound levels ranged from 46 dB to 53 dB. This provided a basis for comparing noise from the operation of the pumphouse with ambient levels at the site boundary. (Board Findings 133-34).

The pumphouse will contain four pumps, located approximately 50 feet below the floor of the pumphouse driven by electrical motors, which will have a maximum A-weighted sound rating of 86 dB at one meter. The Board determined that, because the concrete walls of the pumphouse will attenuate 50 to 60 dB, very little noise will emanate outside. Additional sound attenuating features, e.g., acoustical lining on main ventilating and air conditioning ducts, will be utilized to reduce even further the noise level outside the pumphouse. Thus, noise generated by the operation of equipment within the pumphouse will not increase ambient noise levels beyond the site. (Board Findings 135-46).

The Board also found that the noise levels from equipment outside the pumphouse would be relatively insignificant. Two low noise level transformers with an A-weighted sound level rating of 57 dB will be installed outside the pumphouse. The noise from the transformers at the site boundary will be approximately 36 to 38 dB, which may or may not be audible. If it appears that there would be an increase in the ambient noise level at the boundary in the direction of nearby residences, the Applicant is committed to construct sound wall barriers so as not to increase the ambient noise level in the direction of such residences. The Board has incorporated this commitment as a condition in this decision. While Del-Aware attempted to discredit the data and calculations proffered by the

Applicant and Staff, its cross-examination did not refute their accuracy. Nor did Del-Aware present any affirmative evidence which materially contradicted such data. (Board Findings 147-57).

Dredging Maintenance

Under present plans, the river bottom upon which the intake structure has been built will be returned to its natural contours, such that no maintenance dredging is anticipated once the construction of the intake is complete.

River borings show little change in the bottom grade at the intake site since an initial survey 14 years ago. Further, flow velocities in the river channel where the intake structure will be located are sufficiently strong to keep the river bottom clean. Finally, the channel bottom area under the intake will be covered with riprap to prevent erosion. The Board finds that these circumstances render maintenance dredging very unlikely. Del-Aware presented no evidence showing that such dredging would be required. (Board Findings 158-61, 177).

The Board also considered whether other maintenance would be required for the intake structure. If any debris flows down the river, it will likely come during periods of floods or high flows. Because the elevation of the river at these times will be higher, it is unlikely that the intake would be damaged by debris. During periods of flood, flows are generally over 90,000 cfs. and the intake will be submerged by over 19 feet. Further, the intake will be

protected by 12-inch steel guard posts which will deflect any debris passing by the intake. In the unlikely event that debris collects around the intake, it could be cleared away by divers from a boat. If damage were to occur to the intake screens, they would likely be repaired by divers. Such infrequent and hardly noticeable activity, if it did occur, would not significantly disturb the peace and tranquility of the Point Pleasant community. (Tr. 162-67).

It is anticipated that the intake structure will be used only minimally during winter months when frazil ice might occur. Thus, it is not expected that frazil ice clogging of the intake will necessitate any maintenance. However, the intake will be equipped with an air backwash system, which should effectively eliminate any frazil ice if clogging does occur. (Board Findings 168-77).

Del-Aware attempted to establish by photographic evidence that ice floes and frozen debris in the Delaware River could damage the intake structure. The Board found these photographs and related testimony to be inconclusive, chiefly because they did not establish the depth of any such floes or any particular potential for inflicting subsurface damage. There was no evidence that the steel guard posts would not withstand and deflect any ice or debris that might strike them. (Board Findings 165, 174).

#### Conclusions

The Board has considered all of the data concerning the predicted noise levels associated with the operation of the

intake structure and pump station as well as the likelihood of any dredging and/or maintenance activities. The Board has concluded that ambient noise levels beyond the site area will not be increased and, if necessary, can be further mitigated by the provision of sound attenuating structures. The Board is also of the view that dredging and repairs for the intake structure are not likely to be required. If any such activities are necessary, however, they will be isolated and nonintrusive in nature without any significant esthetic impact upon the Point Pleasant area. (Board Findings 131-177).

#### FINDINGS OF FACT

#### III. CONTENTIONS

##### Background

1. The Point Pleasant project is comprised of a number of components whose purpose and function is to supply supplemental cooling water for the Limerick facility and provide water to both Montgomery and Bucks County as stated by the Delaware River Basin Commission in its Final Environmental Assessment on the Neshaminy Water Supply System (August 1980). The diversion also serves the incidental function of augmenting low stream flows in both the East Branch Perkiomen and North Branch Neshaminy Creek, by which the diverted water is carried for its respective uses. (Final Environmental Assessment on the Neshaminy Water Supply System at II-1 (August 1980) ("DRBC FEA")).

2. Neshaminy Water Resources Authority ("NWRA") will construct and operate the Point Pleasant pumping station (including the intake structure), and the combined transmission main. Applicant will construct and operate the Bradshaw Reservoir. 12/ (DRBC Negative Declaration, Attachment at 1 (August 25, 1980)).

3. Applicant is a customer of NWRA for water for Limerick, for which NWRA pays a charge in accordance with the provisions of DRBC Resolution No. 74-6, as amended. (DRBC Docket No. D-65-76 CP(8) at p. 13 (February 18, 1982); DRBC Docket No. 79-52 CP at p. 3 (February 18, 1981)).

4. The pumping station will draw water from the Delaware River by means of an intake structure set into the Delaware River channel approximately 245 feet from the shore and approximately 800 feet below the of the Tohickon Creek and the Delaware River at river mile 157.2 (Applicant's Testimony at 3; Masnik Testimony at 4).

5. The pumping station will have a withdrawal capacity of 95 million gallons per day ("mgd") as allowed by DRBC in its docket decisions. 46 mgd of this is allocated by the DRBC to the Limerick facility as supplemental cooling water. (DRBC Docket No. 79-52 CP at p. 3 (February 18, 1981)).

6. The combined transmission main, which will convey the water withdrawn from the Delaware River by the pumping

---

12/ The matters discussed herein pertain to both Applicant's and NWRA's use of the pumping station and Bradshaw Reservoir, unless otherwise stated.

station, will run from the station underground for approximately 2.5 miles and will connect with the Bradshaw Reservoir, which has a 70 million gallon capacity, and the North Branch Transmission Main. (Applicant's Testimony at 17, 19).

7. The Bradshaw Reservoir is a relatively small reservoir designed to permit distribution of water to supply the Limerick facility with cooling water sufficient for one day's operation in order to compensate short-term fluctuations in water supply. It will also serve to supply water to NWRA. Its water is not required for the safe shutdown of the Limerick reactors. (Applicant's Testimony at 17-19; DRBC Docket No. 79-52 CP at p. 3 (February 18, 1981)).

8. The contentions pertinent to this partial initial decision relate wholly to operation of the Point Pleasant pumping station and intake structure. The only admitted contention relating to the Bradshaw Reservoir was withdrawn by Del-Aware. Withdrawn Contention V-16b, which related to alleged seepage of toxics from the Bradshaw Reservoir, was abandoned by Del-Aware when its engineering witness determined that there was no basis upon which to predict that such seepage would occur. (Tr. 2371).

9. The remaining components of the system which will convey supplemental cooling water for Limerick are not at issue and will be reviewed by the Staff in the course of its

environmental review and preparation of an FES for Limerick. Much of this review was completed at the construction permit stage. In accordance with 10 C.F.R. §50.23(e), the draft and final environmental impact statements for Limerick will therefore focus upon any changes which have occurred since that time.

Impacts of the Intake on American  
Shad, Shortnose Sturgeon, the Fish  
Resources and Boating and Recreation

10. Contentions V-15 and V-16a (in part), as litigated in this proceeding reads as follows:

Contentions V-15 and V-16a (in part) -  
The intake will be relocated such that it will have significant adverse impact on American shad and short-nosed sturgeon. The relocation will adversely affect a major fish resource and boating and recreation area due to draw-down of the pool.

11. The intake in the Delaware River for the Point Pleasant Pumping Station has not been "relocated" within the context of this contention. Various locations for the intake have been considered (Applicant's Testimony at 2, Harmon, Tr. 2406; Bourquard, Tr. 2586).

12. In order to minimize any adverse impact on the stream biota, the intake was changed from a shoreline vertical traveling screen structure to a passive wedge wire screen structure located out in the river channel about 200 feet from the west shore line in the application by NWRA to the U.S. Army Corps of Engineers filed on July 18, 1980 (Applicant's Testimony at 2-3; Harmon, Tr. 2406-07, 2578-79; Applicant's Exh. 2 at p. 1; Del-Aware Exh. 1-C).

13. To assure higher river flow velocities past the intake screens, the intake was later moved an additional 45 feet further out into the river channel to Station 8+62 which is the site to be utilized for construction of the intake facility (Applicant's Testimony at 3; Applicant's Exh. 2 at p. 2; Bourquard, Tr. 2213, 2586, 2661-62).

14. The intake has been described as being located in the "pool" formed by the Lumberville wing dam. For the purposes of Applicant's biological evaluation, the pool extends upriver from the Lumberville wing dam to the riffle or rapids near the mouth of Tohickon Creek. (Applicant's Testimony at 6; Boyer, Tr. 2412-13; Harmon, Tr. 2413).

15. An eddy is a circular current of water, one part of which runs contrary to the main current. There is an eddy inshore of the Point Pleasant intake. (Applicant's Testimony at 6; Harmon, Tr. 1405-06; Boyer, Tr. 1403; Bourquard, Tr. 2524; Brundage, Tr. 2952).

16. The intake is located near the upstream limits of the Lumberville pool. It is in the main current, it is not in a slackwater or eddy area (Applicant's Testimony at 6; Applicant's Exh. 2 at p. 1; Harmon, Tr. 2361-62, 2573; Bourquard, Tr. 2574; Brundage, Tr. 2973; Boyer, Tr. 2766; Plevyak, Tr. 1941).

17. The intake at Point Pleasant will use passive wedge wire screens which are the state of the art technology (Applicant's Testimony at 3; Boyer, Tr. 1350).

18. Until fairly recently, comparable intake structures used vertical traveling screens located on the shoreline, and this type of screen design was initially selected. These screen systems, even with low velocity of water travel through the screens, still had certain minimal but inherent, biological drawbacks (Applicant's Testimony at 3).

19. To address such concerns, the wedge wire screen technology was adopted. The wedge wire screen design to be used at Point Pleasant will effect a substantial reduction in losses of aquatic life at the intake when compared to a conventional traveling screen intake design (Applicant's Testimony at 3).

20. The greater protection of aquatic life afforded by the wedge wire screen derives from its hydrodynamic characteristics which in turn result from its shape and construction. (Applicant's Testimony at 3).

21. Del-Aware's ichthyological witnesses testified as to studies of impingement at other facilities which, however, did not utilize wedge wire screens. The witnesses agreed that less impingement would be expected for wedge wire screens. (Emery, Tr. 2058-59, 2071).

22. Six 40-inch diameter by 10 feet 4 inch cylindrical screen sections will be placed end-to-end, which, with intermediate spacing, results in a total row length of about 75 feet (Applicant's Testimony at 3; Masnik Testimony at 4).

23. Two parallel rows will be installed in the river with the long axis oriented parallel to the flow of the river. The two rows will have a clear space between them of more than 7 feet. (Applicant's Testimony at 4; Masnik Testimony at 4).

24. The top side of the screen surface will be a minimum of 4 feet below the minimum water level, and the bottom screen surface will be slightly more than 2 feet above the existing river bed. (Applicant's Testimony at 4; Masnik Testimony at 5).

25. The 360 degree clearance around all screens will permit the unrestricted flow of water into the screens throughout their entire circumference and the flow of the river will pass along the screens thus helping to keep the screens clean of debris and silt. (Applicant's Testimony at 4; Masnik Testimony at 5).

26. Each screen section will resemble a "T" with screening at each end and the combination support/outlet pipe in the middle. (Applicant's Testimony at 4).

27. The screens will be made by helically winding a stainless steel wire with a wedge shaped profile around a cylindrical frame. (Applicant's Testimony at 4; Masnik Testimony at 4).

28. The point of the wedge wire will face inward so that the exterior screen surface will be smooth and flat. (Applicant's Testimony at 4).

29. The screen openings will be 2 mm. wide.  
(Applicant's Testimony at 4; Masnik Testimony at 4-5).

30. Biofouling of the screens will not occur inasmuch as the type of organisms that cause biofouling are not present at the Point Pleasant location. (Harmon, Tr. 2586).

31. The design and positioning of wedge wire screens make them less susceptible to clogging. (Emery, Tr. 1770).

32. The intakes will be equipped with an air backwashing system to clean the screens. (Applicant's Testimony at 4).

33. If debris accumulates on the screens, they will be cleaned by using the air backwash system. (Boyer, Tr. 2558-59, 2561; Bourquard, Tr. 2557-61). In the event of significant debris, the screens will be cleared by divers. (Bourquard, Tr. 2428; Boyer, Tr. 2540).

34. The maximum intake velocity through the screens is .5 fps, with an average velocity of .35 fps. (Applicant's Testimony at 5; Applicant's Exh. 2 at p. 1; Boyer, Tr. 1351; Emery, Tr. 1768, 1774).

35. The average intake velocity will decrease from about .071 fps at a distance of one foot from the screen surface to .011 fps at five feet from the screen and to .0037 fps at 10 feet from the screen (Applicant's Testimony at 5; Harmon, Tr. 2854-56, 2899; Dickinson, Tr. 2854-55; Boyer, Tr. 1363).

36. Measurements taken at the intake site (Station 8+62) on July 23, 1981 when the flow was 4,500 cfs and the

river elevation was 71.4 showed velocities of over 2 fps at the depths measured. With a low flow of 3,000 cfs and an elevation of 70.8 on July 23, 1981, velocity at the depth of the intake was over 1 fps. River velocities at the intake site will provide a 2:1 or greater ratio of bypass velocity to intake velocity. (Harmon, Tr. 2399; Boyer, Tr. 1350-51, 1385-93; Applicant's Exh. 1-A at p. 2 - Question E240.27).

37. The velocity measurements at the intake site are reasonably accurate. (Harmon, Tr. 2683). Del-Aware's witness agreed that the measurement of the speed of the current is accurate within 5 percent. (Phillips, Tr. 3826). An inconsistency in determining the location of the shoreline did not affect the accuracy of the velocity measurements in the vicinity of Station 8+62. (Boyer, Tr. 2203, 2638-43, 2651; Bourquard, Tr. 2193, 2747; Wescott Testimony at 4; Wescott, Tr. 3599-3600).

38. The methods used by Applicant in determining distance locations in the river where the flow velocity measurements were taken produced reasonably accurate results. (Harmon, Tr. 2184-87, 2648-49; Boyer, Tr. 2186; Bourquard, Tr. 2648-49; Wescott, Tr. 3600). Even Del-Aware's witness agreed that the stationing is accurate. (Phillippe, Tr. 3764).

39. Applicant developed a rating curve showing elevation correlated to river flows. This curve is reasonably accurate. The hydrologic effect of the Lumberville dam on the lower flow values is minimal and has

been taken into account by Applicant. (Boyer, Tr. 2593-98, 2616-17; Bourquard, Tr. 2272-73, 2282-84, 2593-98, 2600, 2676-78).

40. Flows at Point Pleasant may be calculated by taking 97 percent of the flow measured at the Trenton gage. (Bourquard, Tr. 2283, 2287-88; Phillippe, Tr. 3663).

41. For flows below 3,000 cfs, bypass velocity can be extrapolated from its own flow values, since flow and velocity are on the average proportional. (Boyer, Tr. 1358-60, 1368-69; Wescott, Tr. 3609).

42. At a flow of 2,500 cfs, the minimum bypass velocity will be approximately .8 fps. (Boyer, Tr. 1367, 1391-92; Wescott, Tr. 3610).

43. Even at a flow of 2,000 cfs, which is well below the minimum low flow of 2,500 cfs anticipated under the most severe circumstances, bypass velocity at the intake would be .6 fps. (Boyer, Tr. 1363).

44. Del-Aware's witness agreed that a flow of 3,000 cfs would result in a bypass velocity of at least 1 fps at the intake. (Emery, Tr. 1770).

45. Del-Aware's ichthyological witness conceded that the zone of influence of the intake velocity was approximately two inches. (Kaufmann, Tr. 1882).

46. At flows of 3,000 cfs or less, the maximum rate of pumping through the year 2010 as calculated will be 2/3 of the withdrawal permitted by DRBC. (Boyer, Tr. 1621; Bourquard, Tr. 1625).

47. Historically, flows at the Trenton gage have exceeded 2900 cfs 90 percent of the time for the period 1913 to 1980. During this period, many presently existing storage projects or reservoirs which can increase river flow were not in operation. Since the drought of the 1960's there has been an addition of approximately 135 billion gallons of storage on the Delaware River, i.e., an increase of 56 percent. (Boyer, Tr. 1362, 2575-77).

48. With the existing upstream storage on the Delaware, flows at Trenton can be regulated so that they will never fall below 2,500 cfs even with the advent of the most severe drought of record. (Hansler, Tr. 1261, 1275; Bourquard, Tr. 2332; Boyer, Tr. 2343-45, 2575-77).

49. The Delaware-Raritan Canal comes off the Delaware River below Point Pleasant and flows parallel to the river to a point above Trenton. (Boyer, Tr. 2833-34). The net diversion by this canal is presently limited by physical restrictions to 60 mgd or 90 cfs. The authorized maximum diversion from the basin is 100 mgd or 150 cfs. (Boyer, Tr. 2834).

50. The out of basin flow into the Delaware-Raritan Canal at the time relevant velocity measurements were taken was small and relatively constant. Additional water flowing into the canal is largely returned to the Delaware through overflow points at stream crossings and thus is included the flow at Trenton. (Boyer, Tr. 2835-36, 2858-63, 2869). The out of basin flow would not affect the flow values for the

respective velocity measurements at Point Pleasant. (Boyer, Tr. 2843-45).

51. Even if the flows into the Delaware-Raritan Canal would affect the flow values, the degree of error would be at most 100 cfs, an insignificant amount. (Boyer, Tr. 2869).

52. A 2:1 ratio of bypass velocity to intake velocity is fully adequate to protect against impingement and entrainment of fish. (Brundage, Tr. 2932; Boyer, Tr. 1351).

53. There is only a negligible difference between the protection afforded by a 2:1 ratio and a 1:1 ratio. (Harmon, Tr. 2853, 2399-2400). A 1:1 ratio affords a high level of protection for aquatic life. (Harmon, Tr. 2357-59, 2394-96, 2826, 2851; Boyer, Tr. 1351; Masnik, Tr. 4026).

54. If there were no bypass velocity at Point Pleasant, there would be no impact on American shad or shortnose sturgeon. (Harmon, Tr. 2827, 2846-47, 2850-54, 2898; Brundage, Tr. 2956).

55. The ratio of the bypass velocity to the intake velocity is only one of the factors which affords protection from impingement and entrainment on the screens to aquatic biota. (Harmon, Tr. 2519; Brundage, Tr. 2957).

56. Passive wedge wire screens have been shown to provide substantial protection from impingement and entrainment even when used in lakes where there is no bypass velocity. (Boyer, Tr. 1363; Harmon, Tr. 2582, 2855-56, 2886; Brundage, Tr. 2978).

57. Virtually all fishes will be completely protected from impingement on this type of intake. (Harmon, Tr. 2396).

58. Field studies in areas of varying flows from zero to over 1 fps indicate that bypass velocity does not make a detectable difference biologically. (Masnik, Tr. 4025-28).

59. In high flows the eddy, inshore of the Point Pleasant intake, is very close to the shore and, as flows increase, the eddy will recede to the shoreline and eventually may cease to exist as an eddy type of flow or slack water flow. In other words, the overlapping water at the rock bar at the mouth of Tohickon Creek will push the eddy back toward the shore. (Harmon, Tr. 1406, 1410; Boyer, Tr. 1417, 1427, 1431-32, 1678).

60. The width of the eddy does not expand greatly at lower flows and remains relatively constant. (Harmon, Tr. 1406; Boyer, Tr. 1404, 1417, 1432).

61. The rock bar at the mouth of the Tohickon Creek is not a factor in calculating the bypass velocity at the intake for low rates of flow. (Applicant's Exh. 1-A, Response to Question E240.27) provides velocity measurements at flow rates of 3,000 and 4,500 cfs. The full length of the bar is virtually uncovered when flows are approximately 4,500 cfs. Lower flows do not further uncover the bar significantly. In other words, at 4,500 cfs flows, there is only a small flow over the length of the bar. Accordingly, bypass velocities extrapolated by Applicant's witnesses for

rates of flow below 3,000 cfs at the intake would not be affected by exposure of the bar. (Applicant's Exh. 1-A; Boyer, Tr. 1412-13, 1417, 1675).

62. At flows of 3,000 cfs the edge of the eddy is at station 7+75. The intake is located at Station 8+62, 88 feet beyond the edge of the eddy. (Boyer, Tr. 1424).

63. Del-Aware's witnesses were unable to state whether the eddy would reach the intake or even what they consider to be the main current. (Kaufmann, Tr. 2117-18; Miller, Tr. 3059-60, 3133; Phillippe, Tr. 3753, 3757).

64. Even if eddy waters were to reach the intake, recirculation of water past the intake is not a significant problem. (Masnik, Tr. 3558).

65. The Del-Aware witness speculated but failed to establish that a cross current of 5° to 25° could pass by the screens. (Phillippe, Tr. 3735).

66. A cross current of 30° would have no effect on the protection afforded by the screens. (Harmon, Tr. 2807; Masnik, Tr. 4005).

67. Slot orientation perpendicular to flow provides some additional hydrodynamic protection to larvae, but a non-perpendicular slot orientation would not be a detriment. (Harmon, Tr. 2811-14; Brundage, Tr. 2970).

68. Perpendicular orientation of slots provides shortnose sturgeon larvae with a substrate from which they can spring off and escape from the screens. Even if the flow approaches the screens at a slight angle, it would not

affect the ability of larvae to escape from the screen. (Brundage, Tr. 2979, 3000-01).

69. At flows of 3,000 cfs, a maximum of 5 percent of the river flow would be withdrawn by the intake. (Masnik Testimony at 13; Harmon, Tr. 2398; Masnik, Tr. 3557; Emery 2063-64). At flows of 2,500 cfs, 5.9 percent of the water would be withdrawn. (Masnik, Tr. 3557).

70. This means that a maximum of 5 percent of aquatic life in the flow past the intake would be potentially affected at a 3,000 cfs rate of flow. (Masnik Testimony at 15; Masnik, Tr. 3557; Harmon, Tr. 2398; Emery, Tr. 2064).

71. The wedge wire screen affords 20-80 percent protection for the aquatic life in the maximum of 5 percent of the flow at 3,000 cfs that could potentially be affected by the intake. (Harmon, Tr. 2398, 2563).

72. The intake design and location are described on page 8 of DRBC Docket No. D-65-76 CP(8). Condition L of the Docket provides: "State and federal fishery managers should be satisfied that the final design of the intake structure is appropriate prior to construction." In an April 13, 1981 letter, the Executive Director of the DRBC informed NWRA that Condition L had been satisfied. (Del-Aware Exh. 1-C at p. 1).

73. A study conducted by Hanson exposed 1,318 specimens of 19 species of fish (none of which was shad or shortnose sturgeon) to profile wire screens. Only 260 specimens were impinged for a short period of time; 208

specimens eventually escaped from the screen. This was in the total absence of a bypass velocity (Brundage, Tr. 2972).

74. To the extent the situations are comparable, results of studies at other facilities support Applicant's conclusions as to the likelihood of impingement and entrainment at the Point Pleasant intake. (Masnik, Tr. 3547).

75. Larval fish generally show a counter current orientation. Physical contact with the intake will elicit a burst swimming response away from the screens. (Brundage, Tr. 3022-23).

76. The on-off pattern of operation of the intake will not affect fish. The pumps are equipped with a variable speed device which starts the pumps slowly so there will not be a sudden rush of water through the screens. The pumps will not be started simultaneously. (Boyer, Tr. 2418, 2603; Harmon, Tr. 2396).

77. Adult shad enter the Delaware River in early Spring (late March - early April) with peak migration occurring when the water temperature ranges from 56-60°F. (Applicant's Testimony at 7).

78. Shad spawning occurs from April through early June with the peak spawning period occurring in May. (Masnik Testimony at 11; Emery, Tr. 2061; Harmon, Tr. 2368; Masnik, Tr. 3558).

79. Flows in the Delaware River are generally high during the peak spawning period for fish generally. (Boyer,

Tr. 1364; Brundage, Tr. 2954, 3003). The percent of river flow withdrawn by the intake during this period is very small. (Applicant's Testimony at 8).

80. The main spawning grounds for shad are upstream of the Delaware Water Gap about 80-100 miles from Point Pleasant. (Masnik Testimony at 11; Emery, Tr. 1762; Harmon, Tr. 2420; Masnik, Tr. 4015).

81. There is no evidence that shad spawn at Point Pleasant, even though the area does contain a suitable spawning habitat. (Applicant's Testimony at 7; Masnik Testimony at 12; Masnik, Tr. 3559; Emery, Tr. 1762; Harmon, Tr. 2404; Kaufmann, Tr. 2101).

82. The intake system was designed and evaluated on the conservative assumption that shad would reinhabit the Point Pleasant area as a spawning ground (Harmon, Tr. 2405, 2408, 2508).

83. Shad eggs range from approximately 1.1 to 3.8 mm., with a mean of 2.83 mm. in size, and are slightly adhesive and demersal. They sink out of the water column rapidly and do not drift far from where they are spawned. They are normally swept under rocks and boulders. (Applicant's Testimony at 8; Masnik Testimony at 12, 16; Emery Tr. 1761, 1797; Masnik, Tr. 3993, 4006).

84. Spawning shad eggs will settle in the water column to the bottom approximately 5 to 35 meters from the point of spawning. (Emery, Tr. 1761).

85. These characteristics of shad eggs make it unlikely that shad eggs, even if present at Point Pleasant, would interact with the intake. (Harmon, Tr. 2573). Shad are not likely to spawn at the intake. (Kaufmann, Tr. 1961). Their size would prevent most shad eggs from entering the 2 mm. screen slot. (Applicant's Testimony at 8; Applicant's Exh. 2 at p. 1-2; Masnik Testimony at 16).

86. From the time the eggs are released until they are in a protected environment, there is a mortality rate of 99.99 percent. Any eggs which might be entrained in the intake would be those which had a higher probability of not surviving. (Masnik, Tr. 3560, 4007; Emery, Tr. 1761).

87. Three operating power stations have intakes in areas closer to the spawning grounds of the shad. They have had minimal impact on fish. (Harmon, Tr. 2852, 2894-97).

88. The transformation of shad from egg to larvae to juvenile takes place in about 4-5 weeks whereupon the fish are 20-30 mm. in length and assume a very strong schooling habit, which demonstrates a strong swimming ability. Juveniles are virtually completely protected. (Applicant's Testimony at 9; Harmon, Tr. 2416, 2853; Kaufmann, Tr. 2102, 2105; Emery, Tr. 2109, 2110; Miller, Tr. 3240).

89. Thus, the early life stages of shad have a very short period of potential vulnerability to entrainment. (Applicant's Testimony at 9; Harmon, Tr. 2853; Masnik Testimony at 17; Emery, Tr. 1871, 2109).

90. American shad are of the Alosa genus. Other members of the Alosa genus show behavior resistance to entrainment and impingement by wedge wire intake screens at a size less than necessary to achieve physical exclusion. (Applicant's Testimony at 9; Masnik Testimony at 17-18; Harmon, Tr. 2421, 2397).

91. In terms of ecological impact to the species, the loss of 5 to 10 percent of the shad larvae in the Point Pleasant vicinity would not be significant. (Masnik, Tr. 3560-62, 3575).

92. Juvenile shad utilize the Point Pleasant area as a nursery area. They would not be affected by the intake. (Applicant's Testimony at 7; Harmon, Tr. 2416; Emery, Tr. 1963-64).

93. Adult shad will pass through the Point Pleasant area during the migration. Healthy adult shad in the channel will not be affected by the intake. (Applicant's Testimony at 8; Masnik Testimony at 22-23; Emery, Tr. 1871, 1955; Kaufmann, Tr. 1882-83, 1950).

94. Shortnose sturgeon have never been observed at Point Pleasant. (Applicant's Testimony at 9; Masnik Testimony at 6; Harmon, Tr. 2681; Brundage Tr. 2928, 2990; Kaufmann, Tr. 1868).

95. The only documented capture of shortnose sturgeon above the fall line has been made at the shad haul seine fishery at Lambertville, New Jersey (river mile 119), 14 river miles above Trenton and 8 miles downriver of Point

Pleasant. Here two specimens were taken in 1975 and 11 in 1981. (Applicant's Testimony at 10; Emery, Tr. 1797-98).

96. A sampling program specifically designed to determine presence of shortnose sturgeon in the Point Pleasant intake vicinity during the proposed construction period (fall-winter) was conducted in 1981 for NWRA. Gill nets fished for a total of 816 hours but took no sturgeon. (Applicant's Testimony at 10).

97. In a recent 1981-82 shortnose sturgeon investigation, no shortnose sturgeon were collected upriver of Scudder's Falls (river mile 140). This study utilized appropriate sampling gear (gill nets) and would have collected sturgeon if present. This study captured over 170 sturgeon in the estuary. (Applicant's Testimony at 10-11).

98. Shortnose sturgeon spawn in fast current areas, (Brundage, Tr. 2927), in fresh water at or near the limits of the tide at a narrow band of temperature from 9-12°C. (Brundage, Tr. 2983-84). They spawn over rubble, cobble, or gravel bottoms. (Applicant's Testimony at 10; Masnik Testimony at 7).

99. Shortnose sturgeon eggs are spawned near the bottom. They water harden and are demersal and adhesive. The eggs are very dense and there is little opportunity for them to be transported in the water column. (Applicant's Testimony at 11; Masnik Testimony at 7; Brundage, Tr. 2969-70; Emery, Tr. 1798, 1801, 1814).

100. Shortnose sturgeon therefore have relatively little capacity for drift and would not be subject to entrainment if spawned more than 20 meters beyond the intake. (Emery, Tr. 1799).

101. Shortnose sturgeon eggs are approximately 3.2 mm. and are thus too large to pass through the 2 mm. slots. (Applicant's Testimony at 11; Masnik Testimony at 7; Brundage, Tr. 2969; Emery Tr. 1798).

102. If water hardened eggs encountered the slots, they would just roll along the slots in the majority of cases. (Brundage, Tr. 3028).

103. Another study performed by Hanson relied upon by Del-Aware to show that the likelihood of impingement and entrainment would be greater than estimated by Applicant involved striped bass eggs, not shad or shortnose sturgeon. The eggs of striped bass range from 1.3 to 2.7 mm., and are smaller than shad or shortnose sturgeon eggs. Additionally, they are not demersal. Also, the study involved an intake with higher intake velocity than that which will exist at Point Pleasant. Further, the study utilized a higher concentration of eggs by means of a flow recirculated in the flume up to 20 times, unlike conditions which would exist at Point Pleasant. (Emery, Tr. 2135-39; Brundage, Tr. 2935-36, 2987, 2991).

104. During the early days of life, shortnose sturgeon are very benthically oriented. There is essentially no movement off the bottom until they are 16 days old. During

this time they stay under rocks and in rock interstices. Then there is some movement off the bottom, but it is not significant. (Masnik Testimony at 7-8; Masnik, Tr. 3594; Harmon, Tr. 2517; Brundage, Tr. 2945-49; Kaufmann, Tr. 1869).

105. Given the spawning habits of shortnose sturgeon, the characteristics of its eggs, the design of the intake and flow characteristics in the area, shortnose sturgeon eggs will not be entrained in the intake. (Masnik Testimony at 8; Emery, Tr. 1870; Brundage, Tr. 2969-70, 2972).

106. The maximum length and age at which a shortnose sturgeon could be entrained is approximately 20 mm. in length or approximately 18.5 days old. At this size a shortnose sturgeon could be entrained only if it had its head pointed to the screen. That is a difficult position for the larvae, given the perpendicular orientation of the slots. (Masnik Testimony at 7; Brundage, Tr. 2943).

107. Shortnose sturgeon larvae show a strong swimming ability. A 16.5 mm. larvae has a swimming ability of 14.7 cm. per second (approximately .5 fps). By the time a larva reaches a size where it is impingeable, it can easily outswim the intake velocity. Before it reaches this size, it remains in the rocks and is invulnerable to impingement. (Masnik Testimony at 8; Brundage, Tr. 2972-73, 2988).

108. A shortnose sturgeon has the adult characteristics within 30 to 40 days. (Brundage, Tr. 2993). Adult shortnose sturgeon will not be affected by the intake. (Applicant's Testimony at 11).

109. The utilization of 2 mm. slots, the low intake velocity and the placement of the intake in the ambient current and the shortnose sturgeon's swimming capacity will essentially eliminate the possibility of shortnose sturgeon impingement. (Masnik Testimony at 8-9; Brundage, Tr. 2943; Harmon, Tr. 2396).

110. Adult shortnose sturgeon may remain near the spawning grounds after spawning or move downstream to upper estuary summer foraging areas where they may remain through winter. (Applicant's Testimony at 10).

111. The lower estuary may also function as a forage and overwintering area for shortnose sturgeon. (Applicant's Testimony at 10).

112. The National Marine Fisheries Service ("NMFS"), which has statutory jurisdictions over shortnose sturgeon, found in its Biological Opinion that the Point Pleasant project will cause no adverse effect on shortnose sturgeon. (Masnik Testimony at 5-6).

113. Del-Aware's ichthyological witness agreed that NMFS is the source of the best available information. (Kaufmann, Tr. 1868-69).

114. The finally selected location of the intake in the Delaware River meets biological criteria and no improvement will result from moving the intake further from the Pennsylvania shore. (Harmon, Tr. 2350, 2399, 2853; Brundage, Tr. 2959; Masnik, Tr. 4032).

115. Moving the intake further into the river will not reduce the risk of impingement or entrainment. (Masnik, Tr. 4032).

116. Although Del-Aware's witness contended that the entire intake structure was not in the deepest point of the river channel, he was unable to define the channel width. (Emery, Tr. 1924-25).

117. Del-Aware's ichthyological witnesses were unable to establish that relocating the intake further into the main channel would yield greater bypass velocity or in any way reduce the risk of entrainment or impingement of shad and shortnose sturgeon if present. (Emery, Tr. 1804-05, 1832; Kaufmann, Tr. 1958-60).

118. These witnesses noted that they had not made any measurements of velocity at Point Pleasant and conceded that velocity at the depth of the intake could not be determined without such measurements. (Kaufmann, Tr. 1914-15).

119. The main concern expressed by these witnesses was that the intake location was beyond the eddy in which shad juveniles congregate. They stated that they would be satisfied with the intake's location if this were established. (Kaufmann, Tr. 1959-60).

120. At the hearing, EPA's witness was unable to offer any facts or data tending to show any increase in environmental impacts resulting from the "relocation" of the intake. (Pence, Tr. 1486).

121. Operation of the intake will not have a significant impact on American shad, shortnose sturgeon or other fish resources in the Delaware River at Point Pleasant (Applicant's Testimony at 7-13; Applicant's Exh. 2 at pp. 1-3); Masnik Testimony at 5-6, 8-10; Harmon, Tr. 2396, 2884; Brundage, Tr. 2972) (Board Findings 11-115).

122. Operation of the intake will not affect the number of fish going upstream which would be game for fishermen. Although the intake may divert fish in the main channel to one side or the other, Del-Aware's witnesses conceded that it is purely speculative that fish would be disproportionately diverted toward either the Pennsylvania or New Jersey shore, or that Pennsylvania residents would be unable to fish along the New Jersey shoreline. (Kaufmann, Tr. 1792-94, 1948-50, 2129-30; Plevyak, Tr. 2018).

123. While Del-Aware's ichthyological witnesses stated that a shoreline location of the intake was ideal for avoiding diversion of shad away from fishermen on the Pennsylvania side of the river, they conceded that this would have a negative environmental impact on the shad population, which was the predominant concern. (Kaufmann, Tr. 1957-58).

124. Drawdown of the immediate river area is conservatively determined to be no more than 3/4 inch if all 4 pumps are operating at the same time (at 3,000 cfs river flow). (Applicant's Testimony at 13; Wescott Testimony at 3; Bourquard, Tr. 2591-92; 2602-03).

125. This fluctuation in water level is insignificant to fishes and will be overshadowed by fluctuations due to other causes unrelated to Point Pleasant pumping station operations (Applicant's Testimony at 13; Masnik Testimony at 25).

126. River level variations at any flow due to pumping would not be noticeable and far less than variations due to normal wind, current and flow effects. (Applicant's Testimony at 13).

127. No discernible surface water current or other effects are anticipated above the screens due to the pumping operation. (Applicant's Testimony at 13).

128. Boating and recreation will not be affected by drawdown of the pool; the intake's presence will be unnoticeable. (Applicant's Testimony at 13).

129. With a minimum water coverage of 4 feet over the screens, they will not present a hazard to boaters, rafters or water skiers. (Applicant's Testimony at 13; Bourquard, Tr. 2331).

130. The location of the intake will not adversely affect any major fish resource or boating and recreation in the area due to drawdown of the pool. (Board Findings 122-29).

Potential Impacts From Noise  
and Dredging Maintenance

131. Contention V-16a as litigated in this proceeding reads as follows:

Contention V-16a

Noise effects and constant dredging maintenance connected with operations of the intake and its associated pump station will adversely affect the peace and tranquility of the Point Pleasant proposed historic district.

132. The members of the Licensing Board conducted a tour of areas relevant to the two contentions. Specifically, the Board viewed the location for the intake structure by boat and viewed the Point Pleasant pumping station and surrounding environs from the adjoining towpath and roadway. The Board also viewed the Lumberville Dam and location for the Bradshaw Reservoir. (Dickinson, Tr. 2154).

133. NWRA conducted a site noise survey in 1981 to determine ambient noise levels. Noise levels were measured for a full 24-hour period, and it was shown that daytime levels were not significantly different from night time levels. The equivalent A-weighted sound levels ranged between 46 dB to 53 dB. (Applicant's Testimony at 13-14; Moiseev, Tr. 1039, 1042-44, 1077).

134. The principal local noise source is traffic on River Road. However, the area is also subjected to noise from motor boats on the river and blasting operations conducted in a nearby quarry. (Applicant's Testimony at 14; Moiseev, Tr. 1041-42, 1077).

135. The pumphouse is located 65 feet from the nearest property line. (Moiseev, Tr. 984).

136. The pumphouse dimensions are 85.5 feet by 60.5 feet by 44.5 feet in height. (Applicant's Testimony at 14; Boyer, Tr. 990).

137. The pumphouse will contain 4 vertical multistage centrifugal pumps driven by electrical motors. Three will be installed initially and the fourth when needed, estimated to be in the period from 1990 to 2000. The pumps will be approximately 50 feet below the floor of the pumphouse. (Applicant's Testimony at 14; Bourquard, Tr. 1062).

138. The pumphouse will also contain two two-stage electrically driven air compressors rated at 25 hp. (Applicant's Testimony at 14).

139. The pumphouse will be of concrete construction faced with decorative stone veneer or wood. All walls will be insulated. The floors will be concrete and the roof will be insulated concrete plank. There will be no windows (Applicant's Testimony at 14).

140. The pumps will have a decibel rating of 86 dB. (Bourquard, Tr. 988).

141. The concrete walls of the pumphouse will attenuate 50 to 60 dB. Considering the noise level in the pumphouse, minus 50 or 60 dB, there will be very little noise on the outside. (Moiseev, Tr. 983-86; Policastro, Tr. 1124-25).

142. In order to minimize noise emanating from the pumphouse, sound attenuating designs will be utilized for all ventilating system exterior inlets and outlets. The air

compressors take suction from the interior of the building. (Applicant's Testimony at 15; Policastro Testimony at 3; Moiseev, Tr. 1016-17).

143. Noise transmission is minimized within the structure through the use of acoustical lining on main ventilating and air conditioning ducts. (Applicant's Testimony at 15; Policastro Testimony at 3; Moiseev, Tr. 1016-17).

144. Noise generated by equipment operation within the pumphouse will be confined within the pumphouse structure and will not increase ambient levels at the site property line. (Applicant's Testimony at 15; Policastro Testimony at 3; Moiseev, Tr. 981, 984-86, 1003, 1062, 1078-79; Bourquard, Tr. 1062).

145. The availability of final specifications and plans would not improve the calculations as to noise levels from the pumphouse. (Moiseev, Tr. 1017).

146. The secondary source of power for the pumphouse will be supplied by local power. No emergency generator will be installed. There will be no need to add emergency or backup equipment. (Boyer, Tr. 1020-21, 1023).

147. Two low noise level transformers will be installed outside the pumphouse adjacent to the building. These "quiet transformers" will have a dB level of 57, or 10 dB lower than a standard transformer. (Boyer, Tr. 989-90, 1030-31; Bourquard, Tr. 988; Moiseev, Tr. 989, 1031).

148. These transformers are self-cooling, eliminating the need for cooling fans. (Applicant's Testimony at 15).

149. The transformers will be 15 to 20 feet apart and will be separated by a firewall. (Boyer, Tr. 991).

150. The noise from one transformer will not significantly affect the noise of the other transformer. (Bourquard, Tr. 989, 1058).

151. The noise from the transformers at the property line is approximately 36-38 dB. (Moiseev, Tr. 1029).

152. The noise contributions from these transformers will be less than ambient at the site property line, and will not be audible at the nearest residence. (Moiseev, Tr. 992, 1045).

153. It is no problem to construct sound wall barriers around the transformers at Point Pleasant to attenuate their sound so that it is not audible at the property line. (Moiseev, Tr. 1046, 1055; Policastro, Tr. 1153, 1158-59, 1178).

154. There is a space around the transformers for sound wall barriers, if needed. (Bourquard, Tr. 1047).

155. Applicant is committed to the operation of transformers so that there is no increase in the ambient noise level at the property line in the direction of the nearest residence. If necessary, Applicant will put sound wall barriers around the quieted transformers. (Applicant's Testimony at 15; Boyer, Tr. 1049; Moiseev Tr. 1055; Bourquard, Tr. 1047, 1053).

156. There would be no problem in measuring the noise level from the transformers after their installation and then, if necessary, constructing the necessary sound barrier walls. (Boyer, Tr. 1049; Bourguard, Tr. 1047; Policastro, Tr. 1178-79).

157. The peace and tranquility of the Point Pleasant proposed historic district will not be adversely affected by noise effects connected with the operation of the intake and its associated pumphouse. (Board Findings 132-57).

158. No maintenance dredging is anticipated because once construction is complete, the river bottom will be returned to its natural contours. (Applicant's Testimony at 15; Bourguard, Tr. 2255).

159. River borings at the intake site in 1981 showed little change in bottom grade since the initial survey made in 1967, 14 years previously. (Bourguard, Tr. 2606-09). Hurricane Agnes caused a severe flood in the Susquehanna, but did not have such an effect in the Delaware. (Applicant's Testimony at 15-16; Bourguard, Tr. 2178).

160. The intake structure is near the middle of the river channel. Flow velocities there should keep the bottom area under the intake swept clean. (Applicant's Testimony at 15).

161. Also, the channel bottom area under the intake will be rock riprapped to prevent erosion. (Applicant's Testimony at 16; Boyer, Tr. 2554, 2562, 2822-23; Bourguard Tr. 2551-55, 2562, 2822).

162. If any debris comes down the Delaware River from the Tohickon Creek, it will most likely be during floods, when the bar near Tohickon Creek will be topped over. This debris will flow along the west shore of the river, not the main channel. (Bourquard, Tr. 2431).

163. During floods, flows in the Delaware will generally exceed 90,000 cfs (2-year flood peak), which will submerge the intake by over 19 feet (El. 85-El. 66). The chance that objects will strike the intake is remote. (Applicant's Testimony at 16).

164. During high flows the river will have greater elevation and debris will not present a problem with the intake as it is located. (Boyer, Tr. 2439). During winter months the intake will be submerged by 5 or more feet of water. (Applicant's Testimony at 16; Boyer, Tr. 2537; Bourquard, Tr. 2436).

165. The intake will be protected by 12-inch steel guard posts. The guard post will deflect any debris coming down the river causing the debris to pass around the screens or lessening the impact of anything moving down the river. (Applicant's Testimony at 16; Boyer, Tr. 2541).

166. In the unlikely event that it is necessary to enter the river to clear debris from the intake, it would be done from boats with divers. (Applicant's Testimony at 16; Bourquard, Tr. 2440; Boyer, Tr. 2440).

167. Any fish hooks caught on the screens could likewise be removed by divers. (Emery, Tr. 1815).

168. During winter months when floating and frazil ice can be expected occasionally in the river, the intake will have minimal usage. Flow records for the Schuylkill River indicate that Delaware River water would be needed for operation of Limerick during the winter months very infrequently. (Applicant's Testimony at 16; Boyer, Tr. 2438).

169. Frazil ice occurs in waters of 32°; it is ice forming in the water at various depths in very small pieces of ice that move along with the current. It is not as solid as frozen surface ice. (Boyer, Tr. 2538-39).

170. In the unlikely event that frazil ice clogs the intake, it would be cleared by the air backwash system. Air jets have been shown to be relatively effective on the few occasions that frazil ice creates problems. (Bourquard Tr. 2436-37; Boyer, Tr. at 2437-38).

171. Ice does not occur around boulders, piers, bridge abutments and foundations presently in the river. Accordingly, there is no reason to believe that the intake will attract ice. (Boyer, Tr. 2537).

172. When ice floes or ice blocks occur, the river elevation would be high. There would be more than 3 feet of water above the intake. It is highly unlikely that any surface ice floe or block would submerge to the depth of the intake. (Boyer, Tr. 2537).

173. The screen and its framework rests upon a steel frame which is a 36-inch cylinder made of 1/2 inch

plate. It is highly improbable that such a substantial piece of steel could be damaged by ice or debris floating in the river. (Boyer, Tr. 2540-42).

174. Although Del-Aware's witness attempted to establish by photographs and testimony that subsurface ice and ice-impacted debris could damage the intake, there is no credible evidence subsurface ice would reach the intake or have a capacity to cause any damage. (McNutt, Tr. 3385 et seq).

175. Even if the intake's steel frame were damaged, it could be repaired by underwater welding. This would be a minor repair operation that would involve one boat or barge on the river. (Boyer, Tr. 2546-47).

176. If a screen section were damaged or blocked so that it could not be cleaned manually by divers, the required maintenance would involve unbolting the flange section, removing the screen and its supporting framework, and then making necessary repairs externally or replacing the screen. Unbolting the screen's 24-inch flange would present no problem to divers. (Boyer, Tr. 2539-40; McNutt, Tr. 3440).

177. There will be no constant dredging maintenance and noise effects connected with operations of the intake and its associated pump station will not adversely affect the peace and tranquility of the Point Pleasant proposed historic district. (Board Findings 133-77).

### III. CONCLUSIONS OF LAW

178. The Licensing Board has considered the entire record of the proceeding and all of the proposed findings of fact and conclusions of law submitted by the parties. Each of the proposed findings of fact and conclusions of law which is not incorporated, expressly or inferentially, in this Partial Initial Decision is rejected as being unsupported in fact or law or as immaterial to this decision.

179. Based upon the foregoing Findings of Fact which are supported by reliable probative and substantial evidence as required by the Administrative Procedure Act and the Commission's Rules of Practice, and upon consideration of the entire evidentiary record in this proceeding, the Board makes the following Conclusions of Law concerning the two contentions V-15 and V-16a(in part) and V-16a:

- (1) All environmental impacts associated with the operation of the Point Pleasant pumping station and intake structure are sufficiently understood such that the Licensing Board can make an assessment with reasonable assurance as to the potential for such impacts.
- (2) There have been no significant changes in such impacts as previously anticipated at the construction permit stage.
- (3) The environmental review conducted by the Staff pursuant to the National Environmental Policy Act

of 1969 as to such impacts has adequately addressed these matters and will be incorporated into the Staff's FES for Limerick upon its preparation and completion.

- (4) Environmental impacts associated with the operation of the Point Pleasant pumping station and intake structure are insignificant and are extremely unlikely to tilt the ultimate cost/benefit balance against the issuance of operating licenses for the Limerick facility. The Board has weighed all environmental costs attributable to the operation of the Point Pleasant pumping station and intake structure and has independently considered the final balance among the various factors contained in the record of this proceeding, the Board determines that there have been no significant changes with regard to potential environmental impacts associated with the operation of the Point Pleasant pumping station and intake, and that there is no basis for a stay of the construction of this facility.
- (5) The Board has thoroughly considered the foregoing Findings of Fact concerning the issues in controversy in this operating license proceeding and other matters which have been addressed in this Partial Initial Decision and has concluded that none of the matters raised herein involving

environmental considerations precludes going forward with the activities relating to this facility authorized by the Delaware River Basin Commission, United States Army Corps of Engineers and other agencies.

- (6) After installation of the two low noise level transformers to be installed outside the pumphouse, Applicant shall conduct such tests as may be necessary to determine whether noise from the transformers increases the ambient noise level at the site property line in the direction of the nearest residence. If so, sound wall barriers around the transformers shall be constructed to assure that noise from the station does not exceed the ambient level at the boundary toward the nearest residence.

ORDER

180. WHEREFORE IT IS ORDERED in accordance with 10 C.F.R. §§2.760, 2.762, 2.764, 2.785 and 2.786 of the Commission's Rules of Practice, that this Partial Initial Decision shall become effective immediately and shall constitute with respect to the matters decided therein the final action of the Commission forty-five (45) days after the date of issuance hereof, subject to any review pursuant to the Commission's Rules of Practice.

181. Exceptions to this Partial Initial Decision may be filed by any party within seven (7) days after service of

this Partial Initial Decision. Within fifteen (15) days thereafter (twenty (20) days in the case of the Staff), any party filing such exceptions shall file a brief in support thereof. Within fifteen (15) days of the filing of the brief of the appellant (twenty (20) days in the case of the Staff), any other party may file a brief in support of, or in opposition to, the exceptions.

IT IS SO ORDERED.

THE ATOMIC SAFETY AND LICENSING BOARD

Judge Lawrence J. Brenner, Chairman

Judge Peter A. Morris, Member

Judge Richard F. Cole, Member

Dated at Bethesda, Maryland,  
this \_\_\_\_\_ day of \_\_\_\_\_

APPENDIX A

1. Exhibits received into evidence:

Staff Exhibits

<u>No.</u>	<u>Received</u>	<u>Identified</u>
1 Drawing of American Shad, 21 mm. larva.		3223
2 Exhibit 4 from Applicant Exhibit 2, Point Pleasant Pumping Station, Delaware River Channel Section at Water Intake.		3487
3 Exhibit 5 from Applicant Exhibit 2, Point Pleasant Pumping Station Location and Layout Plan, General Profile, December 22, 1981, revised January 13, 1981.	3488	
4 Exhibit 10 from Applicant Exhibit 2, Point Pleasant Pumping Station Intake Screen Assembly and Piping Details, September 1, 1981, revised January 13, 1982.	3488	
5 Assessment of the impacts of the proposed Point Pleasant Pumping Station and intake structure on the shortnose sturgeon, by H. Brundage, 1982.		3501

Applicant Exhibits

<u>No.</u>		<u>Received</u>	<u>Identified</u>
1	Environmental Report Section (with index), including portions of Exhibits 1, 1A and 1B directly applicable to contentions.	949	937, 974
1A	September 3, 1982 Responses to Requests for Additional Information.	949	937
1B	September 17, 1982 Responses to Requests for Additional Information.	949	938
2	January 22, 1982 letter from E.H. Bourquard to Corps of Engineers with Table 1.	1328	1324
3	Applicant's list of Exhibits and other documents which the Licensing Board is requested to officially notice.		1334
4	Map of Point Pleasant showing location of intake.	2154	2152
5	Letter from P.L. Harmon to E.H. Bourquard (revision of Table 1 in November 1980 report), dated May 11, 1981.	2829	2829
6	Letter from R.L. Baldwin, Corps of Engineers to H.N. Larsen, U.S. Fish and Wildlife Service, dated September 24, 1982, concerning Notice of Intent to Issue a Department of Army Permit to NWRA.		3179

Del-Aware Exhibits

<u>No.</u>		<u>Received</u>	<u>Identified</u>
1-A	Issue #1 Response on water quality data at Point Pleasant.	1313	1299
1-B	Issue #2 Response on sea level elevation of Lumberville Dam.	1313	1300
1-C	Issue #4 Response on further assessments of intake location after 1980 Environmental Assessment.	1313	1301
1-D	Issue #6 Response on cross section data on Delaware River at Point Pleasant.	1313	1302
1-E	Issue #7 Response on status of Point Pleasant withdrawal in Recommendation 13.		1302
1-F	Issue #5 Response on current status of Merrill Creek project.		1302
2	Tabulation of available data and Delaware River Flow Velocities at Intake Site (3).		1376
3	Water Quality Analyses, Area-Specific Dilution Studies, Region III, January 1981.		1449
4	Water Quality Analyses, Ten Area-Specific Dilution Studies.		1460
5	Letter to Mr. Hansler from Mr. Torok dated March 12, 1980.		1465
6	Letter to Col. Baldwin from Mr. Pence dated March 17, 1982.	1494	1471
7	Development of Relationship Between Water Discharge and Water Surface Elevation, January 4, 1982.		1639
8	Draft - Background Report Concerning the Interstate Water Management Recommendations of the Parties to the U.S. Supreme Court Decree of 1954 to the DRBC (Without Appendices).		1660

<u>No.</u>		<u>Received</u>	<u>Identified</u>
9	Letter to E.H. Bourquard from P.L. Harmon dated July 28, 1981 and three Tables on Velocity Measurements.	2225	2211
10	The American Shad ( <i>Alosa sapidissima</i> ) in the Delaware River, by J.P. Miller, F.R. Griffiths and P.A. Thurston-Rogers.		2227
11	Rating Curve - Point Pleasant Intake Site.		2275
12	USGS Data Sheets for October 1980, May 1981 and July 1981.	2329	2320
13	Point Pleasant Pumping Station Preliminary Design, Sheets 1, 2 and 3 of 4.		2321
14	Letter to W.H. Dickinson from E.H. Bourquard dated August 10, 1982, including Tables.		2392
15	Memorandum from W.H. Dickinson, "Mechanical Engineering Division," dated May 14, 1982.		2460
16	Memorandum from D.L. Morad, "Making Water System Status Report," dated December 16, 1981.		2465
17	Memorandum of meeting of January 5, 1982 (2 pages) including Figures and Excerpts of Hansen paper, by E.H. Bourquard.		2570
18	Actual versus Measured Readings (Rangefinder) dated March 1981 (Tables) from handwritten note from Mr. Bourquard to Mr. Harmon dated March 10-11, 1981.		2758
19	Delaware Intake Points Below, Real and Actual Distance from Split-Image Measuring Devices, E.H. Bourquard, dated March 10, 1981.		2768
20	Letter from H.M. Brundage III to R.A. Flowers, dated July 27, 1982.		2966

<u>No.</u>		<u>Received</u>	<u>Identified</u>
21	Single page, marked "13," excerpted from "Assessment of the impacts of the proposed Point Pleasant Pumping Station and intake structure on the shortnose sturgeon."		2975
22	Letter from H.M. Brundage III to E.H. Bourquard dated November 30, 1981.		3026
23	Letter from C. Culp, U.S. Fish and Wildlife Service to R. Baldwin, dated September 14, 1982.		3342

UNITED STATES OF AMERICA  
NUCLEAR REGULATORY COMMISSION NOV -9 P1:30

Before the Atomic Safety and Licensing Board  
OFFICE OF SECRETARY  
DOCKETING SERVICE  
BRANCH

In the Matter of )  
 )  
Philadelphia Electric Company ) Docket Nos. 50-352  
(Limerick Generating Station, ) 50-353  
Units 1 and 2 )

APPLICANT'S RESPONSE TO LICENSING BOARD'S REQUEST  
FOR INFORMATION REGARDING HISTORICAL RECORD OF FLOWS  
FOR THE SCHUYLKILL RIVER AND EAST BRANCH PERKIOMEN CREEK

Near the conclusion of the recently completed hearings on supplemental cooling water issues, the Atomic Safety and Licensing Board ("Licensing Board" or "Board") requested Philadelphia Electric Company ("Applicant") to provide the Board and parties with certain information to assist it in ruling on the admissibility of proposed contention V-24 as submitted by Del-Aware Unlimited, Inc. ("Del-Aware"). <sup>1/</sup> The proposed contention relates to the use of one versus two units at Limerick in evaluating the cost/benefit balance for the facility.

Specifically, the Board requested information as follows:

Using only waters available from the Schuylkill River and the Perkiomen Creek and considering the DRBC conditions on flow and temperature restrictions and considering no flow from the Delaware

---

1/ Tr. 3620-28 (October 25, 1982).

River -- that is, as if the Point Pleasant diversion did not exist -- please determine based upon the available historical record of flows what percentage of time, or average number of days per year, if you prefer to express it that way, would an operation of at least one unit be permitted; and, (B) operation of two units be permitted.

Now, in addition to simply answering the question as phrased, and most importantly we insist that the basic underlying data with a year-by-year breakdown be provided, showing us the basis upon which the answer was formulated. The result of the answers supported by the data should give us the percentage of time that one or more units could operate and also the percentage of time that two units could operate. And the difference, of course, would give us the percentage of time falling in between that.

In addition, the Board also requests any information available that would modify those predictions of future flows of between 529 and 560 c.f.s. in the Schuylkill at Pottstown, which are based solely on historic data.

The last question, to state it another way, is to give us information as to any changes that are now ascertainable in the water supply available that would be pertinent to the situation of one unit operating but not to two units operating, which we should consider, the parties should provide that.

The underlying data and conclusions as to when one or two units would have been permitted to operate is contained in attached Appendices A and B.

The availability of water storage on the Schuylkill River is not expected to change in the foreseeable future. Currently, there are two reservoirs on the Schuylkill River

upstream of the Limerick Generating Station. The Ontelaunee reservoir in Berks County is used for local water supply. The Blue Marsh Reservoir, also in Berks County, completed in 1977, is used primarily for replacing depletive uses, meeting instream needs and flood loss reduction. Neither of these reservoirs has excess capacity that could be used to meet Limerick's needs.

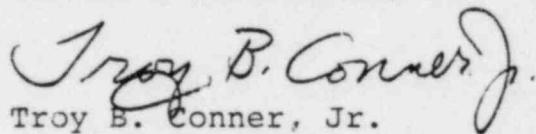

After the 1976 decision to defer construction of Tocks Island, the Delaware River Basin Commission ("DRBC") directed the power companies that operate in the basin to start planning for their own reservoir storage. The utilities acting as the Delaware River Basin Electric Utilities Group ("DRBEUG") selected four reservoir site alternatives, two in the Schuylkill River basin (Mill Creek and Red Creek) and two in the Delaware River basin (Little Martins Creek and Merrill Creek). Merrill Creek was selected as the site for the reservoir. Engineering has progressed on the Merrill Creek project. Applications have been submitted and are awaiting approval from various regulatory agencies. After selection of Merrill Creek as the most suitable reservoir site, no further developmental work was done on the other less environmentally suitable sites.

There are two other reservoir sites in the Schuylkill River basin that were contained in DRBC's comprehensive plan. However, the Maiden Creek Reservoir proposed to be built in Berks County has been dropped from the

comprehensive plan. The Evansburg Reservoir in Montgomery County remains in the plan but no dates or plans have been set for construction. If Evansburg Reservoir were to be built for water supply, it could barely meet the average daily demand deficiencies in central Montgomery County. <sup>2/</sup> The Pennsylvania Department of Environmental Resources concluded:

"Both the State Water Plan and the DRBC Level B study indicate that technical, environmental, economic or social conditions virtually preclude development of significant new surface water storage facilities in the Schuylkill River Basin in the foreseeable future." <sup>3/</sup>

Respectfully submitted,  
CONNER & WETTERHAHN, P.C.

## APPENDIX B

MECHANICAL ENGINEERING DIVISION  
N2-1 2301 Market StreetMEMORANDUM

Subject: Availability of Make-up Water  
 Schuylkill River & Perkiomen Creek  
 Limerick Generating Station

An analysis of the water availability from the Schuylkill River and Perkiomen Creek for use in the condenser cooling water system, assuming one unit and two unit operation, was made based on the DRBC conditions regarding flow and temperature.

The results of the analysis are presented below:

Calendar Year	Days Data Available	Days Water is Available			% of Days per Year Water Available		
		1 Unit	2 Units	Difference	1 Unit	2 Units	Difference
1971	92*	80*	75*	5	87*	82*	5
1972	365	261	252	9	72	69	3
1973	365	247	245	2	68	67	1
1974	364	248	236	12	68	65	3
1975	334	270	264	6	81	79	2
1976	263	181	179	2	69	68	1
1977	242	148	144	4	61	60	1
1978	236	176	170	6	75	72	3
1979	365	287	272	15	79	75	4
1980	364	164	157	7	45	43	2
1981	149*	129*	123*	6	87*	83*	4

\* Based on a partial year's data.

Data Used to Evaluate 1 versus 2 Unit Availability of Schuylkill River  
and Perkiomen Creek Water for Operation of Limerick Generating Station

I. Schuylkill River Temperature Data Used (degrees Centigrade)

<u>Period</u>	<u>Location<sup>a</sup> of Measurement</u>
10/1/71-9/30/75	S90900-5 Pottstown Water Filtration Plant (Daily log sheets)
10/1/75-12/31/75	S77440-3 RMC (PECo) Data Obtained Near LGS Site (weekends
1/5/76-12/20/78	S77660-3 and holidays missing)
1/1/79-5/31/81	S90900-5 Pottstown Water Filtration Plant

II. Schuylkill River Flow Data Used (coded as station S77660-3)  
(meters<sup>3</sup>/sec.)

10/1/71-9/30/80	USGS Gage (#01472000) at Pottstown (final data)
10/1/80-5/31/81	Provisional Data

III. Perkiomen Creek Flow Data Used (coded as P14390-3) (meters<sup>3</sup>/sec.)

10/1/71-9/30/80	USGS Gage (#01473000) at Graterford (final data)
10/1/80-5/31/81	Provisional Data

<sup>a</sup>Alpha-numeric designator is stream (S = Schuylkill River, P = Perkiomen Creek) and five-digit river meter distance from mouth of stream

Flow conversions:	<u>cfs</u>	=	<u>meters<sup>3</sup>/sec.</u>
