NIAGARA MOHAWK POWER CORPORATION/ 301 PLAINFIELD ROAD, SYRACUSE, N.Y. 13212/TELEPHONE (315) 474-1511

U. S. Nuclear Regulatory Commission Attn: Document Control Desk Washington, D. C. 20555

> Re: Nine Mile Point Unit 1 Docket No. 50-220 DPR-63 TAC No. 68570

Gentlemen:

By letter dated November 20, 1990, the Nuclear Regulatory Commission requested Niagara Mohawk to submit additional information regarding station blackout. The requested information was to be submitted by January 4, 1991, in order for the Staff to complete its evaluation of Nine Mile Point Unit 1. This letter is to inform you of a delay in our submittal.

Niagara Mohawk retained two outside consulting firms to assist in the preparation of our response to the Staff's request for additional information. This assistance included a reanalysis of reactor coolant system inventory, a transient analysis of Control Room heat-up, and an analysis of containment heat-up. The results of these analyses were received during the week of December 31, 1990. However, the actual hard copy documentation has not yet been received for the Control Room and containment heat-up analyses.

To provide assurance that these analyses are accurate and reflect present plant configuration, an internal independent review and verification will be performed by Niagara Mohawk. Niagara Mohawk believes that the completion of its internal review is necessary based on the complexity of these analyses and their importance in demonstrating the ability of Nine Mile Point Unit 1 to withstand and recover from a station blackout. Therefore, we have chosen to delay our response until this review is complete. As discussed with our Project Manager, Mr. D. S. Brinkman, we plan to delay submitting our response until January 25, 1991.

Very truly yours,

January 7, 1991 NMP1L 0558

Docket No. 50-286 License No. DPR-64

Mr. Thomas T. Martin Region I Administrator U.S. Nuclear Regulatory Commission 475 Allendale Road King of Prussia, PA 19406

Dear Mr. Martin:

In accordance with 10CFR50.54(q), one (1) copy of the most recent revisions to our Emergency Plan has been sent to the NR<sup>-</sup> Document Control Desk in Washington, D.C. and one (1) copy has been sent to your office, Emergency Preparedness Section. These changes have been determined not to decrease the effectiveness of the Indian Point 3 Emergency Plan and the Plan, as changed, continues to meet the standards of 10CFR50.45(b) and Appendix E.

In addition, as requested by your staff, a second copy has been forwarded to your Emergency Preparedness Section and one (1) copy has been provided to the IP-3 Resident NRC Inspector.

Sincerely, ause

Joseph E. Russell Resident Manager Indian Point No. 3 Nuclear Power Plant

Restatement of Violation

10 CFR 50.55a(g) requires implementation of an Inservice Testing (IST) program for pumps and valves whose function is required for safety in accordance with the applicable edition of the ASME Boiler and Pressure Vessel Code, Section XI. The applicable edition of the Code for the purpose of the IST program is the 1980 Edition through Winter of 1981 addenda. Three examples of failure to adequately implement the provisions of the Code in administrative and technical procedures were identified:

1. Section XI, Article IWV 34.3, requires that Category A and B valves that cannot be exercised every 3 months during plant operation shall be exercised during cold shitdowns. The "Peach Bottom Atomic Power Station Units 2 and 3 Pump and Valve Inservice Testing Program," Section 5.2.2, states that valve testing will commence within 48 hours after reaching cold shutdown and will continue until all tests are complete or the plant is ready to return to power. Any testing not completed at one cold shutdown will be performed during subsequent cold shutdowns.

Contrary to the above, as of October 29, 1990, the licensee's IST program scheduling and implementing procedures did not contain provisions to ensure that cold shutdown testing is initiated consistently and in a timely manner, nor to ensure that all components are tested during periods of cold shutdown. As a result, not all required testing was conducted during periods of cold shutdown during this operating cycle.

Section XI, Article IWV 3510, requires that safety and relief valves be periodically tested. The licensee's IST program requests exemption from IWV 3510, and use of ANSI/ASME OM-1-1981 as an alternative test requirement. Both IWV 3510 and OM-1 require that when a valve fails to function properly during a regular test, an additional sample of valves will be tested.

Contrary to the above, as of October 29, 1990, the licensee had not established IST program implementing procedures or responsibilities to ensure that the expanded test sample required following a test failure would be performed.

Section XI, Article IWV 3410, states that Category A and B valves shall be exercised at least once every three months. The necessary valve disk movement shall be determined by observing an appropriate indicator or observing indirect evidence, such as changes in system pressure or flow rate, which reflect disk position. The "Peach Document Control Desk January 7, 1991 Page 4

> Bottom Atomic Power Station Units 2 and 3 Pump and Valve Inservice Testing Program," states that the core spray and residual heat removal minimum flow line check valves will be exercise tested quarterly in the forward direction.

Contrary to the above, as of October 29, 1990, the licensee had not established technically adequate procedures for performance of the forward direction testing of the core spray and residual heat removal minimum flow line check valves in that the procedures did not require observation of either direction or indirect evidence of valve disk movement.

This is a Severity Level IV Violation (Supplement I).

## Cause of the Violation (Example 1)

Programmatic controls of the Peach Bottom Inservice Testing (IST) Program for testing valves at cold shutdown were not properly implemented. Surveillance Test (STs) were written to implement this testing; however, effective means to ensure that these tests were performed during cold shutdown were not put into place. Additionally, controls were not properly implemented to ensure that testing initiated during shutdown that was not completed prior to returning to power would be completed during a subsequent shutdown. Since the IST program STs are event dependent, the program to issue and track routine STs does not effectively schedule these tests. A listing of the cold shutdown surveillance tests was forwarded to the ST Coordinator by the IST Coordinator, but the listing was used as a reference and for information only. Poor communication resulted in the lack of an action plan from either party to effectively track the progress of the unscheduled STs. There also was a lack of coordination to ensure that other administration or programmatic controls were in place to verify that the components were tested at the correct frequency and tracked. The potential for event dependent tests not being performed when required was identified by an in-house investigation, but corrective actions were not yet complete.

#### Corrective Action Taken

During the Unit 3 mid-cycle outage, three of the appropriate cold shutdown tests were performed prior to plant restart. All cold shutdown surveillance tests have been included in the scope of the Unit 2 Refueling Outage, beginning January, 1991.

### Cause of Violation (Example 2)

During the implementation of the IST program, relief valve testing was placed in the Preventative Maintenance (PM) program. This was done to ensure that the valves would be tested at the correct frequency, alleviating the need for additional surveillance test procedures. The requirement to ensure that expanded testing is performed following a test failure was addressed by Document Control Desk Jánuary 7, 1991 Page 5

Administrative Procedure A-127, "In-Service Testing"; however, adequate implementing procedures were not written to address the additional testing. The failure to initiate the appropriate controls to provide additional testing following a test failure and the lack of communication between Maintenance and the IST group to ensure the testing was performed were the cause of noncompliance.

#### Corrective Actions Taken

A review was conducted to verify that relief valves in the IST Program were included in the Preventative Maintenance Program. Additionally, a review of relief valves tested since the inception of the IST program w s conducted to determine the number of failures that have occurred where additional testing was not performed. This review identified only one occurrence where this requirement was not met. An effort is currently underway between the IST group and Maintenance Engineering to develop procedural controls that adequately address the requirements.

#### Cause of Violation (Example 3)

During the initial writing and subsequent review of the surveillance tests used to exercise the Core Spray (CS) and Residual Heat Removal (RHR) minimum flow check valves, steps to verify the opening of these valves were overlocked. Although quarterly testing is performed on each pump which verifies that the motor operated minimum flow valves open, verification of check valve stroke determined by either direct or indirect observation was not performed.

#### Corrective Actions Taken

A review of the appropriate STs rewritten by the ST Rewrite Project identified the inadequacy of the procedure for system testing. A Corrective Action Request (CAR) was initiated by the IST Coordinator to incorporate the appropriate testing into the relevant STs and to track these revisions to completion. In addition, the Nuclear Quality Assurance Division performed an audit to determine if additional component testing is adequate, or if any other programmatic weaknesses can be identified. As a result of this audit, there is a high level of confidence that other valves are appropriately tested.

## Corrective Steps That Will Be Taken to Avoid Future Violations

The Performance and Surveillance Group has developed an IST Program Review Plan which is scheduled for completion April 30, 1991. This review consists of six phases which are designed to assure program compliance with ASME Section XI for pump and valve testing, and to ensure consistency between PECo administrative procedures. Additionally, the specific implementation procedures or methods used to comply with the regulations are being reviewed for adequacy. During this review process methods to ensure proper cold shutdown testing is performed will be evaluated and the most appropriate methods will be implemented. The method to perform expanded relief valve

testing following any setpoint test failure will be enhanced, as well as the process for the quarterly verification of minimum flow check valve disk movement for the CS and RHR systems.

The appropriate scheduling, issuance, and tracking of IST ST's will also be enhanced through the completion of corrective actions associated with the recent review and analysis of an in-house investigation report on surveillance testing. The technical adequacy of the IST ST's and their acherence to IST Program requirements will be confirmed through the ST Rewrite Project.

1.635

## Date When Full Compliance Will Be Achieved

Full compliance will be achieved by April 30, 1991 after the IST program revisions can be fully evaluated and implemented. Testing and inspection requirements of 10 CFR 50.55a(g) are currently in compliance. Interim compliance with the IST program until April 30, 1991 has been assured.
