Re: Export License Application  
TNY Ref: NUK-519

Dear Betty:

Enclosed is an export license application, along with the end use statement and its reactor checklist for your handling on the following:

30.147 Kgs Uranium-235, contained in 32.261 Kgs Uranium,  
in the form of metal, enriched to 93.45 w/g maximum Uranium-235.

The above figures include tolerances.

If you have any questions, please do not hesitate to call.

Yours truly,

TRANSNUCLEAR, INC.

END USE STATEMENT

The undersigned certifies that the following material, i.e. 32,1 kg of uranium (93,3 % U-235 enriched) in the form of METAL and containing 29,95 kg of U-235 that will be furnished to us under a short term fixed-commitment contract with US-DOE, will be used for BR2 reactor.

We authorize TRANSNUCLEAR Inc., two Skyline Drive Hawthorne, New-York to apply for the US export license.

Manufacturing of the fuel elements will be performed by CERCA, Romans, France.

F. GUBEL  
Head of BR2 department

C. MALBRAIN

CHECKLIST FOR USE IN REVIEW OF REQUESTS FOR HEU TO DETERMINE  
TECHNICAL AND ECONOMIC JUSTIFICATION  
BR2 REQUEST

1. Name of reactor and facility: BR2
2. Location: Belgian Nuclear Research Centre  
(C.E.N./S.B.K.)  
B-2400 MOL - BELGIUM
3. Quantity of uranium requested (kg U): 32.1 kg U<sub>tot</sub>
4. Enrichment in the isotope U-235: 93.30 %
5. Quantity of uranium requested (kg U-235): 29.95 kg U-235
6. Type of fuel element and form of uranium:  
Assemblies of concentric cylindrical tubes, where the fuel is under the fuel is under the form of UAl<sub>x</sub> powder (x ≈ 3), 1.27 gU/cm<sup>3</sup>, mixed with aluminium and burnable poisons added as powder.
7. Current reactor power: level (MW th):  
Current reactor power: 60 to 100 MWth  
Depending on the experimental loading.  
Maximal reactor power: 125 MWth  
Current maximal heat flux: 470 W/cm<sup>2</sup>  
Maximal nominal heat flux: 600 W/cm<sup>2</sup>
8. Duty factor: see appendix 1.  
Average burn-up: a) of a load, end of cycle  
if 6 to 7 % of experiments: 37 %  
b) of eliminated fuel elements: 54 ± 4 %
9. a) Current core loading (kg U-235):  
8 to 12 kg U-235, depending on the experimental loading  
b) Amount of fuel per element (kg U-235):  
400 g U-235 for a standard fuel element  
c) Number of elements in core:  
27 to 40, depending on the experimental load, routinely 31 fuel elements  
d) Average core life: One fuel element serves for 10 running weeks, i.e. 5 cycles of 2 weeks or 4 cycles of 3 weeks

- e) Active core and reflector dimensions:
- height 914 mm
  - diameter 1100 mm
  - hexagonal lattice 96.44 mm pitch
  - fuel active height 726 mm

f) Neutron flux:

	$\int_0^{0,5eV} n(E) \cdot dE$	$\int_{0,1MeV}^{\infty} \phi(E) \cdot dE$
Central Be plug	$9 \cdot 10^{14} \text{ n/cm}^2\text{s}$	$1.4 \cdot 10^{14} \text{ n/cm}^2\text{s}$
Standard fuel element	$\leq 3.8 \cdot 10^{14} \text{ n/cm}^2\text{s}$	$\leq 7 \cdot 10^{14} \text{ n/cm}^2\text{s}$
Driver fuel element ( $\phi$ 200 mm)		$7 \cdot 10^{14} \text{ n/cm}^2\text{s}$

10. Annual fuel usage (kg U-235):  
 Routinely, 75 fuel elements type VIn, or 30 kg U-235.  
 In case of development of the safety programme for fast reactor:  
 1 fuel element  $\phi$  200 mm or  $\approx$  2 kg U-235.  
 In case of starting of the fusion programme:  
 20 fuel elements type Vn or 7,2 kg U-235.
11. Annual spare fuel requirement (kg U-235): 30 kg U-235 minimum in the form of METAL.
12. Plans to increase, decrease reactor power level:  
 We continuously optimize the reactor performances: specific and total power, energy produced, number of fresh fuel elements to be used for an imposed cycle length, taking into account the experimental loading. The present trend is to increase the available fast flux and consequently the specific power, maintaining the maximum thermohydraulic characteristics of the reactor.
13. Estimated annual supply of current fuel request: 30 kg U-235 minimum.
14. Required manufacturer's working stock, if any, included in this request: The manufacturer's working stocks are not included in this request. For a normal order of 100 standard fuel elements, the manufacturer requires the availability of 27 kg U-235 above the quantity necessary for the production:  
 [(100  $\times$  0.4 Eg) + losses + 27  $\approx$  68 kg U-235]
15. Fabrication loss, if any, included in this request (kg U-235): 2 x

included in this appendix.

- 16. Name of manufacturer: COGEMA BP-4 F-78141 Vélizy France.
- 17. Fabrication of fuel: CERCA Reims-Saint-Isaïre, France
- 18. Inventory on October 26, 1990.

The complete inventory is given at appendix 2. Find hereafter the detailed items of this inventory concerning usable fuel for the reactor BR2.

stock fresh fuel	n fuel el	U-tet [kg]	U-235 [kg]	HEU	Remark
COGEMA		31.442	29.854	0.9967	a) not available at present time
CERCA					
Scrap		7.100	6.530	0.9197	c) to be recovered
FAKFAAL (see G SCRAPS		70.067	70.060	0.9140	b) partially available
last supply		25.226	23.574	0.9345	c) shipped on October 25, 1990
DOE (U.S.A.)		0.000	0.000		
BR2-BR02 (Mol-Belgium)					
standard fresh fuel	36	15.447	14.363	0.9298	b) only 5451 Mwd
for experiments	9	3.534	3.285	0.9296	b) not usable
special type	21	5.321	4.784	0.8991	b) not usable *)
usable spent fuel	172	55.557	47.400	0.8532	d) only 10484 Mwd

- Remarks:
- a) scraps and UF6 to be recovered.
  - b) fabricated unirradiated stored fuel.
  - c) unirradiated non-fabricated and fabricated fuel.
  - d) spent fuel stored until residual 200 g U-235 /fuel el.
  - \*) to restart the reactor after a prolonged shut-down (<sup>3</sup>He-poisoning).

19. Date at which the available and usable inventory will be expended:  
February 1993.  
Date at which current inventory, including a, b, c (usable), will  
be expended: October 1993.
20. Date current requested fuel will be needed at reactor:  
February 1992, while the working stock is maintained at 27 kg  
U-235 in CERCA.
21. Date current requested fuel will be needed by fabricator:  
October 1991.
22. Time taken for shipment from USA to convertor/fabricator:  
a) lead time for ordering in USA: six months.  
b) shipment in and from USA: six months.  
c) conversion UF<sub>6</sub> → U-metal: twelve months.
23. Date at which current requested fuel will be expended i.e., when a  
further HEU supply will be needed at reactor: February 1993.  
The current date scheduled for the replacement of the Beryllium  
matrix is mid-1995, which will cause nine months approximately a  
one year shutdown.
24. Dates at which reactor could be converted to 45 % fuel; to 20 %  
fuel, including time required for licensing procedure:  
No date is fixed yet for BR2; in routine, it will not be before  
several years, as for other high flux reactors: ATR, HFIR, MFR in  
Grenoble ... From what we know, tests of fuel plates U<sub>3</sub>Si<sub>2</sub>-Al  
(≥ 4.8 g U/cm<sup>3</sup>) are satisfying and the industrialization of the  
process is in under way. For the future (at a time still to be  
defined), it would be possible, if requested, to use MEU  
(45 % enrichment) at the BR2 reactor. The time required for  
licensing procedure is equal to a successful irradiation campaign  
and post-irradiation examination of prototype fuel elements,  
increased by six months for reports, when the reprocessing of this  
fuel has been demonstrated feasible technically and economically.  
The use of LEU in BR2 demands the availability of fuel plates  
containing U<sub>3</sub>Si<sub>1</sub>-Al (≥ 7.1 g U/cm<sup>3</sup>). No prevision can be given  
concerning the reliability of this fuel, which is required in  
order to attain the density level of LEU required for the  
BR2-reactor.

25. History and dates of previous HEU supplies by the U.S.:

Continuously, since June 08 1959, has U.S. supplied HEU for the reactors BR2, BR02 and third parties. The last delivery of 25 kg HEU for which the licence XSNM-02495 was issued on July 16, 1990, has been shipped from USA to Europe on October 23, 1990. The BR2 reactor has reduced its stock of available U-235, reducing the stock of partially burnt fuel element at minimum and recovering all scraps considering the increase of the number of planned experiments, an annual supply greater than 30 kg U-235 is foreseen after the year 1991. The appendix 3a and 3b give the details concerning respectively the deliveries of U-235, transfer of fuel for hot reprocessing and supply to third parties. The figure 3c gives the burnup spectrum of usable standard fuel elements at BR2.

26. Amount of fuel of U.S.-origin previously consumed during operation of reactor:

The total amount of uranium received up to October 23, 1990 is:

1332,774 kg U-235.

The total amount of uranium burnt to October 26, 1990 is:

$1.24 \text{ g U-235/gWd} \times 361,557 \text{ MWd} \times 0.97 = 434,881 \text{ kg U-235}$ .

The appendix 3d gives the total balance of highly enriched uranium received at BR2.

27. Status of cooperation between reactor operator and Argonne

National Laboratory in reduced enrichment program (RERTR):  
We have maintained the contact with the ANL representatives, for collaboration in the RERTR program, although there is some delay in the testing of very high density fuel plates. We cooperate also closely with the fuel fabricators mainly on the performances of our fuel elements (fission products release, corrosion, cladding, behaviour ...).

28. Status of agreement between reactor operator and ANL to reduce enrichment:

Agreements and commitments for a joint study between the Belgian Nuclear Research Centre and the Argonne National Laboratory (RERT program) on the utilization of LEU fuel elements in the BR2 reactor are effective: contract signed January 22, 1985. The first phase of the program has demonstrated the theoretical feasibility for irradiation of a LEU fuel element test in the BR2 core and has been terminated with the first approval by the Safety Authorities, by the presentation of the Safety Analysis Report at 8th March 1988. The research on technical feasibility is in progress. The analysis of this test will assess the modification in the performances and in the safety, with corresponding economic implications. The schedule for BR2 test elements is given at appendix 4.

29. Status of cooperation between reactor operator and IAEA reduced program: The Belgian Nuclear Research Centre as reactor operator participates regularly at the consultant's meeting organized by the IAEA for the reduced enrichment program.

Appendix 1.  
1.8 Actual and foreseen duty factor

	Actual			foreseen		
	1988	1989	1990	1990	1991	1992
Date of begin	16 Dec 87	15 Dec 88	15 Dec 89	03 Oct 90	9 cycles of	10 cycles
Date of end	15 Dec 88	15 Dec 89	02 Oct 90	02 Jan 90	21 days	21 days
end of cycle	13/88A	13/89A	10/90A			
time of the year [day]	365.3	365.0	292.7	90	365	365
operation (1) [day]	167.6	101.2	146.8	2 x 21	189	210
duty factor	0.46 (2)	0.50	0.49 (3)		0.52	0.57 (4)
energy produced	10.958	11.504	9924 + 2 x 1300		~12.000	~13.000
number of fresh fuel elements loaded	68	78	56 + 2 x 6		~75	~81
mass of fresh U-235 [kg]	26.9	31.2	22.4 + 4.8		~30	~33

Remarks:

1. The operating time is defined to be the time when the reactor has a power > 80 % nominal power for normal cycle and > 1 % nominal power for special campaign.
2. At the end of year 1988 the available stock of fresh fuel elements was zero and the number of reactive (B and Sm burnt) partially burnt fuel elements (10 < B < 25 %) was minimum.
3. From cycle 9/90, the radioisotopes production has been adapted for cycle length of 21 days, permitting installation of the CALLISTO loop equipment and heavier electromechanical maintenance in the BR2 complex, anticipating the renewal of the reactor at the end of the year 1995.  
Because the <sup>3</sup>He rising rate increases with the cumulated energy produced with the Be matrix, the duty factor must increase above 50 %.
4. The CALLISTO loop programme will begin irradiation in October 1991; the duty factor should be higher than 0.55.

§ 28. Approximate schedule for BR2 test elements at November 1989.

	Approximate time required (months)	Approximate completion date
1. First approval of Safety Report.		8th March 1988
2. Finalize detailed specification		26th April 1989
3. Fabrication feasibility reports from CERCA and 2nd approval of Safety Report.		December 1989
4. Fabricate test fuel elements.	12	December 1990 pending.
5. Reactivity and flux measurements in BRO2 Critical Facility Third approval of Safety Report.	3	January 1991 March 1991
6. Irradiation in BR2	18	July 1992
7. Cool irradiated elements.	4	September 1992
8. Post-irradiation-examination	3	January 1993

The key uncertainties in this schedule are the dates for finalization of the specifications by CERCA and the dates by which CERCA will be able to deliver the finished elements to BR2.
